NEW YORK, THURSDAY, JULY 6, 1905

No. 2953

Survey of the World

Death of Secretary Hay

Secretary John Hay, of the State Department, died unexpectedly and suddenly at 12.25 a.m. on the 1st at his summer home on the shore of Lake Sunapee, in New Hampshire. The cause of death was pulmonary embolism. Mr. Hay returned about three weeks ago from Europe, where for several months he had been seeking to regain his health. His condition was greatly improved, and his friends expected that in the autumn he would take up his work in Washington. On the 24th ult. he arrived at his summer home, suffering from fatigue and a cold. He was so ill on the following day that physicians were summoned from Boston by telegraph and brought him to Lake Sunapee by special train. But his ailment yielded to treatment and it was soon announced that within a few days he would be out of doors. The day preceding his death was one of continued and satisfactory improvement. A few minutes after midnight, however, he became alarmingly ill and called his attending nurse and physician. No relief could be given, and he passed away before any member of his family, except Mrs. Hay, could be brought to his bedside. He was nearly 67 years old. Mr. Roosevelt was greatly shocked. "The American people," said he, "have never had a greater Secretary of State, and his loss is a national calamity." Secretary Taft had started for the Philippines and was passing through West Virginia when he heard of Mr. Hay's death. It is generally expected that he will be placed at the head of the State Department.

**Beef Trust
Officers Indicted**

At the close of an investigation which was begun more than five months ago the Federal grand jury in

Chicago has indicted the five leading corporations of the so-called Beef Trust and eighteen prominent officers of them. The corporations and persons indicted are named in the following list:

Armour & Co.—J. Ogden Armour, president; Arthur Meeker, general manager; T. J. Connors, general superintendent; P. A. Valentine, treasurer; Samuel A. McRoberts, assistant treasurer; Charles W. Armour, president of the Armour Packing Company.

Swift & Co.—Louis F. Swift, president; Edward F. Swift, vice-president; Charles H. Swift, director; D. E. Hartwell, secretary; Lawrence A. Carton, treasurer; Arthur F. Evans, attorney; R. C. McManus, attorney; A. H. Veeder, general counsel.

Cudahy & Co.—Edward Cudahy, vice-president and general manager.

Nelson Morris & Co.—Edward Morris, vice-president; Ira N. Morris, secretary.

Schwarzschild & Sulzberger.—B. S. Cusey, traffic manager; Vance E. Skipworth and C. E. Todd, his assistants; Samuel Weil, secretary. These are indicted for soliciting and accepting rebates from six railroad companies.

It is charged in the indictments and the jury's report that the defendants violated the Anti-Trust law by combining to prevent competition in the purchase of cattle and in the sale of beef, canned meats and dairy products. The methods by which this was accomplished, both in the export trade and in the domestic market, are described. In the rebate cases several unlawful transactions are set forth, with dates, figures and other details.

**Mr. Rockefeller's Gift
for Education**

It was made known at a meeting of the General Education Board, on the 30th ult., that John D. Rockefeller, President of the Standard Oil Company, had given to the Board

\$10,000,000 as an endowment fund. This sum is to be paid over on October 1st in cash or in income-producing securities, and the income is to be used (as a letter from the donor's representative says) "for the benefit of such institutions of learning, at such times, in such amounts, for such purposes, and under such conditions, or employed in such other ways, as the Board may deem best adapted to promote a comprehensive system of higher education in the United States." The Board was organized in February, 1902, under a national charter, and at that time Mr. Rockefeller gave to it \$1,000,000, especially designated for educational work in the South. To such work the labors of the Board have thus far been confined. The sum originally given could be distributed, but only the income of this later gift can be expended. The first gift was designed for common schools and secondary education; this large endowment is for higher education and is designed especially for colleges, altho the great universities are not excluded. In a published statement the Board says:

"Both gifts are alike available for denominational schools, as well as for those which are non-sectarian. While the funds may be employed for denominational schools, they will be employed without sectarian distinctions. No special denomination will be particularly favored, but the funds will be open to approved schools of all denominations, altho they cannot be employed for giving specifically theological instruction. In distributing the funds the Board will aim especially to favor those institutions which are well located and which have a local constituency sufficiently strong and able to insure permanence and power. No attempt will be made to resuscitate moribund schools or to assist institutions which are so located that they cannot promise to be permanently useful. Within these limits there are no restrictions as to the use of the income. It may be used for endowment, for buildings, for current expenses, for debts, for apparatus, or for any other purpose which may be found most serviceable."

The present members of the Board are Robert C. Ogden, chairman; George Foster Peabody, treasurer; Wallace Buttrick, secretary and executive officer for the South and Southwest; Starr J. Murphy, secretary and executive officer for

the North and West; Frederick T. Gates, Daniel C. Gilman, Morris K. Jesup, Walter H. Page, Albert Shaw, John D. Rockefeller, Jr., Hugh H. Hanna, William R. Harper and E. Benjamin Andrews.—At the Yale alumni dinner in New Haven, on the 28th, President Hadley announced that Mr. Rockefeller had given to the university \$1,000,000, the only condition accompanying the gift being that the money should be invested and the principal preserved inviolate as an endowment, while the annual income might be used for current expenses. At the same time it was shown that another million had been given by certain graduates. On the preceding day, at the alumni meeting, Senator Brandagee had said, in the course of an address:

"Bring on your tainted money! We will purify it with the Yale spirit and consecrate it to the blessed mission of educating noble men to uphold the institutions of our glorious country."

It was on the 28th that Mr. Roosevelt, in an address to the alumni of Harvard, made some remarks which certain newspapers have published in juxtaposition with their report of the Yale gift. He was severely criticising the very rich men who "commit crimes of greed and craft on the largest scale by evading the law or by breaking it so cunningly that they cannot be discovered." Men "of vast fortune," he said, "should set an example by paying scrupulous heed not only to the letter but to the spirit of the laws and by acknowledging the moral obligations which cannot be expressed in law, but which stand back of and above all laws. It is far more important," he added, "that they should conduct their business affairs decently than that they should spend the surplus of their fortunes in philanthropy." He also attacked the "influential and highly remunerated members of the bar who make it their special task to work out bold and ingenious schemes by which their very wealthy clients, individual or corporate, can evade the laws which are designed to regulate the use of great wealth in the interest of the public."

**Labor Leaders and
Employers Accused**

In Chicago a grand jury of the county has indicted 49 men as a result of its inquiry concerning the teamsters' strike and other labor controversies. Forty-seven of these are officers of labor unions and two are employers—the president (George C. Prussing) and the purchasing agent of the Illinois Brick Company. The two employers are accused of conspiring with the presidents of certain unions (who are indicted with them) to injure the business of independent rivals by hiring the union officers to call strikes against them. It is charged that \$25,000 was so used. Cornelius P. Shea, president of the Brotherhood of Teamsters, and a dozen officers of the branches of this organization are indicted for conspiracy to injure the business of Montgomery Ward & Co. Thirty-two members of the Teamsters' Union are held for assault with intent to kill or to commit bodily injury. The jury's report upon labor conditions in Chicago is a statement of extraordinary character. It shows that large sums have been paid, in response to demands of labor leaders, to prevent or to settle strikes; that much of the money was spent in dissipation; that Shea (leader of the present strike) has been a blackmailer; that Albert Young, his predecessor in office (also indicted), profited by similar transactions; that other officers had shares of the money so procured, and that ruffians, or "slug-gers," have been employed by the officers of certain unions. The present strike, it says, was "conceived in iniquity," and "a very few of the principals at the head of the teamsters' union have been responsible" for it "in order that their pockets might jingle with unholy gain."

**Engineer Wallace's
Resignation**

The resignation of John F. Wallace, chief engineer of the Panama Canal, has been the subject of much discussion, official and otherwise. He is now no longer in the Government service and John F. Stevens has been appointed in his place. Mr. Wallace arrived in New York from the Isthmus on the 22d ult., and on the 25th he had a long interview with Secretary Taft, who published, four days later, a

report of nearly 4,000 words as to what was said and done at that meeting. Mr. Wallace said the presidency of a large holding company, with a salary of \$65,000, had been offered to him. The place was a very desirable one and he desired to accept it. Life on the Isthmus was not enjoyable and was not without risk to himself and his wife. He could make his annual report and withdraw from the canal work within two months, and he wanted to do so. The long verbatim report of the Secretary's reply shows that he was moved by indignation. He sharply attacked the engineer for deserting so suddenly "at a critical moment," reminding him that he had warmly approved the reorganization of the Commission, with its new distribution of duties and powers, and that the plan of it was based in part upon his own suggestions. Mr. Wallace had expressed such approval as late as May 26th, and then, on June 5th, only twelve days after his arrival on the Isthmus, had cabled for permission to return in order that he might resign and take another place:

"For mere lucre you change your place over night, without thought of the embarrassing position in which you place your Government by this action, when the engineering forces on the Isthmus are left without a real head, and your department is not perfected in organization; when the Advisory Board of Engineers is to assemble within two months and when I am departing for the Philippines on public duty. All this you knew, but you have thought of yourself and of yourself alone."

Mr. Taft said much more in the same strain, and then required the engineer to tender his resignation "at this moment." This Mr. Wallace proceeded to do, and the resignation was promptly accepted by the President in a letter approving the Secretary's course. Mr. Wallace has since published a long statement in which he says his motive was not financial, but he withholds the reasons for his resignation. The offer came to him, he says, after he had been considering for some days whether he ought not to resign. He denies the assertion of Secretary Taft that he sought the office which he has given up, saying that he accepted it with great reluctance and felt free to withdraw from it. He also says:

"I have made no criticism of individuals, but

I do believe that the obstacles due to the Governmental methods required by existing laws are so serious that they will have to be eliminated if the American people are to see the Panama Canal constructed in a reasonable time and at a moderate cost."

Reports that the offer to him came from the Ryan or Belmont interests in New York have been authoritatively denied. It is said to have been made by a company engaged in railway construction. Mr. Stevens, whose salary is to be \$30,000, or \$5,000 more than Wallace's, had been retained by the Government as an expert to supervise the construction of railroads in the Philippines. He has been the engineer officer of several Western roads and for several years the chief engineer of the Great Northern, the Rocky Mountain division of which was built by him. He has not been made a member of the Commission. He is only to execute the plans made by the Commission and the Advisory Board. It is understood that Chairman Shonts has declined two offers, each of them involving a salary of \$100,000. He says: "Having promised to sit in this game, I will play my hand." The Commission has bought two American steamships from the Ward Line at \$650,000 apiece.

Eight Men Lynched in Georgia

Seven negroes and one white man were taken from the jail at Watkinsville, Ga., at about 2 o'clock on the morning of the 29th ult. by a mob and lynched. Another negro escaped with his life only by pretending to be dead after his associates had been killed. The mob had intended to kill all the prisoners who were in the jail, but one negro who had been arrested for gambling was overlooked. Four of the mob's victims—John Aycock, white, and Richard Robinson, Lewis Robinson and Claude Elder, negroes—had been imprisoned upon the charge that they had murdered an aged farmer, named Holbrook, and his wife. Another, Richard Allen, was under sentence of death for the murder of one of his own race. Eugene Yerby had been locked up for burglary, Sandy Price for assault upon a white woman, and Robert Harris for shooting another negro. The lynchers, all wearing masks, came into town quietly (from an adjoin-

ing county, it is said) and began their work by capturing the Town Marshal at his home. They took him to the jail, meeting on the way a resident who in vain begged them at least to spare Aycock, against whom there was little evidence, and those negroes who were not held for capital crimes. They compelled the jailer to give up his keys, threatening to destroy the jail by dynamite if he withheld them. The nine prisoners were led away about 200 yards and bound to fence posts. There eight of them were shot to death. The ninth, Joseph Patterson, being only slightly wounded, pretended to be dead and thus escaped. Many people were awakened by the shooting, but when they arrived at the place the lynchers had disappeared. Sheriff Overby lived a mile from the jail and knew nothing of the lynching until some hours after it had taken place. It is said that the people of the vicinity had decided that they would let the law take its course in the cases of all the prisoners.

Reform in Philadelphia Israel W. Durham, the Philadelphia Boss, gave up his State office of Superintendent of Insurance by resignation last week, and David Martin, a well-known "organization" politician of the city, was appointed by Governor Pennypacker in his place. The Civil Service Reform Association of the State recently urged the Governor to remove Durham, asserting that in addition to his other disqualifications he had been absent from the Superintendent's office at the capital for more than nine-tenths of the working days of his term.—It is expected that, as a result of the investigation now in progress, 50,000 fraudulent names will be removed from the voting lists. William Yost, a judge of election; Bernard Strauss, an inspector, and William Glenn, inspector's clerk, pleaded guilty last week to the charge that they had made fraudulent lists and stuffed ballot boxes. Each was sent to jail for five months and fined \$500. George F. Little, a member of the Legislature, was arrested and held for trial on a similar charge. It is said that nearly 1,000 policemen will be removed for corruption or inefficiency.—The Councils by unani-

mous vote have repealed the ordinances which gave to the street railway companies franchises in 110 miles of street without requiring compensation. These are the ordinances which were defiantly passed over the Mayor's veto at the time when the gas lease was approved.—Experts who are examining the filtration contracts of the Durham-McNichol firm have discovered a fraudulent payment of \$233,000 and have also ascertained that all but \$44,000 of the \$979,000 which, being 20 per cent. of the price on some of the contracts, should have been held in the Treasury until the satisfactory completion of the work, has been paid to the contractors. On one of the contracts the official estimate of cost was \$495,000, but the ring's successful bid was \$1,146,000.—Pennsylvania newspapers are commenting upon the recent trial and conviction of five school directors in Shenandoah, who have been sent to prison for one year because they sold the appointments of teachers.—In Milwaukee, Wis., a grand jury has reported 38 indictments against 21 persons—county supervisors and other public officers—for corrupt action with respect to franchises, contracts and a large variety of transactions connected with the penal and charitable institutions and other branches of the public service.

The College Oarsmen

On both days of the university boat races the weather was all that could be desired. Six universities were represented on the Hudson at Poughkeepsie, on the 28th ult. Cornell won both the eight-oared races (university and freshman), but Syracuse was second in these contests and first in the race for fours. The skill and strength of Cornell's university eight were clearly shown in a race that ended with her boat more than 15 lengths in advance of the nearest competitor, the respective times being 20:29 2-5 and 21:47. The remaining crews were really in a race by themselves, with Syracuse leading and the others near at hand in the following order: Georgetown, Columbia, Pennsylvania, Wisconsin. In the two mile race for fours Cornell and Syracuse were only two seconds apart,

and the time (10:15 2-5) established a new high record on this course. On the following day Yale and Harvard met on the Thames. In the morning the races for university fours and freshman eights were pulled, and Harvard won both of them, but was leading by only 5 seconds at each finish. The great race of the day, for university eights, was rowed late in the afternoon and was one of the finest contests ever seen on the river. Almost continuously from start to finish the boats were overlapping, but Yale kept the lead and won by less than 3 seconds.

Norway and Sweden

Strong opposition is being manifested in Sweden against the acquiescence of King Oscar in the secession of Norway from the Union and war is threatened. Neither house of the Swedish Riksdag supports the Government in its peace policy. In the Senate the Government bill for negotiating a legal separation from Norway was referred to a committee composed of nine anti-Government and three pro-Government members, while in the lower house the corresponding committee consists of five pro-Government, five anti-Government and two independent members. Baron Kennedy, speaking on the question in the Senate, said:

"If the King's message expresses his opinion, he has lost two crowns instead of one."

This sentiment was cheered by the opponents of the Government, but Judge Kronlund rebuked Baron Kennedy and called his remark treasonable. Premier Ramstedt held that the only wise policy was reluctantly to accept dissolution. A conquered Norway would be of no advantage to Sweden, but a continuous source of danger. King Oscar has announced that he will not consent to placing a prince of the House of Bernadotte upon the throne of Norway unless the Swedish Riksdag should request him to do so. The Norwegian army has been mobilized and brought near to the Swedish boundary, tho it is officially explained by the Norwegian War Department that these are merely the ordinary practice maneuvers. On the other hand, the Swedish Navy Department has several

gunboats cruising along the Norwegian coast, and a proclamation has been issued declaring the harbors of Stockholm, Kariskrona, Gothenburg and Farosund to be war ports and excluding all foreign naval vessels from them.

The Peace Envoys

The President announced July 2d the appointment of the plenipotentiaries by Russia and Japan, and stated that they would meet in Washington as soon after August 1st as possible. The Russian plenipotentiaries are Ambassador N. V. Muravieff, now at Rome, and Baron Roman Romanovitch Rosen, recently appointed Ambassador of Russia to the United States to succeed Count Cassini. The Japanese plenipotentiaries are Baron Jutarō Komura, now Minister of Foreign Affairs, and Kogaro Takahira, now the Japanese Minister to the United States. All but one of these are well known in the United States, and all speak English easily. Baron Rosen is of Swedish ancestry, his ancestors having followed Gustavus Adolphus in his invasion of Russia and settled there. He was Chargé d'Affaires at Tokyo and later at Washington, and was Minister to Japan from 1893 until the outbreak of the war. He was opposed to the war and is highly esteemed by the Japanese. Mr. Muravieff was born in 1850 and is a member of an ancient Russian family which has held estates in Novgorod since 1488. He is one of the leading authorities of the world on international law and was appointed one of the arbitrators of The Hague Court in the Venezuela case. Here as President he delivered the decision in the case, on which occasion he referred to the outbreak of the war in the following words, which in consideration of the fact that he was acting in a judicial capacity as the mouthpiece of an international tribunal were regarded as discourteous to Japan:

"This conflict is a serious setback to the cause of progress. In spite of the highest aspirations no nation is free from the danger of attack from an unexpected quarter. War is justifiable only as an act of self-defense, where it is necessary to uphold honor or liberty, but a just Providence will decide between righteous claims and mere frivolous pretensions."

As Minister of Justice he reformed the

judicial system of Siberia. Baron Komura was educated in the United States and was the predecessor of Mr. Takahira at Washington. He was Minister to Russia until the war between China and Japan, when he was called to Tokyo, and afterward sent as Minister to China. Mr. Takahira was born in 1854 and was educated at the Imperial College of Tokyo. He was sent to Washington as attaché in 1879 and he rose to Chargé d'Affaires. He has also served in diplomatic and consular posts at Seoul in Korea, Shanghai in China, at The Hague, at Rome and at Vienna. He was one of the negotiators of the Treaty of Shimonoseki, which closed the China-Japanese war.—Russia's reluctance to grant her representatives any powers further than to receive and transmit proposals for peace has evidently been overcome in some manner, for it is announced that

"the plenipotentiaries of both Russia and Japan will be entrusted with full power to negotiate and conclude a treaty of peace, subject, of course, to ratification by their respective home Governments."

Russian Riots and Strikes

Sporadic outbreaks of violence continue to occur in many parts of Southern and Eastern Russia, in both cities and country, but as there appears to be no unity of purpose or systematic co-operation they show no signs of developing into a definite revolutionary movement. At Lodz and Warsaw order reigns, according to the proverbial manner, owing to the vigorous enforcement of martial law. It is officially reported that there were 500 killed and 1,000 wounded in the riots at Lodz. A secret meeting of revolutionary socialists, in a forest near Lodz, was surprised by the Cossacks, who fired upon the crowd and wounded 18. In Warsaw barricades were raised and a general strike declared, but the troops cleared the streets and arrests were made of 672 persons, mostly Jews; several have been executed. The Polish nationalists and many of the labor leaders are opposed to violence, as they believe that such premature and ineffectual outbreaks only do harm to their cause. Mutinies occurred among the sailors and marines at Libau and Kronstadt, but they

did not assume the importance of that at Odessa. At Libau the mutiny started because of poor food served to the sailors, who to the number of 5,000 rebelled and seized the guard house and offices, thus securing arms and ammunition. They took refuge in the forest, where they were surrounded by infantry armed with machine guns and forced to surrender under promise of better food. A large amount of property was destroyed. At Kronstadt, the most important of Russian navy yards, 8,000 imperial sailors mutinied because they had been required to do work in the repair shops, and the workmen struck in sympathy, but they were soon brought under control.

Mutiny on a Russian Battleship

An almost unprecedented incident in the history of revolutions, a naval mutiny in combination with a street insurrection, occurred at Odessa, the principal sea port of Rus-

sia on the Black Sea. The "Kniaz Potemkin Tavritchesky," the largest battleship of the Black Sea fleet, steamed into the bay of Odessa from Sevastopol on the night of June 27th flying the red flag of revolution. The crew had revolted and killed or imprisoned such officers as would not join them. Eleven officers are said to have been liberated in Odessa and 22 killed. The whole number of persons on the ship was 636. For several days the city of Odessa had been in a state of tumult, fired by the riots of Lodz and Warsaw, and the mutineers of the "Kinaz Potemkin" put themselves in communication with the strikers and Socialists, and, it is reported, aided them against the Cossacks by landing machine guns and marines to take part in the street fighting. The authorities were powerless, because Odessa is not a fortified city and the 12-inch guns of the battleship commanded the whole water front. Two torpedo boats and a

transport also joined in the mutiny, and the Russian steamer "Esperanza," lying in the harbor, was captured and its cargo of 2,000 tons of coal transferred to the battleship during the night. The immediate cause of the mutiny is said to have been dissatisfaction with the poor quality of the soup furnished. When a delegation of sailors went to the mess officer to remonstrate he shot immediately their leader, Omelchuk, whereupon the crew revolted and seized the ship. On reaching Odessa the body of Omelchuk was taken ashore and placed upon the new mole, with an inscription stating that he was a martyr to a just cause. The Governor of Odessa was notified that the city would be

Map of Odessa.—The Rebel Battleship Anchored in the New Harbor.

bombarded if the body was disturbed, and all day long it lay in state and was visited by thousands. A basket for contributions to aid the revolutionary cause was placed at the head. On the following day a public funeral was held, and the body of Omelchuk was carried through Preobrajensky Street to the Military Cemetery by eight sailors, preceded by priests and followed by a procession of many thousand persons. Under threat of bombardment the police and troops stationed along the route dared not interfere, the Port Admiral offering himself as hostage that the band and escort from the battleship should be allowed to return safely. The "Kniaz Potemkin" refused to permit any of the Russian ships to leave the port, and several were burned by the rioters, who systematically looted and set fire to all the custom houses, stores, offices and shipping, extending for a mile along the quays. Women and young girls were seen, as in the Paris Commune, piling up wood and straw in the doorways, saturating them with petroleum and setting them on fire. Several hundred persons are reported to have been burned to death. In other parts of the city the mob, estimated at 12,000, was held in check by the troops, who mowed them down with machine guns. The greatest bloodshed was near the church of St. Nicholas. Two shells were fired from the mutinous battleship, one striking a house in Nyesjinskaga Street and the other a brewery, both tearing large holes in the sides of the buildings. Except for the light from the conflagration the whole city was in darkness, as the gas and electricity were shut off by the authorities. Admiral Kruger, with the rest of the fleet from Sevastopol, composed of five battleships and torpedo boats, arrived on Friday, and the "Kniaz Potemkin" steamed out to meet them, with her decks cleared for action. She passed at full speed through the midst of the fleet, so close to the vessels which surrounded her that faces could be distinguished, but no shot was fired on either side. Admiral Kruger signalled her to join the fleet and return to Sevastopol, but she replied "We remain here." The bat-

tieship "Georgi Pobiedonosetz" then joined the mutinous vessel and signalled that she was obliged to go to Odessa to execute repairs. Admiral Kruger, doubtless fearing further desertions, thereupon returned to Sevastopol, where after a council of admirals and captains it was decided to put the fleet out of commission. Accordingly the machinery was ungeared and officers and men given shore leave. The "Kniaz Potemkin" and the "Georgi Pobiedonosetz" returned to the bay of Odessa, where the latter landed her officers, except the captain, who had suicided. One July 3d the mutineers surrendered the ship. The "Kniaz Potemkin" and her torpedo boat left Odessa for Kustenji, Rumania, about 200 miles southwest of Odessa, and sent a boat ashore asking for provisions and water. They were permitted to purchase food, but were ordered by the Rumanian authorities to land and give themselves up to be held as Russian deserters.

The Arabian Rebellion

The Imam of Yemen seems to have established a settled Government in the country he has wrested from the Sultan of Turkey, and the ancient laws of the Koran are being strictly enforced on Mohammedan and Christian alike. Wine drinking and licentiousness are forbidden and punished. Tithes of all the crops are collected, and a tax of 2½ per cent. is levied on movable property, live stock and houses. The Imam with a body-guard of 3,000 men resides in the city of Kamkahan on a high mountain, accessible by a single pass. Since the capture of Sanaa the Zaidees have submitted to his authority, which now extends from the boundaries of the British protectorate of Aden to Ibb and Tais, and opposite Hodeida to within 50 or 60 miles of the coast of the Red Sea. Altogether he commands a force of some 150,000 men. The Sultan of Turkey is making great efforts to recover the province, but success is not yet in sight. The first expedition sent to the relief of Sanaa under Ali Riza Pasha was captured with that city April 30th, and the fate of Riza Pasha is unknown.

The Enforcement of Law

BY JOSEPH W. FOLK

[Soon after Governor Folk's inauguration he took steps to insure the enforcement of the Sunday laws. In St. Louis the saloons have been scrupulously closed every Sunday since and including April 16, and the same condition prevails almost without exception in the smaller towns of the State. In this respect the Governor is carrying out his duty with the same firmness which he displayed in his celebrated prosecution of boodle and bribery cases when he was Circuit Attorney of St. Louis. The following article is from an interview.—EDITOR.]

IN the State of Missouri we have now in operation what is called the Missouri idea—the idea that public officials should answer at the bar of public opinion for all official acts—that the man who in his official life betrays his people is a criminal, and that laws are put upon the statute books to be observed, not to be ignored.

In proportion as the average morality in a State is strong, just to that extent is the State great, and good government reigns. Laws that are put on the statute books must be put there for some purpose. Laws that are not enforced add just as much to good government as sores do to the strength of the human body.

Many men observe those laws which they like and disregard those laws which are obnoxious to them. The trust magnate looks with abhorrence on the pick-pocket who violates the larceny statutes, but thinks that he himself has a perfect right to break the laws against combinations and monopolies. The burglar detests the law-breaking of the trusts, but thinks the law against house-breaking unjust and unfair. The boodler considers the law against bribery as

an interference with his personal rights, but he demands the rigid enforcement of the law against the man that steals his property. The dram-shop keeper thinks that the law against murder is a good law, but the law requiring his dram-shop to close on Sunday is Puritanical and tyrannical and a "blue" law. It has been my experience that any law looks "blue" to a man who wants to break it.

So it goes. Men obey the laws that restrict the other fellow, but laws regulating their own conduct they regard as interfering with their rights. If every man were allowed to judge for himself they like and disregard those laws which which laws are good and which laws are bad and to ignore the bad laws, as he sees them, we would have anarchy.

There would be no laws at all. That is the spirit of the mob, which hangs a man because it thinks he is a bad man. Yet if each individual were given the right to put out of the way every person that he thinks is not a good citizen no man's life would be safe. The only proper test is to enforce every law upon the statute books. If the law be a bad law, the remedy is to repeal it, not to ignore it.

No official has a right to ignore any law. It is not for

JOSEPH W. FOLK

him to say whether the law is good or bad, but it is for him to enforce it as he finds it on the books.

A great deal has been said in Missouri in the last few weeks about what is commonly called the "lid." The "land of the lid" means the land of law. When people talk about taking off the "lid" on Sunday, they mean to let the law be violated with impunity. They mean for officials to violate their oaths of office and to cast away the obligations that they took when they entered office. If we take the "lid" off of the Sunday law, can we not with equal propriety take the "lid" off of the larceny statute and off of the murder statute? Then we would have anarchy.

The greatest danger to every government lies in the fact that laws that are made are not enforced as they are made. There has been entirely too much making of laws to please the moral element and then allowing the laws to be ignored to please the immoral element.

My convictions may be termed idealistic, but ideas and ideals are the life of a free people. We are made and governed by the things we cherish. The public life of a nation is but a reflection of its private life. No government was ever better than the people made it nor worse than they suffered it to become. Without moral vigor material strength counts for nothing, resources count for nothing. The empire of Rome built highways and constructed splendid cities while her civilization was declining. She erected barriers against the barbarous hordes who surged over them while the strength of Roman character ebbed

away, and when that was gone there was nothing to defend, there was nothing to conquer.

There is an old tale of an Eastern king who caused a magnificent palace to be erected as the abode of his majesty and power. Stone by stone the structure grew, and the heart of the king swelled with pride. One morning the palace was found in ruins. Not one stone stood upon another. "What great treason has been accomplished here?" the king exclaimed, and a price was set upon the head of the traitor who had destroyed the abode of majesty. But a wise man of the court said to the king: "Great Master, there was no treason here. Your house that was great and mighty has fallen down because the builders used mortar without sand, and the work that they did has come to ruin."

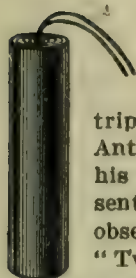

So with the State. External grandeur counts for nothing, if we ignore those vital principles of morality and of law that give life to a State. We may count our wealth as the sands of the sea, the domes of our capitol and the spires of our churches may pierce the sky and glitter among the stars, yet all must fall, all must crumble away like the palace of the ancient king, unless it be welded together and strengthened by those moral principles that are the foundation of an enlightened citizenship. When corrupt principles are allowed to influence public acts and selfish considerations deter the people from upholding the laws and from giving their best efforts to the public good we are making mortar without sand.

JEFFERSON CITY, MO.

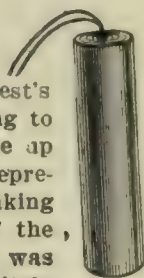

Port Arthur Three Months After the Surrender

BY J. H. DE FOREST, D.D.

[This is the first article promised to our readers as the result of Dr. De Forest's trip to Manchuria. His journey from Port Arthur to Mukden and from Niuchwang to Antung rather "took the starch out of him," he writes, and he was obliged to give up his journey through Korea. As Dr. De Forest traveled as a war correspondent representing the Y. M. C. A. of the Japanese Army, he had unusual facilities for making observations. Unfortunately, the manuscript of this article was in the wreck of the "Twentieth Century Limited," that occurred at Mentor, Ohio, on June 21, and was nearly burned beyond recognition. As it was, the dozen photographs accompanying it in the same envelope were so damaged by the heat as to render their reproduction useless

—EDITOR.]

IT is with intense interest that one rides from Dalny to Port Arthur. About three months after the surrender of the fortress, favored with a letter from the Minister of War, General Terauchi, another from the Governor-General of the Peninsula, and one more from Viscount Admiral Ito, I rode in a third-class car that had been brought from Japan for the use of generals, foreign military *attachés* and other guests of the army. It takes four hours to go the forty miles, and this leisurely gait gives good opportunity to see ranges of hills from Nanshan to the inclosing fortress into which the Russian forces were driven and at last forced to surrender.

The scenery along the road is exceedingly tame—those brown, treeless, monotonous hills that skirt the monotonous plains of the Pechili. But every one has its battle story; so that one feels as tho he had read a volume of history in those four hours. After a while we come in sight of the high hills, up the slopes of which we see those zigzag trenches, above which are the ruined forts and their wrecked guns. But all interest in that direction ceases when one of the Japanese officers points to a dingy stone hut on the plain and says: "There's Nogi's headquarters." Nogi, the ideal soldier of Japan! He's more than trenches and guns. In that hut he endured the bitter cold of winter without a fire, refusing to have even a *hibachi* with a bit of live charcoal in his room, preferring to light his cigarettes with matches. "The soldiers have no fire. Why should I?" is his practice.

"There's the cemetery," says another, and we look at what is common now in Manchuria—a large plot of ground in which are squared, unpainted posts, set in regular order, some large and tall, others short and small. The bodies of some of the dead may be there and the ashes of some more soldiers. Other bodies, hundreds of them, have had no burial, and the ashes of others of the dead, a handful for each, were sent to the homeland to rest in ancestral cemeteries and to be cared for by the priests of the family temples. I saw later on in the fortress a priest who had in charge about five hundred four-inch cubic boxes, each of which held a piece of a bone of the dead.

Just beyond the cemetery the train was stopped at the foot of Shoji San, the first fort east of the railway. Looking into the shallow trench close to the track I saw the skull of a Japanese soldier, a few bones and his blue clothes. It was a gruesome sight, and I at first wondered how the Japanese, who are so careful of and reverent toward their brave dead, could have left that body for dogs to eat. But when, a day or two later, I reached the deep trenches on the tops of the hills all thought of that solitary skull vanished at the sight of heaps upon heaps of mixed Russian and Japanese bodies, just as they fell in the desperate and prolonged charges of which the whole world knows.

At the train my Japanese Y. M. C. A. companion and I were met by a military *attaché* (for General Nishi had kindly telegraphed our coming) and taken in a

carriage to the former home of a Russian General, where we were entertained during our stay of four days. In front of the house were a dozen or more Russian guns, all the worse for contact with Shimose powder. In the house were two grand pianos in good tune, and the long dining hall was encircled with tubs of flowering shrubs from southern islands and from Japan. Suites of rooms were luxuriously furnished. Like everything Russian, the house was built of stone and brick and materials made to endure for ages, one of many signs that Russia was only joking when she assured the world that she would withdraw from Manchuria in October, 1903. The Japanese, in speaking of these imposing dwellings that occupy conspicuous sites, especially in Dalny and Port Arthur, smilingly said: "They were a present to us from the Russians."

We went at once to the Naval Commander, Admiral Shibayama, with Admiral Ito's letter of introduction, which, after the usual greetings, had the following words:

"The bearer, an American scholar, has permission from the Minister of War to visit Manchuria in the interests of Y. M. C. A. work among the soldiers. He is also permitted to visit the various battlefields. So far as is possible kindly grant him every facility for investigating everything he may desire to look into."

A launch was at once put at our disposal for visiting the half sunken warships and for going to that most interesting place, the narrow mouth of the harbor, where so many ships were sunk. The thoroughness of the blocking work reminded me of a remark made by Mr. Ozaki, Mayor of Tokyo, in an address delivered last year in the capital. Said he: "We believe in the open door everywhere—except at Port Arthur." It was indeed a rare privilege to look upon the sights of that harbor. And it was one of the saddest sights of my life to see those fatally wounded and torn battleships lying half over on their sides, with masts broken, smokestacks riddled with shot and shell, the decks ripped open, guns dismounted and machinery blown up. I went aboard the "Pallada" and from the bridge took a photo of the dangling davits, the distorted iron work and the perforated ventilators.

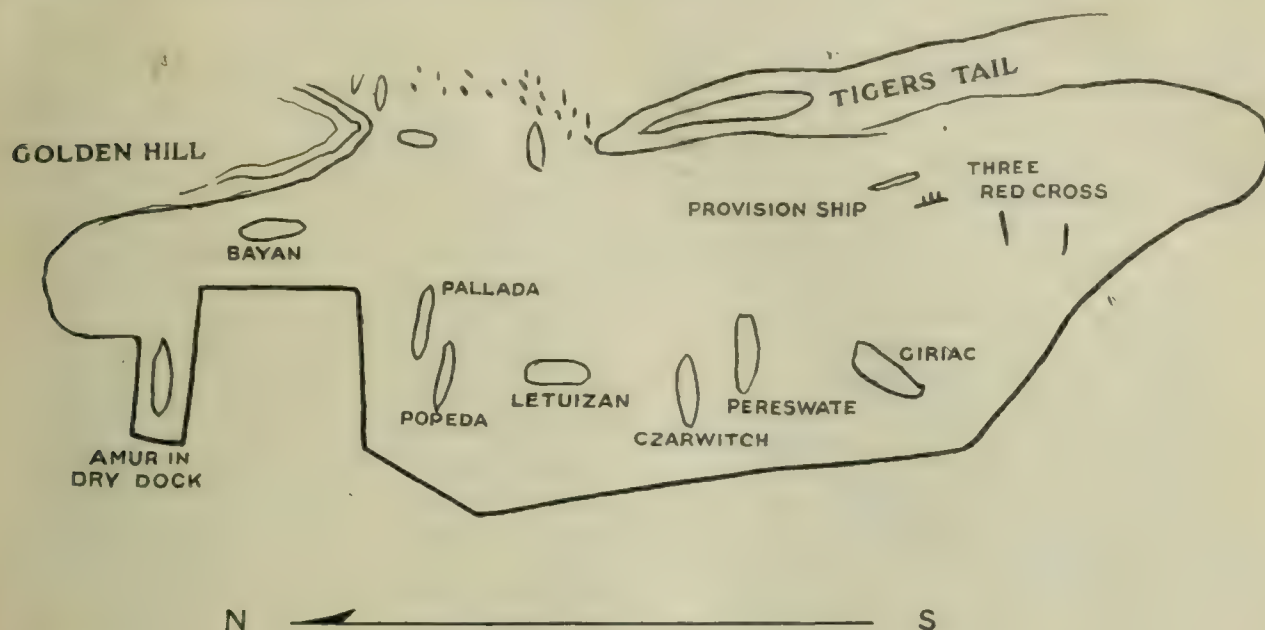

Why did not these powerful battleships save Port Arthur from that humiliating surrender? It would seem as tho they might have kept the narrow mouth of the harbor open against the combined fleets of great nations—as tho they might have crippled Togo's fleet and disputed with fair success the control of the sea. But the officers of the fleet were cowards, was the explanation that Stoessel himself is said to have given. Stoessel and his men hated the men of the navy, who, instead of fearless and resourceful co-operation, idly let their giant ships be pounded to death by Japan's eleven-inch shells. Had there been any such self-sacrificing and glowing loyalty and consciousness of right and harmony inside that fortress and harbor as were outside Japan never could have gotten in. Had Russia's navy only contained a few Hiroses and their fortress been commanded by a general who lived without a fire in dead of winter that he might keep in touch with his soldiers, instead of a man warmed by a twelve-foot Russian stove and kept safe from the winds by double windows set in brick and mortar and comforted by pianos and dances, that Japanese army would have left ten times as many graveyards as they now have on the outside of the line of fortifications.

On the train a colonel remarked: "It is our great good fortune that this war came on now, before we got caught in the luxurious living of the West. As it is, we can still live and fight on a handful of boiled rice once in twenty-four hours, as our ancestors did. But I doubt whether the next generation will be able to do it." He spoke a positive truth there. No one can follow the wake of the Russian army without seeing the love of luxury on the part of the officers everywhere. "They would quicker buy a bottle of perfumery than a field glass," said a prominent merchant. Without doubt their love of wine and women, of perfumery and dances and music and gambling cut the nerve of a soldier's life. I do not willingly write this, for there are so many splendid Russian gentlemen and scholars in the army, taken as individuals. But they are caught in an evil environment of corruption.

In the harbor are three Red Cross ships, one of which is the famous three

funneled "Kazan," said to be the largest Red Cross floating hospital in the world. These were filled with sick and wounded

and Tiger's Tail. The following is a map of the harbor as a Japanese officer sketched it for me:

Russians. "Is it right to capture Red Cross ships?" I asked an officer who was a student of political science at Yale and in Berlin. "The Red Cross is inviolable on land and sea," he said; "but these ships were captured with the Russian navy under very doubtful circumstances. They were frequently used to shelter the warships. Even after they anchored entirely apart in the shallow southern end of the harbor a provision ship anchored right behind them. We were skillful enough to sink that ship without injuring the hospital ships. Well, in all probability Russia will never get those ships."

The mouth of the harbor a little distance away looks at first sight as tho fishermen had stuck down all sorts and sizes of posts and poles for fishing traps. A forest of masts with occasional funnels appears in every direction. Later I went to the top of Golden Hill and looked straight down on that semicircle of twenty-seven sunken ships, some quite visible, as they were but a few feet below the surface. Two steamers of about 2,000 or 3,000 tons were accidentally run ashore exactly below the precipice on which I stood. They had barely missed getting into the very mouth. No opening large enough for even a small vessel was visible anywhere in that band of obstructions that lapped both Golden Hill

Then for three days we visited as much as possible of the ten-mile line of fortifications. I carried the map that Colonel Sato, who was in command of the Japanese artillery line, carried during the siege. It was impossible to visit the whole line and so I devoted myself to three of the strongest forts and the unfortified 203 Meter Hill, that is now even more renowned than any of its sister hills. A carriage was provided which took us nearly to the top of Shojusan, and from there a military road runs for miles just under the edge of the hills and close to the fortifications. At the top of Shojusan it was not the fortifications that attracted attention, for the fort part was battered prettymuch out of existence. But in one of those thirty feet deep trenches was a party of Chinese coolies digging out the bodies of Japanese and Russians, where they were buried on top of each other over ten feet deep, and I was taken, under the direction of a Japanese officer, to a place where two shallow holes received the contents of their flat bamboo baskets. "This hole is for cremating Russians and this for Japanese, so far as we can distinguish them," said the officer. He had antiseptic cotton in his nose, and I found it best to keep on the windward side of things.

It is a pressing question with the living army what to do with the dead army and

how to clean up ready for the summer sun. The frozen corpses of winter under pressure of ceaseless battles may be thrown into trenches and hastily covered with a little earth, but to leave things so for summer would be to invite a pestilence. That explains on the hills of Manchuria those scores of columns of smoke I saw wherever there had been a battle. All through Japan you see similar curling clouds of smoke on the mountain sides, but with a vastly different meaning. Here it means charcoal; in Manchuria it means pyres.

Passing the trench of the dead we entered the covered trenches, and at the door of one of these there must have been a terrible hail of bullets. By placing my hand on the ground I covered about twenty rifle bullets, so thick were they at that gateway. I had permission to photograph, provided I would not take general views. Accordingly the most of these pictures illustrate the special points of interest.

I learned a few days later that a fresh order was issued forbidding photographs of any kind. Moving on to the next fort, Niryusan, we saw the effects of the undermining the Japanese so persistently did until they made the explosion that silenced their enemy's strongest fort and left the guns and mountings and foundations in one huge wreck. Altho the Russians had a trench twenty-five feet deep outlying that battery, the Japanese dug below it, and tho able to progress only a foot or two a day, they at last got beneath the guns, with the result partly shown in the photograph.

Shelter houses well placed and holes planked with thick, heavy timbers in the sides of the hills made good places of rest for the Russian soldiers, who fought well, but who finally lost heart through their incapable officers. A few Japanese soldiers guard the guns that remain on the heights lest the Chinese come and steal valuable parts of them; for the poor Chinaman has met with heavy losses and feels it right to take all he can of the spoils. Those of the baser sort dig up the bodies of the dead and search for coins and rings and watches. They pick up every bit of brass, so that it was impossible to find a single brass clip that Japanese use for holding to-

gether five bullets, while the Russian iron clips covered the ground. All valuable relics are gone. By careful search I found two Russian bayonets and one Japanese bayonet, while pieces of broken shells were abundant everywhere, as were the steel holders of shrapnel and unexploded shells of various sizes, too heavy and too dangerous to carry away as souvenirs. One grassy section of the hill looked as tho it had suffered from violent smallpox, so thick were the holes made by the Japanese shells.

In the midst of these scenes our guide called our attention to the barbarous wire entanglements just below the forts. Wherever these were it was impossible to make a successful charge. The peculiarity of those that skirted the outer trench on Niryusan was that the broad belt of tangled wire tied to posts a foot or two high was strung with empty tin cans—milk cans, beef cans, etc.—made into cowbells by fastening in each a bullet; so that any attempt to crawl through in the night would make a tinkling that would bring a deadly shower of bullets in that direction.

At last, riding down the road over which General Stoessel used to make his rounds, one could but marvel at the surrender of such a line of fortresses, with some 30,000 soldiers within, and at the difference between the men who conquered and those who were defeated. I did not hear an unkind or contemptuous word about the Russians during the six weeks I was with the army, save at Port Arthur, and then it was merely a word on the conduct of the officers, and even so, not for cowardice or inability, but for greed and selfish luxury.

What a contrast with Japan's soldiers in the case of prisoners alone! There are not 500 prisoners in the hands of Russians, while there are over 60,000 Russians in Japan, besides the thousands of wounded still remaining in the Japanese hospitals of Manchuria. "Do Japanese ever surrender?" I inquired of one of the generals. He raised his eyebrows at the last word. "Surrender? Occasionally a man is overpowered and captured before he can help himself, but surrender? No Japanese ever does that."

The same holds true of the navy. I met a sailor and asked him to what ship

he belonged. Smiling, he said he belonged to none, as his ship had gone to the bottom. He went on to say that it was the "Hatsuse," that struck a mine off Port Arthur and in a twinkling the battleship sank with 800 marines aboard. Some 300 floated up and were eventually rescued. But as the Russian torpedo boats came steaming toward them the captain, floating on a plank, called out to all within hearing: "Let no man be taken prisoner. You have your knives. If not, bite out your tongues and sink!"

With such an army besieging that line of defenses by land, and with such a navy shutting off all help from the sea, there was nothing to do but surrender. And nearly three months later the officer in charge of the remaining Russian prisoners read me his daily report as follows:

PORT ARTHUR, March 23, 1905.

Russians still in hospitals.....	2,916
Of this number those fully recovered...	16
Total number of surgeons, nurses and	
Red Cross attendants.....	1,191

Grand total in Port Arthur.....4,107

Those who regain health and ability to serve as soldiers are treated as prisoners of war and sent to Japan. The total thus sent to Japan was 7,911. But those who recover health, yet are by reason of wounds unable to serve as soldiers, are forwarded to Chefoo and passed over to the French Consul there. The total number thus returned to Russia up to March 23d was 2,916.

A day or two later the train took us out to the fortress along the foot of Shoji, Niryu, and taller Bodai, all of whose sides were cut with a large portion of those 55 miles of trenches dug by Japanese. High up against the blue sky useless cannon projected here and there from the silent forts. The smoke of several funeral pyres was plainly visible on the hillsides. Men who had repeatedly seen Nogi's headquarters leaned toward the windows to see his low, cheerless stone hut once more. And far off to the west loomed the double peaked 203 Meter Hill, visibly crowned with the simple signs that mark the dead in that burial ground.

KOBE, JAPAN.

The Chicago Strike

BY A TEAMSTER

[The following article presents something of the life of the average teamster. The writer prefers not to have his name used.—EDITOR.]

AFTER I had worked as cash boy when a little chap, left an orphan, I improved my chances by becoming a grocer's clerk. I had by that time grown to be quite a chunk of a lad, and my new job included the delivery of goods with the grocer's wagon. I took care of my horses and the barn and became very much attached to the animals.

One of the horses was my particular pet. He would permit no familiarity from anybody but me. He knew me, my step and voice and would prance about in his stall when I came in the morning, lay back his ears and show his big, strong teeth in a way that to others would have

been a danger signal but to me meant his morning salutation. I would go fearlessly into his stall, pat his flank and shoulder and neck, ending by feeding him a lump of sugar. He sulked and was stubborn when driven by any one else, but for me would do anything I asked. He seemed to understand when I talked to him. I guess most horses must understand me, for they are all my friends.

I worked for the grocer seven years; got up between 5 and 6 in the morning, looked after the horses, had my breakfast and was out with my wagon soon after 7. I frequently did not get through until 9 or 10 at night, but I liked the work and my employer was a good man.

He paid me \$6 a week and boarded me. It was really the only home I had had since my early boyhood, so when the grocer failed in business I felt as sorry over it as he did himself.

I next got a job with a department store, first as helper and afterward as driver. About that time the teamsters formed a union and I became a charter member of the delivery wagon drivers' branch. Through the influence of the union we got a regular scale of wages, the first year \$12 a week and after two and a half years \$15 a week as the minimum. We have nothing to do with the care of the horses. When a wagon is taken to the barn after the day's work is finished the "inside" men take charge and we have nothing further to do until the next morning, when we find our teams hitched, ready waiting for us to start right out.

I make one exception to the regular rule, however. I go to the barn a while before leaving time and personally grease my wagon. My reason for this is because I want it to run without grinding. I have learned just what attention the wagon requires and I find I can do the

greasing more satisfactorily myself. After I have fixed it up the wheels run along easily and without "catching." A driver gets to know his wagon, what it requires and what it can do, just as a locomotive engineer knows his engine.

If there is a hitch anywhere he recognizes the cause of the trouble at once; so sensitive does a driver become to the smooth running of his wagon that he can actually tell the instant a boy catches hold of the tailboard as he drives along the street. That little additional drag is felt by the man on the seat just as certainly as it is by the horse in the shafts.

The union not only regulated wages and working hours, but improved the class of men employed. We of the Delivery Wagons' Union are under bonds, and on account of the responsibility attached to the work we exercise care in admitting men to our organization. We frequently have the collection of C. O. D. bills, so it is to our own interest to have honest and reliable men. One man going wrong brings the whole organization into disrepute. I can see trouble ahead in getting back to our former standard when the strike ends.

Negroes Guarding Teams

Victim of an "Acid Egg"

Now, about this strike. The teamsters of Chicago are subdivided into over fifty different unions. Each branch of the work has its separate organization. There are over 35,000 teamsters enrolled, and at the height of the trouble something less than 10,000 drivers, helpers and boys became involved. If less than one-third of our number have been able to kick up all the fuss we are charged with, it is interesting to conjecture what might have been done if the entire number had taken an active part.

The strike started to compel Montgomery Ward & Co. to arbitrate the causes leading up to the walk-out of their garment workers. The teamsters, being a powerful organization, voted to help the garment workers and to refuse either to haul from the boycotted firm or to deliver goods to them. That naturally led to including in the boycott houses that insisted on their drivers delivering to strike-bound houses. Drivers for coal dealers, express companies, department stores, lumber firms and many wholesale houses were from time to time added to the boycott list. Ward & Co. would not yield to the demand for arbitration of the garment workers' difficulty, claiming

that the workers left their employ voluntarily nearly a year ago and that the places left vacant had been filled at once and in a satisfactory manner. As the strike progressed the garment workers' grievance became rather lost sight of in the greater question of holding the teamsters' unions together.

Many things have occurred to hurt our side of the fight. I will not admit that all the things charged against us, directly, are true, but at the same time I must admit that many, many things can have no defense. When the Employers' Association formed a teaming company and offered to put their men to work in the places of the strikers they brought to Chicago for that purpose a lot of non-union drivers, some of them pretty tough customers. The new drivers for coal teams were mostly negroes from Southern cities, and they had nerve to stay on their wagons in spite of persuasion to give up. Then some of the overzealous union drivers, assisted by sympathizers, who regarded force a better argument than mere words, undertook to dispose of these strike-breakers. Every union driver conceived it to be his privilege, if not duty, to block the way of the

"scabs." One thing led to another until stones and bricks were freely thrown at the imported drivers. The officers of one of the local unions took part in the forcible style of argument, and their arrest followed.

It was charged in the hearing before the grand jury that a gang of fighters, known as an "Educational Committee," was employed to "do" certain drivers. A man would be spotted and when the chance came he would be attacked by the "Educational Committee." In some instances he would not recover from the beating, and in other cases he would be crippled for life. That sort of thing, of course, instead of doing our cause any good injured us with the public and caused discontent in our own ranks. Many of us are bitterly opposed to any such methods.

It got so that a man really carried his life in his hands when he started out to drive a team for a boycotted firm, if he happened to come in contact with a crowd of these "educators" without being amply protected by a police guard.

When the strike extended to the lumber drivers there was all sorts of trouble over in the West Side lumber district. A large number of the union drivers are Poles—Polaks, they are commonly called—and they live in small houses in the vicinity. Their women are big and strong. It is no unusual sight to see one of these women carrying, with apparently little effort, a load of firewood or huge sack of coal that would stagger an ordinary man. They know but little English, but constantly are chattering in the strange lingo of their native land. When their husbands and sons left their jobs and a new set took their places those women at once took a hand in the effort to drive away the men they regarded as interlopers. They knew little if anything about any conflict between the unions and employers. All that any one of them could understand was that a stranger sat on the lumber wagon that "belongs to my man." That was not to be tolerated for a moment. Armed with heavy clubs they charged on the non-union drivers, and unless the police guard was strong enough to cope with infuriated amazons it went pretty hard with the drivers if

the women got within reach of them with their clubs.

In all the riotous scenes attending the strike there was nothing done even to approach the fierceness of the attacks by these women. The police would charge upon them with drawn clubs, but hesitated when it came to rapping them over the head as they would have done in the case of dispersing a mob of men. The officers would content themselves with laying vigorous licks on the well-developed part of the muscular women's anatomy presenting the most promising target, without accomplishing much more than drawing the "fire" of the attacking party to themselves. Many a time drivers, policemen and bystanders would be compelled to flee pellmell before a mob of these women, flourishing clubs of enormous size.

A favorite way to oppose the strike-breakers at the lumber yards was to set fire to their loads. A can of oil poured over the rear of the load and a lighted match did the work. In spite of the vigilance of the guards, the loads frequently would be set on fire, and, of course, the sight of a load of burning lumber soon attracted a big crowd.

The attacks next hardest to handle by the police were those engaged in by school children. These young sympathizers soon picked up the spirit of lawlessness. At the public schools when a non-union driver brought a load of coal for the building the children, only too pleased to have a chance to yell and get into mischief, hooted at the drivers, finally going to the extent of throwing stones at them. It was only by the aid of parents that the police at last were able to put a stop to these outbreaks.

But far the greatest blow our cause received was the discovery that some of our leaders were engaged in the most disreputable mode of life. They spent nights in low resorts and spent money freely in entertaining women of the vilest character. On top of all this it was openly charged that some of these officers had been receiving money from certain employers, either for the purpose of calling a strike or to settle one. The only offset to these damaging stories lay in the fact that the paying employers were equally to blame.

As already stated, many of us are opposed to violence and to the destruction of property. I, for one, think the cause of unionism has received a blow that will take some time to recover from. These lawless acts were practiced by a bad element in our own ranks, I am sorry to say, but were largely participated in by a lot of hoodlums, who took advantage of conditions to defy the law. Teamsters are not all angels, any more

were thrown at horses at times, but it couldn't have been done by teamsters.

It has been said that driving a team is not a trade and that teamsters should not be classed as trade unionists. It may not be a trade in the sense that, say, carpenter work or printing is, but still a good teamster must possess certain qualifications that every ordinary "laborer" does not possess. In our union a member must serve three years

An Arrest

than are all men engaged in other lines of work, but in our ranks we have some good law-abiding citizens, who will compare favorably with the best. We have been charged with things of which I feel sure none of us have been guilty. For instance, we have been charged with throwing acid on horses driven by non-union drivers. I would not be afraid to wager my life that no teamster worthy the name ever did such a dastardly thing. Why, we fairly love horses, and I know if anybody attempted to hurt my horses I would be down off my wagon in a jiffy with my coat off ready to fight. I cannot deny that acid "eggs"

before he can receive the highest wages of the scale. He must read and write and know the city thoroughly. He must know what to do in an emergency if anything happens to his horse or wagon. His horse may pick up a nail, take sick, go lame, or show distress from any cause. If the driver is capable he knows what to do for the time being. If the harness break or the wagon meet with an accident, he must be able to patch up the one and make shift with the other.

I heard of a non-union driver, during the early days of the strike, who broke a shaft by running into something way

out on the southside. When a crowd gathered around and laughed at his mishap, he seemed to be perfectly helpless. He simply took to his heels and left his wagon on the hands of his police guard. The officer had to tie up the shaft with a strap, take the outfit to a neighboring livery stable and telephone for another driver. I also heard that the darky driver had collected \$40 on a C. O. D. before the accident.

I refer to this incident to indicate the

difference between trained and trusty drivers and pick-ups.

From present indications the strike soon will be over. I am both sorry and glad—sorry that it was so badly managed, but glad that we will have the chance to get work again at living wages. I am quite sick of living on the “benefit.”

Some of us, most likely, will not get our old jobs back in a hurry, but then—well, we'll have to make the best of it.

CHICAGO, ILL.

An Anglo-American Navy*

BY PAUL MORTON

SECRETARY OF THE NAVY

THE Right Honorable Sir Charles W.

Dilke in a recent article declares the real meaning of the remarkable changes in Great Britain's naval policy to be that the present British Government is frankly and profoundly convinced that Great Britain will never again wage war with

the United States. This feeling is shared by most Americans. A few prominent men of the United States have expressed their disapproval of a large American Navy by stating that it is unnecessary, extravagant and altogether undesirable; that by a policy of non-exportation of food products this country could force Great Britain and the other Powers of Europe to sue for peace in thirty days' time, because the people of those countries are our best customers and absolutely depend upon the United States for their food supply.

To me this seems absurd, and, in my opinion, it will not be long before the

PAUL MORTON

growth and development of industry in this country will make it almost impossible for us to furnish any considerable quantity of breadstuffs to foreign countries. Within the next twenty-five years we are quite likely to consume all we produce. In the meantime other sources of food supply in the world will have

been so developed as to furnish substitutes for the present American exports; especially will Northwest British America come to the front as a wheat raising country.

To my mind the fact that Great Britain is our best customer makes it most important that we should have a navy which in case of dire necessity might be used to protect mutual interests. The policy of non-exportation advocated by some of our distinguished citizens would be as detrimental to us as to those we undertook to punish, and in case Great Britain should become involved in war with any foreign Power it might be vital for this country to keep open the avenues of trade, and to do this it would be neces-

sary to call in the agency of an all-powerful American Navy. The sentiment of the American people is now quite generally in favor of having a navy second only to that of Great Britain, and the almost unanimous feeling in this country is that the English speaking people of the world together should have a combination navy that could hold its own against all the navies of other nations. The American Navy combined with that of Great Britain would be an absolute power in the world's affairs.

All serious differences which the United States may have hereafter with foreign countries will be settled either by arbitration or by battleships. Most great modern wars have been settled by navies. Even in the Civil War in America the blockading of the Southern ports by the Union Navy, which prevented the people of the South from exchanging their cotton and other products for munitions of war, was an important factor in giving the North its final victory. More and more it is demonstrated by the Spanish-American War and the war between Japan and Russia that the Power which controls the sea measures the Power which will control the earth.

The American people are for peace. They think their greatest conquests are to be made in commerce. They deplore war. Their resources are great. They already furnish a large proportion of the surplus food to the world. However, they are not satisfied that their country should be considered only as the granary of the world. They want it to be regarded as the world's workshop, also. The wonderful resources of America, the ingenuity of the American people, their business instincts, their ability to work hard, all tend to make them ambitious to become the manufacturing people of the world, and with this in view they hope to do a share of the world's commerce commensurate with their wealth and resources. Neither will they be satisfied with making America the granary and the workshop, for the American people have ambitions along financial lines. It will not be many years before New York City has a population of ten million people, and the ambition of its financiers is to make it the counting-house of the world's commerce.

Personally, I am an "intense" American, but I believe in expansion. When I say expansion I do not necessarily mean an expansion of territory. I mean the internal expansion that is now going on in the United States. I believe in the expansion of our navy, of our political influence, and the reason for all this is that these things lead to expansion in commerce and finance.

The American people feel their taxes probably less than any other nation. They are already the richest people in the world and rapidly growing wealthier. The money is not being concentrated in New York or any single financial center, but it is generally distributed throughout the country. The agricultural classes never owned as much or owed as little as they do to-day. In brief, the American people as a nation are in a position to pay for anything they want, easily and without adding perceptibly to their burdens. This is shown not only in the annual appropriations and the building of the navy, but in the building of such enterprises as the Panama Canal, the devotion of \$25,000,000 to irrigation, and other stupendous undertakings which have been brought about without a perceptible increase in the per capita burden of taxation.

It is not necessary for us to have a navy as large as that of England, but I stand emphatically for a navy second only to that of England. I believe in a navy of such fighting force that it will discourage any other nation from desire to engage the United States in warfare. I believe in a navy so formidable that it will preserve peace; a navy so well prepared for war at all times that war will never come. My conception of the American Navy can be stated in three words—construction, instruction and destruction. I believe we should build as good ships as anybody. I believe they should be first-class in every particular. I believe they should be as well armored and their guns should be as large and that each ship should have as many guns as the best battleship of any other nation.

I know that our officers are just as gallant, just as brave, just as skilled as the officers of any other navy. I believe that our officers are the best educated

men of their class in the world. I know that our enlisted men are now nearly all American born. I know that they are the best clothed, the best sheltered, the best fed and the best paid men of any navy in the world, and I believe if war ever comes, which God forbid, when fight we must, our officers and our men will fight as well as, if not better than, the men of any other navy.

The navies of Great Britain, of Germany and of France are supplemented by a large merchant marine, which up to the present time we are without. I believe in the upbuilding of our merchant marine. I believe that exporting as we do more goods in tonnage than any other nation of the earth, we should own and operate more ships. Our greatest weakness in transportation is on the seas. We must devise some way to show the world that we can triumph in the carriage of freight by water in the same manner as we have on land.

The United States will in time logically and inevitably become the most powerful nation in the world. This will be due to geographical position and extent of country, diversified resources, enormous natural wealth, the composite and alert character of the population and also to the fact that the tax resisting power of the American people has as

yet been encroached upon to but slight degree and promises in the future to become almost inexhaustible. The fulfillment of such a destiny as this will be advanced or retarded in direct ratio to the expansion of the naval power of the country.

England is now the greatest naval Power in the world and probably will remain so for many years to come. Her people are so accustomed to regard naval expenditure as a necessity that no complaint is made of taxation for the purpose of maintaining a supreme position. The United States is the only country which has or can secure the money in the immediate future required to build up a naval Power approximating that of England.

With the navies of the two countries large enough when combined to constitute an unquestioned authority in the affairs of the world, it would not only be a matter of sympathy between English speaking peoples or self interest in the maintenance of international markets to prevent war, but there would be a possible moral obligation resting in the possession of this power, which would be as compelling in bringing about united action for peace throughout the world as any need for self protection.

WASHINGTON, D. C.

Liberty Bell

BY IVAN SWIFT

Ah, here is our Liberty Bell,
 Paraded in pride of old!
 I would that my tongue could dwell
 In the turbulent times she tolled.
 I would it were mine to reveal,
 In a reverent rage of song,
 The secrets her sibyls conceal
 And the motley and militant throng.
 Forgetful of things that be,
 I turn to the long-ago—
 To the years ere men were free
 And the world moved on but slow;
 To the days of ruffle and wig
 And leathern-apron and hose;
 Of flint-lock, horn and brig,
 And the spirit that went with those.

My mind is peopled of courts
 And powder and silk and sword;
 The hound and the falcon sports,
 And pride of lady and lord.
 I witness the hurrying groups
 To the hall of the prophet's light,
 And the red and the rags of troops
 In the dim-lit streets of night.
 But thou, old Liberty Bell,
 Attuned to the patriot shout,
 Didst ring for a tyrant's knell,
 And ring till Freedom was out!
 Now loud shall Liberty sing
 Te Deums around her shrine—
 And nations bent shall bring
 Their altars unto thine!

PHILADELPHIA.

The Americanization of Paris

BY ALEXANDER HUME FORD

[Mr. Ford is a newspaper man who has traveled pretty much everywhere in quest of news. He has written a good deal about Manchuria and the Far East.—EDITOR.]

LONDON, once the headquarters of Americans abroad, has yielded place to Paris. The keen-eyed, cautious Yankee merchant has taken a hand at fleecing his fellow countrymen in foreign lands, and Paris, a day nearer all Europe than "dear old Lunnion," is becoming the home of our foreign branch houses, while the newly established Mediterranean steamship lines divert an enormous traffic from ever reaching England, so that as the Americanization of London ebbs the Americanization of Paris becomes a fact accomplished.

The grand boulevards are as typically American to-day as is upper Broadway. The great fashion bazars are largely American, as are all the gorgeous shoe emporiums. Even the Latin Quarter has succumbed, and Macmonnies' Bacchante, rejected by Boston, occupies the place of honor in the Jardin de Luxembourg. Upon the outer boulevards the cakewalk has superseded the cancan, and the once naughty Moulin Rouge has become the home of harmless American musical comedy, while at the Grand Opera House, from which radiates all Paris, Jane Noriah, an American singer, is the favored prima donna, who reigns supreme over the hearts of Frenchmen and Americans alike.

A day in the life of a twentieth century Frenchman in Paris is but the diary of successive American conquests that begin when he is awakened in the morning by a Connecticut alarm clock and ends with his retirement at night to his Yankee folding bed, the adoption of which has introduced to Parisian life the modern "Harlem" flat. The once gay Parisian has also become acquainted with the American full length bathtub, and it is said that he is really learning to enjoy our breakfast foods, the energetic compounds of which delight to disfigure his walls with their original advertising. Over his "breakfast food" and coffee he

reads a paper printed on an American press, looks at his Yankee dollar watch and hurries out to catch the American motor car that takes him to his office, where he sits all day at a desk made in Cincinnati, dictates letters to a stenographer educated in the only school of typewriting in Paris, an American one, and signs his name to her work with a fountain pen from New Haven. When he goes home to dinner it is to find that American chilled beef has invaded that sacred precinct, and, owing to the unprecedented failure of the fruit crop of France, luscious pears from California are served as dessert, while even his wine is blended with fiery American claret to give it that biting taste calculated to reach the jaded palate of a Frenchman. Should he attend the theater of an evening there is "The Belle of New York" in French at the reformed Moulin Rouge, or should he be sick after his American wine there are American doctors a plenty in Paris, and American remedies are the fad. A solitary American candy store exists where the gay Parisian may treat an after-theater party to ice cream soda and home-made molasses candy, while the largest business signs in all Paris are those of the far-famed "Dentaire Americain." Well or ill, the Parisian of to-day is dependent on American aid, and at his death, if he be a prudent man, insured in any one of the three largest life companies in France, his widow will receive a dowry from American pockets.

To the American life insurance companies belongs the credit of paving the way for a welcome to all kinds of Yankee enterprise in Paris. A New York company, after moving its head European house from London to Paris, rapidly built up a Continental business that now amounts to one franc for every dollar the home company has underwritten in America. Two other American life insurance com-

panies followed the example of the New York pioneer and began investing their surplus in Paris real estate, which they are now beginning to improve. The life insurance building on the Boulevard des Italiens is externally the most beautiful business structure in Paris, while internally it is the most sumptuous office building in the world. A dozen electric elevators carry visitors to the various offices, where over three hundred young Frenchmen are being trained in the Yankee methods of doing business, and here the Americanizing of Paris may be studied comprehensively.

The "spread eagle" citizen of our glorious Republic will be somewhat shocked to learn, perhaps, that the life insurance companies pursue a conservative policy that permits them to adopt many French customs which they assimilated in the Americanizing process.

The Frenchman is seldom punctual, but he is saving of everything but time.

A law was laid down by the superintendent of the Yankee insurance company that any clerk or workman reporting for work after the regular hour would be discharged, and there was a bitter protest from the French employees, several of whom were prompt to lose their positions. Next an ironclad rule was made that not a scrap of paper was to be wasted or misused, and the cry that went up from the American clerks could be heard even beyond the pale of foreign settlement in Paris.

Then the system of one foreman to each three workmen was broken up, and every Frenchman not willing to be individually responsible for his work was discharged. It went hard with men who had never worked save under the eye of a sub-master; but with the dead wood chopped away the American managers could afford to put in operation another imported idea. It was announced that every employee must thereafter accom-

An American Life Insurance Building Decorated by France and Relieved from Taxes Because It Is the Most Perfect Modern Office Building in Europe

The American Head of a Yankee Insurance Company in Paris in His Office, the Most Luxurious in the World, Fitted Out with American Furniture and Fixtures. This picture was taken a few days before he received the Cross of the Legion of Honor in recognition of his services to France as a reformer of business methods and the instigator of the Saturday half holiday for French workmen. The flashlight was made by the leading photographer of Paris, an American who uses American cameras

plish a full week's work in five and one half days, as it was the intention of the company to close its offices every Saturday at noon. At present this plan is not only working well, but is spreading from the American firms in Paris to those purely French. The process of amalgamating French thrift with American rush is noticed the moment one enters the model office building of Paris. No starter stands before the elevators, nor is there any one within to pull the rope and carry the passenger to his floor. Instead the visitor enters alone, the doors close after him automatically, and as he seats himself the car ascends. A touch on the numbered buttons before him will cause his car to stop at the floor indicated, where the doors open and the electric current is turned off; not a volt wasted, no needless employee to pay, yet the man of business is carried swiftly and safely to the offices of the company and a practical demonstration given of how the

American in Paris combines the thriftiness of the French with the enterprise of the Yankee, to his own profit and the comfort of all concerned.

Even in habits of living the American in Paris is apt to adapt himself in part to the ways of the Frenchman. I once asked for a drink of water in the great American office building. The Vice-President of the company stood aghast, while another of the head officials personally superintended the search for a glass of drinking water. It was not to be had, yet three hundred French and American employees lunched daily in a large room in the basement; but they one and all drank wine, and so did the officers of the company. In fact it is the proud boast of an American express company near the Opera House that it alone possesses the one solitary ice cooler in all Paris. This seems hard to believe, but certain it is that Russian visitors who drop in with their American friends in-

An American Candy Store

variably turn the cock and rinse their hands *à la Russe*, for in Slavonic lands water cans, exactly resembling our coolers, are found at every railway station and are used only for purposes of ablution. Even in the everyday matter of footwear a compromise has been made. The French prefer the perfect fitting elastic American machine-made shoe, but they cannot reconcile their ideas of thrift with the purchase of shoes made in America with soles of chemically tanned leather not three months off the cattle. These soles are delightfully pliable, but they wear out before the uppers, whereas the French soles, seasoned for years, seem to last for all time, and so it is that the French village of workers making shoes by Yankee machinery utilize home-tanned leather for soles, with the consequent result that both Frenchmen and Americans in Paris prefer them, in spite of their inevitable stiffness, to the imported article. The subject is often discussed in Paris, and the only consolation the average American can usually extract from the argument is that, after all, the best French shoes, even if made in France, are put together by American machinery.

Even the American daily papers published in Paris have become Latinized, while the great Paris journals have shown quite an Americanlike desire to swallow their smaller rivals and become puffed up. The French newspapers, however, still seem primitive when viewed from across the Atlantic. Altho they seek to approach our methods their

attempts are more ludicrous than effective.

It is the fashion nowadays for French editors to send their copy to be set up by the American company operating the linotype machines. Here the publisher calls for the forms or has them run off in the same establishment, and merely receives the papers for distribution. Passing in the neighborhood of the Bourse one afternoon and hearing the click, click, click of the American typesetting machine at work nearby, I dropped into the building whence the sounds proceeded, only to fall upon as unique a situation as it has been my lot to encounter in any foreign land. At a score of American linotype machines sat as many French girls, typewriting away for dear life, molding the news of Paris in Yankee forms. I had stumbled upon the composing room of half the daily papers of Paris. Here the widely divergent views of *Le Gaulois* and the *Radical* were being set up side by side by two French girls, who should they carelessly accept a wrong slip of copy might set Paris by the ears. Imagine the eight leading morning newspapers of New York using one common composing room, with the possibility of a lurid murder sensation prepared for a saffron journal in the rush and confusion of the small hours finding its way into the columns of some demure family journal that prides itself on setting forth only "the news that's fit to print," and you have the dramatic possibilities that the Americanization of the Paris press may

bring forth of a fine morning in the gay French capital.

Even at night American ideas are sometimes a disturbing element in Paris. From time immemorial it has been the custom of the French storekeeper to shut up shop at night and enjoy himself elsewhere. One evening an American phonograph company startled the Boulevard des Italiens with a display of electric lights that was little short of prodigal. It was spread eagle run riot. Every window from garret to basement was a blaze of electricity. Gendarmes had to force passages through the crowds that all but mobbed the parlors to get within and help to swell with their two sou pieces—in the slot—the receipts of the keen Yankees that week after week amounted to \$500 a day. Other American concerns, however, soon took to the same form of advertising, forcing the thrifty French to fall into line, until now the boulevard of an evening resembles noth-

ing so much as the Rialto of Broadway on a gala night, and the electric light signs have lost their attractiveness to the surging Paris mobs.

It is of interest to note that the phonograph, which brought about the modern methods of street window lighting now in vogue in Paris, is an invention claimed by both France and America. Furthermore, it was French money, the Volta prize of \$10,000 awarded to Prof. Alex. Graham Bell for his invention of the telephone, that was used to perfect the phonograph. The American inventor little dreamed that the speaking machine would revolutionize evening traffic on the boulevards of Paris long before it fulfilled its intended mission of revolutionizing the world's methods of business correspondence.

Not only in the lighting of the streets have Yankee ideas in the use of electricity been utilized in Paris. The Thomson-Houston installations were the first to provide power to operate electric cars in the French capital. Yankee motors are still in the lead in the streets of Paris, and when our American Consul recently purchased what he believed to be the most perfect model of the French automobile obtainable it was only to discover that the "guaranteed perfect" electric storage battery and machinery was an importation entire from America. So that, first and last, we seem to find favor

The American Trolley in the Streets of Paris

Boulevard des Italiennes. Near the Opera House. An American phonograph company has revolutionized street window lighting in Paris. Next door is a Yankee typewriter concern where hundreds of Paris clerks have been taught stenography. American stores predominate in this district

in the eyes of the French as their superiors in the construction of electrical equipment of every kind, and they, instead of becoming jealous, merely insist upon our making up their deficiencies, even if we have to build factories about Paris to supply the French demand for our high grade machinery.

Much might also be said about the influence of American architecture on the rebuilding of Paris—hotels that, patterned after our famous Fifth avenue hostleries, rival the originals; office buildings and apartment houses duplicating our own familiar structures, and private residences, such as the Castellane marble palace, that was brought piecemeal from the quarries of these United States to be

placed on the Champs Elysées. But a few closing remarks concerning our complete commercial conquest of the heart of Paris will suffice to demonstrate the possibilities of American enterprise and investment in recreating the Paris of the future, where business will perhaps some day be placed at least on an equal footing with pleasure.

As mariners box the compass, so Americans study Paris by first learning to box the Opera House. To the north is the Boulevard Haussmann, that graveyard of American banks; northeast by north is Rue Gluck, where our fashionable tailors locate their Paris branches; northeast is a view of the Rue Lafayette, where the American shoe machinery trust

holds forth, while due east is Rue Meyerbeer, with its great gold sign of an American dental parlor running across a building fully a block in length. Southeast by east, on Rue Halevy, is the Paris home of an American life association, while southeast by south, at the corner of the Boulevard des Capucines, is the spread eagle sign of a Chicago daily paper that occupies the old quarters of *La Press*, from which editor Boulanger made his escape from a Paris mob that thronged the Place de l'Opéra and wished to make him Emperor. The magnificent buildings surrounding the Place de l'Opéra and facing the Opera House are all either owned by American firms or occupied in part or whole by distinctively American agencies. Next to the Chicago *Daily News* offices are the various typewriter and phonograph exhibitions. A branch of the New York Life Insurance Company occupies the building between the Boulevard des Capucines and the Rue du Quatre Septembre. A French bank owns the building at the corner of the Avenue de l'Opéra, but it leases out

a part to a company that supplies France with 2,000,000 tons of American coal annually. Adjoining is the block occupied by the European headquarters of the Equitable Life Insurance Company, Tiffany's Paris store, the American Consul and a number of Yankee firms, while across the avenue is the leading book store of Paris, Brentano's branch of his New York establishment; the *Herald's* Paris edition building and Cook's Tourist offices at the corner of Rue de la Paix. This and the Grand Hotel across the way on the Boulevard des Capucines, with only the block recently purchased by the Equitable Life Company between, are the chief Paris headquarters for most American travelers abroad. The American bar of the Grand Hotel is just southwest of the Opera House, while due west is Rue Auber, where American opticians now teach the French how to perfect spectacles and opera glasses. Northwest by west is the extensive building of the American Express Company, once burglarized by American burglars with American tools that excited the wonder

One of a Number of American Shoe Stores in the Grand Boulevard of Paris

and admiration of the Paris police; and so the center of Paris, the wonderful Opera House, is boxed by the American, and could the superb voice of the Yankee prima donna who sings within penetrate the massive marble walls it would fall

upon more American than French ears in this Yankee quarter in the heart of Paris, for the Americanization of the gay French capital has begun here and extends everywhere.

NEW YORK CITY.

Shintoism in America

BY IDA HUSTED HARPER

[Mrs. Harper represented the United States as delegate and speaker at the International Council of Women in London in 1899, and again at Berlin in 1904, and is fully conversant with matters pertaining to organizations of women. In our editorial columns we have something further to say on this kind of Shintoism.—EDITOR.]

JUST now, when everything connected with Japan possesses an unusual interest, we are led to inquire what is the leading force that has produced this remarkable race, and we are told that it is Shintoism, the national religion, the supreme doctrine of patriotism. Heretofore, when things Japanese have had only our superficial attention, we have rather contemptuously referred to this religion as "ancestor worship," but now that we are looking deeper we find that what it really signifies is "worship of the *way* of divine ancestry." As President David Starr Jordan felicitously expresses it: "The spirit of living so that ancestors will not be ashamed of their descendants." There is all the difference in the world between these two interpretations.

What is the status of American Shintoism? It must be admitted that in the worship of either our divine ancestry or their divine ways we have been decidedly lax. Nothing existed which possibly could have been considered as an "official" recognition until a few years ago, when an organization was formed of the "Sons" of ancestors who fought in the War of the Revolution. This, however, was a mere cult which did not approach the dimensions of a "national religion" until reinforced by the founding of the Daughters of the American Revolution. As all of our other religions are kept alive by the efforts of women, it is natural that this one should prove no exception. It came into being in 1890 under

most favorable auspices, not opposed and ridiculed by men, as so many associations of women had been, but by the urgent wish and effort of the Sons of the American Revolution. Its announced object, "To perpetuate the memory of the spirit of the men and women who achieved American Independence," antagonized nothing and nobody. No newspaper would dare in ribald fashion to criticise a society organized for such a purpose—it would be like casting contumely upon the American Eagle. Men in general were rather glad to have women relieve them of an obvious duty which they had sadly neglected and would likely continue to neglect. Here was a field in which the Southern women could work with the Northern to the glorification of a common ancestry. Here was a grand opportunity to exploit one's ancestors, a desire which is strong in the average woman. The early prejudice against women's organizations had been conquered, but many women still held aloof because the objects of those already existing—to improve the mind or reform something—did not appeal to them in the slightest. The devotees of the church had found some outlet for their activities in missionary societies, which encountered no opposition so long as they were only an "annex" and turned over their funds to the men's societies. But there yet remained a large class of women thoroughly imbued with the modern club spirit, but not interested in saving the heathen or willing to enter any

organization which savored of the "strong-minded," either in literary effort or the consideration of vital questions.

To all of these the Society of the Daughters of the American Revolution presented the open door, and through it they poured in companies, battalions, regiments. When the wife of a President of the United States consented to stand at its head its social status was fixed and the rush to get in became greater. Society leaders in various parts of the country began to organize chapters, and women who were not in "society" saw here an opportunity to stand on the ragged edge at least. The adoption of high-sounding official titles—president-general, vice-presidents-general, and so on through the list of thirty officers—the declaration that only women of the best social position should fill these offices, and the establishment of a little aristocracy in Washington, known as the "National Board," completed the magnificent structure; and the increasing haste of women to get within reminded one of the crowds around a circus tent when the band inside begins to play and the roar of lions and trumpeting of elephants are heard through the canvas. Shintoism was fashionable.

The contemplation of all this fills us with amusement, contempt or anger, according to our temperament; but admiration begins when we examine the really excellent work these women have done in carrying out the objects of their society, the long neglected historic places which they have marked with tablets and monuments, the ancient buildings they have secured, restored and preserved from destruction, the records they have hunted up and made permanent, the celebrations of Revolutionary anniversaries they have established, their valuable services in the Spanish American War, the spirit of patriotism and the love of the flag they have put into action.

But in a little while the societies west of the Alleghenies who had no "historic spots" began to grow restive. They had nothing concrete to expend their energies on, and it is hard to keep up enthusiasm over abstractions. Then came like an inspiration the idea of Continental Hall, a great building with an audi-

torium, a museum for Revolutionary relics, a library for historical works, the offices of the national organization, etc. On this proposition the chapters all agreed—almost the only instance—and for the past thirteen years there has been a most heroic effort to build this hall. Many who during these years have been exasperated and humiliated to the extreme by various discreditable performances have frequently said: "Everything shall be forgiven if they will complete this hall, that it may stand forever as an achievement of woman."

To one who is familiar with the many organizations of women and the splendid things they have accomplished the proud assumption of superiority on the part of this one seems inexcusable, but this is partly because it knows only its own work and therefore cannot have any just sense of its proportion. When its members were bringing every possible influence to bear on Congress to secure one of the Government reservations in Washington as a site for Continental Hall and I was appealed to by a vice-president-general I asked, "Are you willing that the Woman's Relief Corps or any other patriotic organization should also have a reservation here for a hall?"

"No," was the answer, "the case is entirely different with us."

At another time one of the National Board says to me: "It seems as if our chapters are almost drained dry for Continental Hall and we have been thinking of calling on other organizations of women to help us out. What do you think of the plan?"

"Well," I said, "there isn't a suitable place in Washington for a woman's convention and yet the Council of Women, the W. C. T. U., the Suffragists and many others like to hold their meetings here. They might be glad to contribute if they could have their conventions in the hall, even if they had to rent it."

"We wouldn't think of such a thing," was the hasty answer.

The ground was finally bought for \$55,000, a beautiful location facing The Mall; about \$5,000 was spent on architects and \$1,000 on incidentals; nearly \$29,000 on a foundation and not quite \$75,000 on the building. It was suffi-

ciently inclosed to permit the holding of the Congress there last April, but it must be confessed that the auditorium in size and arrangement was a decided disappointment. The outside of the structure promises to be very handsome, and it is expected that the hall when completed will cost \$500,000. Of this amount, in thirteen years of most strenuous effort, \$215,000 has been raised. The Congress voted not to put a mortgage on the building, so it is difficult to see how it is to be finished unless somebody with a great deal of money, "tainted" or otherwise, comes to the rescue. But here, again, one must admire the pluck and energy of these women, for every one of the 140 members of this committee has worked as hard for this hall as if she were making a home for herself, while the "Daughters" in all parts of the country have brought in every dollar they could earn or beg or acquire in any manner.

One must admire also the wonderfully businesslike way in which the affairs of the organization are conducted at the large headquarters in Washington; and yet, when one considers that all of the officers contribute their services, one questions whether there may not be some extravagance to bring the actual office expenses up to nearly \$18,000 a year and other expenses connected with the society to a total of more than \$38,000.

It is, however, when one who approves of genuine Shintoism views the annual Congress of the D. A. R. that she is reduced to actual despair. Year after year many of us attending as delegates have hoped for better things, only to be disappointed, and the last was no improvement on its thirteen predecessors. When one sees in the mind's eye the grand, old snowy crowned head of Elizabeth Cady Stanton and the strong, noble face of Susan B. Anthony, and recalls their years of struggle and martyrdom to secure for women the right to hold public meetings and speak from the platform, and then beholds in this Congress to what this right has degenerated, it is heartbreaking. If the body were composed of ignorant women who had had none of life's advantages there might be some excuse, but, on the contrary, its members are educated, traveled, well-

gowned, socially prominent, high in church standing—the picked women, so to speak; and yet they make of this Congress a by-word and a reproach, a performance which the public goes to see as it would a vaudeville show at the theater. If it ended here it might be endured, but it compels the whole cause of woman to be held in contempt. It is in vain one calls attention to all other conventions of women—the great International Councils, the Suffragists, the W. C. T. U., the Federation of Clubs—as orderly and dignified as the United States Senate. Nobody will listen, nobody will remember; they only point to this Congress and say, "Behold the unfitness of woman for public life!" People lose sight entirely of the excellent work the organization really has done and is doing, and see only this undisciplined and irresponsible body of delegates, the great majority selected merely because of their ability to pay their own expenses.

This is the first organization of women that ever had a backing of men. It is the first and only one that ever was used as a political machine, if we except the W. C. T. U., which was for a while a prop for the Prohibition Party. From the beginning it has been directed by men; it is so still, and the hand of Esau may be detected in most of the acts which have brought it into disrepute. There is much encouragement in the fact that a large portion of the 42,000 members resent this condition, and, altho they have been powerless to prevent it, they would not be driven out of the society. Women on the floor of the Congress again and again have shown themselves fine parliamentarians, able debaters, fearless and honest, but they have had about as much chance as a sound-money, protective-tariff Democrat in recent campaigns. The last election of officers represented a revolt. In the language of politics it was the triumph of democracy over aristocracy, of the masses over the classes. It was the answer of forty more than half of the delegates to the dictum of the governing powers that no woman ever should be elected president whose husband did not hold a high official position, that none should ever be taken from the floor of the house. The elec-

tion expressed the spirit of fair play, of a square deal, in a majority of the delegates.

Hope springs eternal, and this society is worth keeping alive. There is good fighting stock in it, but it is undisciplined and some courts-martial are needed. After all the "historic spots" are marked and everybody has a monument and Continental Hall is finished there will still be many vital matters needing attention toward which these trained combatants can direct their energies, and this they will have to do or perish in an ignoble contest over small things.

It will not be absolutely necessary for this society to continue in order to keep patriotism alive, as there are a number of other patriotic organizations of women. Of these the Woman's Relief Corps alone has about 150,000 active members. It has instituted patriotic teaching and the salute to the flag in the public schools and made the observance of Flag Day general. The W. R. C. Home for army nurses and widows of veterans, built at a cost of \$200,000, is one of its memorials, and it maintains homes for veteran soldiers in several States. Without its financial assistance the Grand Army of the Republic could not exist. It spends annually about \$16,500 on Memorial Day for the decoration of soldiers' graves. During the past twenty-two years it has raised and expended in relief work nearly \$3,000,000.

There are also the Ladies of the Grand Army of the Republic, about 30,000 of them, who have expended many thousands of dollars in humane and charitable work for the veterans of the Civil

War and their families, and who labor earnestly to perpetuate the memory of the heroic dead and teach patriotism to the rising generation. The National Alliance of the Daughters of Veterans continues this great work. The United Daughters of the Confederacy, with 500 branches and 25,000 members, perform these same high and holy duties throughout the Southern States. The Daughters of 1812 preserve the records of the brave soldiers of that struggle and have a care for the few survivors.

All of these can be safely trusted not to let practical patriotism die out in the United States, and yet, in addition to their noble work, there is a distinct place in our national existence for the specific functions of the Society of the D. A. R. which we have faith to believe they will yet prove themselves worthy and capable of sustaining with a dignity and singleness of purpose befitting so high an object. Aside from the material demands of patriotism there is a genuine need in American life for cultivating Shintoism—a worship of those "ways" of our ancestors which found "divine" expression in the creation of the first republic. Is it too much to hope that eventually this reverence for them will be shown, not in wearing a number of gold bars on a ribbon, not in covering the breast with decorations, not in playing small politics, but rather in imitating their freedom from self-seeking and posing, their discipline, self-sacrifice, strong sense of duty and scrupulous honor in affairs of State? "The spirit of so living that ancestors will not be ashamed of their descendants."

PORTLAND, ORE.

Shaw as Playwright and Philosopher

BY HERMAN SIMPSON

GEORGE BERNARD SHAW, in his utter contempt for all posing, conventional or Byronic, exhibits himself in all his varying moods. He has unmasked the great Julius and the mighty Napoleon, and shall he hide himself? No man, however, can show himself before the world in utter nakedness. A mask one *must* have. And so, by reaction, Mr. Shaw has chosen the comic mask. If others make it their business to conform to accepted standards, to be considered "men of common sense and good taste, meaning thereby men without originality and moral courage," he makes it his business to startle their common sense by his paradoxes and to shock their good taste by his audacities. In his prefaces, as well as in his plays, he luxuriates in grim irony, in sardonic humor, in the exuberance of his capricious wag-gery.

The plays in themselves are quite sufficiently puzzling and staggering to the average philistine, but Mr. Shaw insists on adding insult to injury, on warning his readers that they are all blockheads, that what he writes must of necessity "pass at a considerable height over their simple romantic heads," and thereupon proceeds to bare his heart to them with the same candor with which he had analyzed the work of others. He brazenly tells them that he is a charlatan, a natural born mountebank, a lover of the cart and trumpet, who writes his own prefaces because he can—not like those helpless fellows, the other playwrights, who must beg some critic to supply them with a preface or else forego it altogether. The results of this method of treating the public might have been foreseen. The worm turned. The public—or the articulate portion thereof, the professional literary and dramatic critics—refused to believe that they were stupid, but agreed that the plays were unintelligible, and pronounced on them the death sentence.

Such was the situation, satisfactory

alike to Mr. Shaw and his critics, until a little over a year ago, when a comparatively unknown actor, Mr. Arnold Daly, cast his bread upon the waters and suddenly sprang into fame with his production of "Candida." The professional critics rubbed their eyes in amazement at the enthusiasm of the audiences, considered the thing a mere fad, a passing whim of the New York populace, ever on the hunt for fresh excitement, and continued to speak of Mr. Shaw as an incorrigible Irishman, who persists in going out of the way of his art for the mere pleasure of swinging his shillalah over every chance head that passes. Mr. Daly repeated his triumph in the "Man of Destiny," "How He Lied to Her Husband" (in which Mr. Shaw travestied his own "Candida"), and in "You Never Can Tell." The critics have by this time begun to descend from their high pedestal of "art for art's sake," and now and then even condescend to cast a fastidious nod upon the work of this unaccountable man, tho they have not ceased to wonder how it has actually come about that he has achieved success and popular applause notwithstanding his systematic violation of their canons for attaining this *summum bonum*. Meanwhile, it is reported, the theatrical managers are vying with one another in the eager haste to acquire the stage rights for Mr. Shaw's plays. But for the continued powers of attraction of "You Never Can Tell" we should by this time have witnessed a stage representation of the superb audacity of John Tanner in "Man and Superman," and we doubt not that in due course of commercial events those disinterested guardians of public morality—the theater managers—will yet overcome their repugnance even to the shocking Mrs. Warren.

How are we to account for this remarkable success of plays that had been foredoomed to inevitable failure by the universal consensus of the critics? Simply in this way: that Mr. Shaw's plays,

like Napoleon's strategy and tactics, really do violate the regular rules, that they were not written with an eye to "pure art," that they treat of problems which have been forcing themselves with

or comic. No great poem, play or novel was ever written that did not have a serious purpose and meaning. But whereas the purpose has in course of time been superseded and the meaning forgotten,

GEORGE BERNARD SHAW.

His Latest and Favorite Photograph

ever increasing intensity upon popular attention, that they have a serious purpose underlying their comic form. In this respect, indeed, the plays diverge more from the fossilized rules of the critics than from the invariable practice of the great masters of literary art, tragic

while the work of art has continued to give pleasure, therefore, reasoned the critics, there never was any purpose or meaning other than that of furnishing pleasure.

In the course of the last half century Western society has undergone vast and

vital changes: The organization of industry has assumed new and complex forms; new States have been founded and international relations have assumed new aspects; the relations of the various social classes have undergone profound modifications; the sphere of woman's activity has been immeasurably extended, while the work done in the home has been correspondingly contracted; the responsibility of society for its poverty and its crime is coming to be ever more widely accepted; new sciences and philosophies have been created, while the questions that were uppermost in the minds of our grandfathers have been relegated to the background. On the Continent this has given birth to a new literature, to Zola, Tolstoy, Ibsen and their followers; we have had but one Kipling, whose great vogue was due to his imperialistic tendency. On the social side we have had no one until Mr. Shaw came with his plays. But, whereas the great Continental writers have met with a serious reception by a serious public, were admired or hated, extolled or censured; Mr. Shaw for a considerable time met only with supercilious banter or blank indifference.

The reception which he met is a fact of no inconsiderable importance in the artistic development of Mr. Shaw, in his choice of subjects as well as in his treatment of them. Since he wrote "Widowers' Houses," his first play, his art has without a doubt ripened, and his technical mastery is no longer open to question. It must also be admitted that from the very beginning there was present in him an element of aloofness from popular feeling, an intellectual epicureanism, if we may so call it, which revels in its own inexhaustible wit and fertility of resource. "The Philanderer," Mr. Shaw's second play in point of time, shows this characteristic to a remarkable degree. But neither can it be denied, we believe, that there has been an abnormal development of this characteristic in some of the subsequent plays and that this is greatly due to the indifference with which the earlier and more powerful plays have met both in England and in this country. If the critics now complain of Mr. Shaw's "bloodless erotics" and of his failure to "bite into the substance of life," they

have largely themselves to blame. "Mrs. Warren's Profession" has no bloodless erotics, nor erotics of any sort, and descends into the profound depths of life, yet who among the noted critics would venture to advocate its production or, if produced, would not condemn it as brutal, squalid and vulgar? But, of course, it is not beglamoured with a mendacious romanticism or enveloped in an atmosphere of lachrymose sentiment, as the "Camilles" and the "Zazas" are.

The plays that Mr. Arnold Daly has thus far produced do not, it seems to us, bite deep into the substance of life. Neither the conflict between the strait-laced Nonconformist father, with his ideas of the patriarchal age, and his self-assertive, pleasure-loving children, nor the conflict between Napoleon and the unknown lady for the possession of Josephine's letter to the Director Barras, nor even the conflict between the poetic lover, with his deep intuitions and practical extravagances, and the prosaic, self-satisfied husband, can be said to go to the heart of us and grip it with resistless force. Can any of these—excepting only the splendidly effective climax of "Candida," in which the wife asserts her worth and the husband pathetically admits it—can any of these be said to typify any of the prevailing tendencies of the age? What gives life to every one of these plays is not so much their subject matter as the manner of handling it, their masterly technique, their sprightly wit, the incessant flow and rapid transition of ideas. But the playgoing public will not know the best that Mr. Shaw has thus far done until it has had a chance to see his searching, his remorseless analysis of character and motive and his exhibition of the degradation of poverty's victims, of the callous rapaciousness of respectability, of the "duel of sex" raised to the highest power, in such plays as "Mrs. Warren's Profession" and "Man and Superman."

Mr. Shaw has also made two excursions into the field of the historical play, in the "Man of Destiny" and "Cæsar and Cleopatra;" for, of course, the slight sketch of General Burgoyne in the "Devil's Disciple" does not put that play into the historical category. Notwithstanding all our admiration for Mr.

Shaw's intellectual resources, it is our humble opinion that he has distinctly failed in his high purpose, which is no less than that of portraying great historical characters in accordance with our enlarged historical knowledge and conception. He has, it is true, succeeded in divesting the heroic character of the false romanticism with which the popular legend (often enough a purposely manufactured legend) disfigures it, and has shown us that the strength of great his-

(by the way, the *bon mot*: "Cæsar is not a Cæsarian," did not originate with Mr. Shaw) in spite of himself, but in obedience to the call of the army, the Roman populace and the provincials. If Mr. Shaw was to rehabilitate Cæsar, how could he do it except by this method? One may not like Shakespeare's Brutus, but Shakespeare's forum scenes bear the true generic stamp of tumultuous popular assemblies. Similarly, the "Man of Destiny" reveals to us none of the his-

Stage Setting from "You Never Can Tell," by George Bernard Shaw

toric personages lies in their strong sense of reality and in their disregard of the ordinary traditional views of right and wrong. Indeed, considering that the historical hero is the product and instrument of a revolutionary epoch, it is evident that his moral conceptions must be the very opposite of the traditional ones. But of the revolutionary epoch itself, and of the historical action of which the hero is no more than the central point, we get no inkling. We learn nothing of the forces that moved the Mediterranean world in the days of Julius Cæsar and compelled him to become a "Cæsarian"

torically active forces that made Napoleon's destiny. In explanation of his victories we are told—not, however, in the play itself—that Napoleon had a sharp eye for physical geography, and that the French soldier had a great liking for stolen silver spoons. But how much does this explain? The French revolutionary generals before Napoleon had more than once repelled the onslaughts of coalized Europe. And as to fondness for silver spoons, that was not a special characteristic of the French soldiers under Napoleon. Mr. Shaw himself has told us elsewhere, through Don Juan, that

"when the military man approaches the world locks up its spoons and packs off its womankind."

It is, indeed, possible that the comedy form does not allow of development of a true historical play, of which species of literature Schiller's "Wallenstein" is generally regarded as the highest achievement. History is essentially a great tragedy; every advance of mankind must be dearly paid for; vain, fruitless and premature efforts must be made as steps toward fulfillment, and fulfillment itself ever turns out to be a sad disappointment; for no sooner has one step upward been made than mankind begins to strain for the next climb, and every goal attained is but a starting point. In view of this inherent contradiction between the comedy form and the historical subject matter it is possible that Mr. Shaw has achieved all that might reasonably be expected of a historical comedy. But does not the choice itself of this inherently defective vehicle indicate an unhistorical type of mind? We are confirmed in this suspicion of ours by the

introduction in "Cæsar and Cleopatra" of a modern Englishman of the middle class, and even more so by Mr. Shaw's defense of this procedure, which amounts to this, that the customs and opinions of our own day are the law of history. Is not this a very close paraphrase of Britannus's own opinion that the laws and customs of his island and his tribe are the law of nature? Finally, our suspicion obtains the seal of certainty from a persual of John Tanner's "revolutionary handbook," in which there is little that would indicate any knowledge of the results of modern historical and ethnological research, much less any just idea of historical forces and processes. And this notwithstanding the fact that our modern Don Juan has indulged in no more than "two immature intrigues leading to sordid and prolonged complications and humiliations," as presented in the "Philanderer," notwithstanding his study of Westermarck, and largely because he draws so much of his philosophy from Schopenhauer and Nietzsche.

The Wind and the Book

BY THEODORE ROBERTS

SAFE in his shaded garden-place
He sped the August afternoon
With pictured book—his pallid face
To comfort, and the hour atune.

And ever as he read the tale
Of love—rare smile and bended knee—
The wind came by and flipt the page,
And whispered something of the sea.

And ever as he read of her—
The Lady of the High Disdain—
The vagrant breeze slipt through the vines
And turned the printed page again.

And as he read that inland tale
Of courts and love and ease and pride
The wind came by and flipt the page,
And whispered something of the tide.

Between the bushes and the vines,
Between the shadow and the tree,
The wind recalled his vagrant heart
With some brave message from the sea.

* * * * *

To-night the rain is on the leaves,
Lamenting through the garden-place;
The dreamer and the wind are gone—
The book lies open on its face.

FREDERICTON, N. B.,

Literature

Paul's History of Modern England.

MR. PAUL rightly conceives of modern England* as dating from the substitution of the railway for the stage coach, but he has chosen to begin his narrative more than two decades later, with the triumph of free trade in 1846, because at that time the sudden and immense extension of railway facilities gave to free trade in England an unprecedented importance. The period covered by these volumes is nearly thirty years, from the beginning of Lord John Russell's first administration, in 1846, to the first years of Disraeli's administration, in 1874-80. It was a period of great political and social changes. During that time the Whig party was replaced by the Liberals, and the Chartists, tho failing to obtain their demands, later saw their program to a large extent adopted by both of the great traditional parties; the ever recurrent Eastern Question brought on the Crimean War; the Indian Empire was largely added to and consolidated; the position of the self-governing colonies was improved by the enlightened statesmanship of Sir William Molesworth; the great conflict for the preservation of the American Union and the abolition of slavery, a conflict intimately bound up with the economic welfare of England, was fought to a victorious issue, and an extension of the franchise established a broad electoral basis of democracy. The leading statesmen of this period were Lord Palmerston, Lord John Russell, Lord Derby, Mr. Gladstone and Mr. Disraeli. The two latter, notwithstanding their genius and eloquence, had been politically subordinate until after 1860.

The events and persons described by Mr. Paul are in a past so recent that the historian's point of view should be known as soon as possible. The reader need not try hard to discover it. In po-

litical economy, an uncompromising free-trader; in religion, opposed to the Established Church; in practical politics, an Advanced Liberal. Protection he looks upon as a childish fiscal superstition; neither the German List nor the American Carey nor the predominant economic practice of the United States, Germany and France counts for any sane purpose in Mr. Paul's estimation, and one must be prepared for decided opinions in agreement with these economic and political beliefs. In other respects the intrusion of personal views is not so pronounced, as the suggestion of political pamphleteering would be both unseemly and impossible on some topics. A brilliant and luminous style brings vividly before us some phases of the national life no less interesting than party politics, as will be seen, for example, in the account of the Oxford Movement and the description of literary tendencies and theological controversies.

The volumes with which one will naturally compare Mr. Paul's narrative are Justin McCarthy's "History of Our Own Times." Notwithstanding his dogmatism on some questions, we prefer Mr. Paul's work so far. Mr. McCarthy's all-round good nature is a hindrance in the delineation of character, and if he were not an Irish Nationalist it would be difficult to imagine that he could be in stern opposition to anything. Mr. Paul has positive opinions on topics that we have indicated, but, generally speaking, he has impartiality and insight, and his survey of a group of historic facts, more especially of a social or religious movement, is often just and penetrating.

That part of the second volume which deals with the relations between America and England during the Civil War is unusually able and interesting. The apportionment of blame for England is heavy, while the ever memorable interference of the Queen and Prince Consort in varying the terms of Lord John Russell's note to the State Department at Washington is set forth in language that all patriotic

* A HISTORY OF MODERN ENGLAND. By Herbert Paul. In five volumes. Vols. I, II and III. New York: The Macmillan Company. Price \$2.50 per volume.

Americans would do well to read. In the third volume the most instructive and brilliant chapter, that on the settlement of the Alabama Claims, is a noble plea for international arbitration.

Arabian Sources of the Mosaic Narrative

Dr. NEILSEN'S monograph* of 221 pages is one of the most suggestive pieces of investigation into the bearings of the religious ideas and practices of the ancient Arabs on the Old Testament that have appeared in many a year. With the tendency at present to rather force the importance of Assyriology for the Old Testament, it is particularly desirable to bring into bolder relief the elements in the traditions and religion of the Hebrews which connect themselves directly with ancient Arabia. In the stories of the patriarchs these two elements—the Babylono-Assyrian and the Arabic—are represented by the Abraham and Isaac "cycles," respectively, tho the commingling of the two is shown by the attribution to Abraham of traditions that are regarded as having belonged originally to the "Isaac" group.

Dr. Neilsen's book is divided into two parts. In the first he gives an admirable summary of the material furnished chiefly by the inscriptions of Southern Arabia for determining the views held by the ancient Arabs of the deity and of the seasons, and days and places which they considered as sacred. Neilsen's main thesis, that this religion was essentially a moon-cult, may be regarded as definitely established, tho he is inclined to press some of the evidence too hard. Around the moon-cult there was formed a pantheon, in which the sun and the planets Venus and Mercury represent the chief factors and the relation between the four is pictured as a family consisting of father, mother, daughter and son. The predominance of the moon-cult leads to making the month, with its natural subdivisions according to the phases of the moon, the point of departure for the recognition of certain days as sacred, and since the Hebrew

Sabbath—originally celebrated at intervals of seven days, corresponding to the phases of the moon—stands in direct connection with the moon-cult, it holds that we are justified in seeking for Arabic influences in the earliest form of the institution among the Hebrews.

Neilsen would go even further and interpret the Hebrew word "Sabbath" as the "station" or resting-place of the moon in each of its four phases. This explanation, however, will hardly meet with favor, and is a good illustration of the main defect of the suggestive work in pressing the arguments and the evidence too hard. The same remark applies to the attempt (p. 139) to find for Aaron an Arabic origin, and likewise in Neilsen's treatment of Moses the "moon" *motif* is forced beyond all reasonable bounds. One of the most valuable sections in the book is the one devoted to the rock sanctuary at Petra, discovered by G. L. Robinson in 1900, and the comparison which Neilsen institutes with the one that appears to have existed on the top of Mt. Sinai. Whether such a sanctuary actually existed or not, there is no doubt that the narrative in Exodus had one like this in mind, and the important bearing of Neilsen's most suggestive piece of reasoning remains the same, no matter what view we may take of the Biblical traditions.

The book fairly teems with brilliant suggestions and throws new and an entirely unexpected light on many problems of the Old Testament religion. Some of Neilsen's views will evoke helpful criticism, but all scholars will cheerfully acknowledge their indebtedness to him for having opened up new avenues of investigation.

The Greek Painters' Art. By Irene Weir. Pp. xvii, 361. New York: Ginn & Co. \$3 00.

The first hundred pages are improperly called an Introduction. They actually contain an account of a journey from Italy into Greece in language which it would be no injustice to call highfalutin. "Immediately after our arrival at the hotel in Athens," says the writer, "we had met an acquaintance, a somewhat learned person, who very kindly offered to accompany us on our first visit to the

* NIELSEN, DITLEF. DIE ALTARABISCHE MOND-RELIGION UND DIE MOSAISCHE UEBERLIEFERUNG. Strassburg: Trübner.

Two Portraits from the Fayum, Egypt. From Weir's "Greek Painters' Art." Ginn & Co.

Akropolis, but I unsociably declined." Having gone up later she met "Ares" and "Hebe," members of her party, who humored her whim of being alone. No mention is here made of "Apollo," who at Corinth had made an *impression* by leading "the somewhat perilous climb" up Akro-Corinth, and is described as "somewhat godlike in appearance;" but whether his coat was "opalescent" or "evanescent" is not stated. The writer's great mistake was made when she did not take "the somewhat learned person" with her. She would not then have talked of pressing with her feet "the same marble steps" that were worn smooth by the old Panathenaic procession, because she would then have learned that those steps were not there until Roman times. She herself elsewhere says, "Ah! wo to the traveler who goes to Greece with eyes untrained and mind unprepared!" Curiously the temple of Ægina is called by the antiquated name, originating in a joke, "Temple of Jupiter Panhellenios." Alexander and Darius never went hunting together (p. 210). Nor is any "struggle between Herakles and the monster Typhon" found at Athens. One wonders at the statement that the Etruscans are of "the same original stock as the Greeks" (p. 292).

Has that vexed question at last been settled? Under the head of typographical errors "Prima Parta" (p. 137) and several others might be arrayed. "Thesus" (p. 87) might almost be taken for an "amended spelling," when taken with Ædipus Kolonos" in the same paragraph. "Ethnic" (p. 113) looks like a simple blunder.

Beethoven and His Forerunners. By Daniel Gregory Mason. New York: The Macmillan Co \$1.50.

While the rather awkward title of Mr. Mason's second book is not the best that might have been chosen for it, it is at least free from the banal infelicity of his first ("From Grieg to Brahms") and the book itself is altogether a better book—a more creditable piece of writing than its predecessor. Instead of giving us a series of isolated biographical or critical sketches of the earlier composers the author has dealt with the evolution of instrumental music in the spirit of the modern philosophical historian. The forerunners of Beethoven treated *in extenso* are Haydn and Mozart. The exposition of the gradual growth of music as an art in and for itself and in its relations to the general progress of the human race is clear, succinct, scien-

tific, occasionally eloquent and imbued with illuminative power. Numerous illustrations in musical notation add an invaluable aid for the musical reader. The author's greatest limitation is indicated by his setting up of Beethoven as the final mark of musical progress—his saying that music "was brought by Beethoven to its ripe perfection, its full flowering," that "it was made to say all that, within its native limitations, it was capable of saying." Now Beethoven was a mighty man in music and his works will probably live for ages to come, as his influence must be felt to the end of time; but it nothing derogates his greatness to perceive that music is still in process of evolution. We cannot agree with this writer that the sonata form is "the best possible embodiment of variety and unity in tonal effects," and that because employed by such dissimilar composers as Haydn and Tschaikoffsky it "must obviously be founded deep in universal human psychology." The modern tone-poem in one concise, continuous movement is infinitely more vital in its unity (without sacrificing any possible effect of variety) than the old symphonic form with its four diffuse, disconnected, unrelated movements can possibly be. This means, of course, that we take issue sharply with the author's summary and supercilious condemnation of all program music and its "horde" of composers as decadent. The best program music is as "pure" and as "absolute" in its esthetic content, its tonal beauty, as any classical sonata or symphony, the poetical basic idea of which its composer neglected to make public.

The Apple of Discord; or, Temporal Power in the Catholic Church. By a Roman Catholic. 12mo, pp. 495. Buffalo: The Apple of Discord Co.

This is an unusual book. The author is evidently a Catholic priest, but he conceals his name, and the book is its own publisher. Some time ago we printed a somewhat commendatory notice of a severe book, "The Parochial School," by Father Crowley, for which we have been much criticised by certain correspondents and papers. That book was a sharp and rather loosely constructed attack on the policy of the Catholic parochial

schools, with which was attached a sharp arraignment of the morals of priests. The present volume is of a very different caliber. It is by a scholar of ecclesiastical history, equally at home in Latin, French and German bibliography, whose purpose it is to prove, what we fully believe, that the temporal power has been a curse to the Catholic Church from the day that it was first exercised. The author discusses the subject century by century, with quotations from authorities, and is free enough in calling attention to the corruptions which have arisen from civil ambition. The book is well constructed and well written, and full of damaging information. It is a mine of fact to trouble those who are burdened by the requirement laid upon priests all over the world to pray after mass for the restoration of the temporal power of the Popes. This fact is explanation enough why the author does not give his name, for his book is in danger of going on the Index, and if his name were attached he would be sure of ecclesiastical censure from his bishop or from Rome; and if in charge of a parish he would be likely to lose his living. And yet his contention is right, and it is impossible to make our American Catholics feel the least interest in the restoration of the Papal States lost by Pius IX in 1870.

Victor Hugo and Juliette Drouet. By Henry Wellington Wack. With Introduction by François Coppée. New York: G. P. Putnam's Sons. \$1.20.

During a casual ramble through the Isle of Guernsey Mr. H. Wellington Wack found a package of Mme. Juliette Drouet's letters to Victor Hugo. It appears that they had been cast out of the Hauteville House after the poet's death along with other papers and pamphlets. And their discovery proves a trifle disconcerting to Hugo's literary executor in Paris, who has "two or three thousand" of Mme. Drouet's love letters which will be published at an early date. If this is true, and if these letters published by Mr. Wack are a sample of what Mme. Drouet can do in this line, we shall have more than enough of the correspondence before we have done with it. To be sure, a woman cannot write entertaining love letters to the same man for fifty years,

which was the period covered by this intimacy between the greatest of French poets and one of the least of French actresses. Women of her peculiar type have a superlative impudence in their relations to God and to virtue generally, because they use the same vocabulary that good women do. Thus Mme. Drouet is never tired of praying for Heaven's blessing upon her disgraceful intimacy with Hugo, and she was always magnanimously willing for him to enjoy the day with his "delightful family." Mr. Wack has been taken to task, by Scottish critics in particular, for publishing these letters. But after a lapse of time sufficiently long to eliminate our sense of the flesh and blood reality of a great genius his sins are regarded not so much as scandalous as biographical. It is just as well, then, to make a biological detail of them without placing an ethical reflector behind, which would call damaging attention to the indecency. The introduction by François Coppée is

especially interesting not only on account of the view it furnishes of Hugo as seen by an enthusiastic young poet, but because of its literary excellence and the charming delicacy with which he has related his experiences.

The History of Carleton College. By Rev D. L. Leonard, D.D. Chicago: Fleming H. Revell Co.

This volume recounts the history of a Minnesota college during the presidency of James W. Strong. Carleton has a record surpassed by not one of the younger institutions and is hardly thirty years old. It has a special record in the development of astrophysics in the country and was for years the headquarters of the leading astronomical journal. It is this department that has given it scholarly fame, but its general influence comes from the true, noble, scholarly character of President Strong, a graduate himself of Beloit College, and of an unusual body of teachers whom he called to his aid.

A bas-relief of Hugo, by Professor Michel. From Wack's "The Romance of Victor Hugo and Juliette Drouet." Putnam

The instruction has been thorough; it has not gone into extreme electives; it has not tried to be a university, but it has given both scholarship and Christian character, and it deserves the good historical record which Dr. Leonard presents.

The Lunatic at Large. By J. Storer Clouston. New York: Brentano's. \$1.00.

There are some novels that suggest a hammock under a spreading chestnut tree, or vine-shaded piazza. Amusing, not too exciting, just large enough to hold comfortably in the hand while one reclines at ease, and divides his attention between his book and the bits of blue sky above and blossoming life all about him. Such a book is this cheerful story of a most diverting madman.

The Place of My Desire and Other Poems. By Edith Colby Banfield. Boston: Little, Brown & Co. \$1.25.

For the training of a poet there is probably no better discipline than the writing of sonnets. The definiteness of the form inspires a respect for structure, while its animating principle almost obliges the writer to express an idea—or at least to make a point. It is, therefore, a fortunate instinct which leads the apprentice to choose the sort of exercise which constitutes the staple of Miss Banfield's volume. The writer was a niece of Helen Jackson. And while her work is, in many respects, still tentative and transitional, it is sufficiently promising, sufficiently happy to make her untimely death regretted by all who are interested in verse.

The University of Chicago Decennial Publications, 1892-1902. First Series. 10 volumes. Chicago: The University of Chicago Press. \$40.00.

On the tenth anniversary of the founding Mr. John D. Rockefeller told of a friend who had said to him that funds contributed for the University of Chicago were money thrown away. He could well make a jest of the warning, for he was surrounded by sixteen blocks of handsome buildings, which had replaced the noisy shows of the Midway

and was addressing a thousand young men and women who were devoting their lives to the advancement of science, letters and art. Never before has a ten-year-old institution accomplished so much thorough and enduring work in both education and research as is reported in the volumes of the *Decennial Publications*. The list of titles of books and articles written by members of the faculty fills one of the large quarto volumes. Another is occupied with the history and statistics of the University, not so dry as it sounds, for President Harper has the rare genius of so marshaling figures as to make them interesting, and many educational topics of general interest are discussed. The other eight volumes contain scientific monographs, samples, as it were, of the work done in research in all departments. Here are some results of the observations on stars made by the largest telescope in the world at the Yerkes Observatory and reproductions of the best photographs of the moon ever taken. Here is a paper on the velocity of light by Professor Michelson, the inventor of the echelon spectroscope and the interferometer. Here Professor Loeb gives some of his experiments on the chemical control of nervous movements, and here Professor Davenport gives the beginning of the work at Cold Spring Harbor, which he is now carrying in the Carnegie Laboratory of Experimental Evolution. Professor Chamberlain, one of the best authorities of the world on glaciers, contributes a paper on his favorite subject. Professor Dewey, whose original ideas on methods of education have aroused so much controversy, discusses the scientific foundations of morality. The inclusion in this official publication of a severe arraignment of "excessive loan credit," by Thorstein Veblen, the nucleus of his recent book on the "Theory of Modern Business," ought to relieve the University of the charge of undue leniency toward trusts. Among the linguistic articles must be mentioned a study by Prof. C. D. Buck, of "Chicago's Babel," where 40 different languages are spoken by 1,000,000 foreigners. This collection of papers on the frontier of knowledge is a valuable set for college and public libraries.

Editorials

John Hay

WHAT a magnificent opportunity fortune gave to John Hay, and how magnificently he improved it!

He was an Indiana boy, grandson of a Baptist minister, and he went to Brown University. There he made college fame as a writer and scholar. They say that his two popular poems, "Jim Bludso" and "Little Breeches," were written in college, as a skit in the Bret Harte style, but not published till the "Pike County Ballads" appeared in 1871. Graduating from college in 1858, not twenty years old, he went into the law office of his uncle in Springfield, Ill., and was soon taken into that of Abraham Lincoln. This introduced him into politics, for these were the days of the great Senatorial fight between Lincoln and Douglas. Lincoln took greatly to the modest, versatile young scholar, and when he went to Washington as President he took Hay, now twenty-two years old, with him as Private Secretary. That put him into a relation with President Lincoln more intimate than that of any other man that has ever lived. It made it possible for him, in connection with his associate, Mr. Nicolay, to write the authoritative biography of Lincoln and to edit Lincoln's Works. It was a marvelous chance for one scarce a boy. It filled his life with memories and inspiration and experience of tremendous events and acquaintance with the greatest men of the middle century. They say that in his later years he felt himself old, altho he was but sixty-six at his death; he knew that he had lived a long life at twenty-six years of age, when Lincoln's death concluded one great period of American history. All the remaining years of his busy life his thoughts must have settled back to those stirring and fateful days of closest intimacy with the greatest figure in our Civil War. He had belonged to a past generation.

The death of Lincoln turned Mr. Hay to a diplomatic career. With the military rank of Lieutenant Colonel, under which he had served the Commander in Chief, he was sent to Paris as Secretary of Legation under John Bigelow, who still survives, older in years, but younger in spirit. Then he was Chargé d'Affaires at Vienna and Secretary of Legation at Madrid. Thus again did magnificent chances come to the young man, and still he improved them, gaining culture and information. It was in Spain that he wrote "Castilian Days," a charming book, which, however, has greatly offended certain journals that insist on mixing bad politics with their religion and have misrepresented him as if his characterization of lazy clerics were an attack on the Spanish religion.

But John Hay now sought a more active career, and returned to New York as an editor on the staff of *The Tribune*. In this service he remained five years, and it was then that he married a daughter of Amasa Stone, one of Cleveland's famous millionaires. Soon after this he moved to Cleveland, and six years later to Washington. Through his father-in-law a very large fortune came to him, and, with the exception of two years as Assistant Secretary of State under President Hayes, he devoted his time to literary work, especially to the preparation of the Life of Lincoln. But in 1897 President McKinley made him Ambassador to England, and at the end of the Spanish War he was made Secretary of State, an office which, under two Presidents, he held for seven years, until his death last Saturday morning.

They say that he was the greatest of contemporary diplomats. Such comparisons are futile; it is enough to say that still great chances came to him and he always improved them. If, as the old Greeks said, Opportunity has only a forelock, so that he cannot be seized after he has passed by, John

Hay was always alert to catch him at the ripe moment. Much of the good will and help of Great Britain during our war with Spain, when the nations of Europe were ready to combine against us, was due to his guidance. But it was as Secretary of State that he achieved historic renown. Very strange it seemed to the nations of the Old World that under him the United States should take the lead of the world in securing the integrity of China and maintaining the open door, and resisting with all the arts of diplomacy the effort of Russia to make herself master of Manchuria. What Japan is now accomplishing by force of arms, Hay secured the promise of by diplomacy, and so made it diplomatically clear that Russia was in the wrong. It was under John Hay's guidance that the United States made terms with Cuba, saved Venezuela from blockade, limited the sphere of the war in the East and gained possession of the Panama Canal. His activity covered the two hemispheres.

The characteristic of Mr. Hay's new diplomacy was its truthfulness. He believed in honesty of dealing with other nations. At first men began to talk of "shirt sleeve" diplomacy, as if frankness were something brutal. But it is understood now that we hold no *arrière pensée*. We leave chicanery to the Romanoffs, whose word no chancellery takes. Mr. Hay believed that simple, straightforward directness is good in international as well as personal affairs. This does not mean that in his correspondence Mr. Hay lacked courtesy or tact, for firmness can be polite and give no offense by any rudeness or brutality. Accordingly he had gained the good will and the respect of the diplomats of the world, who looked to him as leader in matters of great international concern.

And yet here in America John Hay seems something other and almost more than a diplomat. We think of him first as the young friend and then the biographer of Lincoln; and then we think of him as author and poet. He was one of those most loved and honored men who are able to win the admiration of statesmen and at the same

time that affection which we give to one whose deft words enter into the weft of our personal life. We have seemed to see in him something manly and loving. We are not offended if he tells us that the angel that saved Little Breeches in a snowstorm was

"In a derved sight better business
Than loafing around the Throne";

and we make no objection to the theology so long as Jim Bludso is saved because he "died for men." And we honor the man who had the good sense to feel that the inheritance of a millionaire was to give further opportunity for work and not repose, and whose gentle dignity and courtesy were as beautiful in private life as his public services were distinguished.

The Russian Mutiny

THERE is no end to the Russian disasters—or, should we not say, to Russia's disguised blessings. Every one of her defeats, every one of her internal disturbances, is a blessing, for it prepares the way for a new era of liberty and prosperity.

First the people rose in protest, the common people, the unarmed workmen of the shops; but they were put down by the rifle-fire of soldiers. Then the men of rank, the heads of local councils, of cities and districts, the kind of men who won the Magna Charta, demanded that their voice should be heard in the conclusions of war and peace, and in the government of the nation; and they were given sometimes buttered words and sometimes were forbidden to meet and speak. What cared the ducal cabal so long as they ruled the Army and Navy? Then followed the defeats of the army in Manchuria—never one victory—and then followed the destruction of the combined fleet in the Eastern waters. Only a few vessels remained penned up in Sevastopol, and a few others left over in the Black Sea. And now the crews of these vessels, ill-treated, knouted and shot by their incapable officers, are rising in mutiny, killing their officers and threatening Odessa. Nor are they suppressed, as have been the citizens in their revolt, and where shall

this end? There is disaffection in all the remaining fleet in the Baltic as well as in the Black Sea. We have the amazing news that Admiral Kruger did not dare to use force against the mutineers, fearing his own crews would mutiny, and he has dismantled his ships and dismissed his crews, while the mutinous battleship has left Russian waters and entered a Rumanian port. Are not the conditions the same everywhere? They give us news that we cannot trust; we only know that those in power who care not for the unarmed populace begin to tremble when they see men in arms seize their vessels and intimidate the second seaport in the Empire.

For how far does this disaffection extend? No man knows, but we hear that the reservists, with arms, are also mutinous, and that only the Cossacks can be trusted as yet. When fleet and army are ready to join the people out of whom they came we may hope that the end is near. What the nature of the revolution may be it is impossible to forecast, but something good must come out of all this internal revolt. Russia cannot fight a war abroad and another at home at the same time. Almost any day we may hear that General Linevitch has been surrounded and beaten by Oyama. No one expects anything else. Every one wonders why Russia does not hasten to make peace. But the war is forgotten, the army left to be enveloped and beaten, while every effort is made to put down the revolt arising everywhere. Out of it all some revolution is sure. It may not be the overthrow of the Romanoff dynasty, for Russia—so Europe says—is not ready for a republic; but at least a constitutional government is certain, in which the representatives of the people will have the right to take part in the rule of the country. Why they cannot as well rule alone, with no Czar or Emperor to interfere, we fail to understand. We are of those who believe that a republic is better even for an undeveloped nation. It has other evils than those of a despotism, but they are not greater.

But one is forced, when he thinks of Russia in the throes of revolution, with the threat of democracy before her, to look across the border to the neighboring Empire of Germany. What will the

German Emperor do in such an event? He wants no Russian republic. He was willing and glad to have his powerful neighbor weakened and humiliated somewhat, so that he might dominate Europe. But such a defeat by Japan, and such a revolution at home, he has no mind for. He has promised his Imperial neighbor that Russia may denude her borders of troops, and he will protect her against any foreign enemy. But will he equally protect her against internal revolt? That is the greatest danger now to the hopes of Russian reform and revolution. It is quite conceivable that William will, at the request of the Czar, command an army to cross the line and suppress a revolution in Warsaw or even in Moscow and St. Petersburg. We believe he would be glad of the chance to do it. But what would the German people say and do in such a case? Austria would not object; France and England could send no army to prevent him. Only the German people, half of whom are now what are called Socialists—that is, democrats, anti-imperialists—could put up an effective objection, and they do not rule the army. Is it possible that the German Reichstag might forbid the Emperor to aid his Russian cousin? It may be. Or is it possible—hardly yet—that the teachings of Marx and Tolstoy have so infected the German army that the soldiers would refuse to shoot their Russian brothers? But here, in Germany, is the chief danger to the hopes of the Russian people.

Out of war, peace. Out of oppression, liberty. Peace is the end, peace in liberty, but it usually has to come, in this evil world, by war. Against slavery there is but one remedy, rebellion. The motto of Massachusetts is not martial, but pacific for all the world: "By means of the sword we seek, under liberty, confirmed peace."

Brother Jonathan

It is doubtful if we have anywhere else except in proverbs such a concentration of wit and such a desiccated expression of ethics as in caricature. John Bull is England, as the whole world agrees, and Brother Jonathan is in every line a summary of American

character. Who does not observe a striking similarity between Abraham Lincoln and Brother Jonathan? A few touches of the pencil and a slight alteration of garments would change one into the other. Is it not true that Lincoln more than any other public man of the last half century expressed the fullness of Americanism? He was our real Brother Jonathan in flesh and blood; born in the South, but reared in the North, he was a cross of the two sections at a time when sectionalism was intensely pronounced. The solid Union was typified in his genius as well as in his features. His sentiments were a commingling of New England Puritanism and precision with Southwestern unconventionalism. He had Brother Jonathan's lankiness and he had his deliberativeness, his imperturbability and his unfailing assurance. Brother Jonathan is himself a hybrid. You get no proper analysis of the figure and the fellow by any other supposition. He is Puritanical, but he is foxy. The earlier sketches give us rather more of the Puritan, but not less of the shrewd. They make you think of wooden nutmegs.

Later sketches grow cosmopolitan. Brother Jonathan has evidently expanded his views since the earlier sketches. One might say he has become the Monroe Doctrine walking about—a personification of that peculiar assumption of duty to defend a continent. Therefore his coat tails have grown longer and his legs suggest the Pacific Railroad and an Isthmian Canal. There is a positiveness in the cut of his coat and in the retention of the pipe hat. That hat, with a band of stars, is permanently identified with American character. The beard, which is fatherly and shielding, is pointed still more to express Yankee positiveness. The nose is long and incisive, not to say meddlesome, but on no account could it be broad and alert. The mouth of John Bull is not only necessarily large, but also fleshy; that of Brother Jonathan is inevitably large, but kindly. Brother Jonathan, whatever else he does, is going to do good. He has a mission in the world. He

may take away some of the independence of his neighbors, but he intends to compensate them with better politics and better schools.

The stomach of John Bull is his chief feature, the one point that permits no abridgment. The character of Brother Jonathan allows of nothing that approximates this rotundity. He is slim, very slim, because he has no time to devote himself to such comforts as roast beef, beer and cheese. His positiveness does not permit alertness to be suggested, yet you must not fail to see that he is going to get there. His clothes are conservatively liberal. The stars indicate that he is the light of the world; the stripes indicate union, fellowship and brotherhood. His pantaloons are patriotic, yet there has been delicate reserve on the part of the artist not to represent Brother Jonathan as going much beyond patriotism. Summing up John Bull you get a pugnacious defender of Great Britain. When England goes abroad and establishes an Australian or Canadian dominion John Bull does not leave home. The artist gives an entirely different picture for Australian character and another for Canadian. But when the United States crosses to Cuba, Hawaii or the Philippines Brother Jonathan is there and unchanged. If the United States should girdle the globe there would still be no need to substantially make over the shrewd, the kindly, the imperative democrat—the man who has made identical the Golden Rule and the Declaration of Independence.

Corporations and Their Officers

THE Federal Grand Jury at Chicago indicted five of the great corporations engaged in the beef business, but it did not stop there. It also indicted separately the chief officers of those corporations. In an explanatory statement Assistant Attorney-General Pagin points out that under the Sherman act no adequate punishment can be inflicted upon a guilty corporation:

"The penalty is a fine not exceeding \$5,000, or imprisonment not exceeding one year, or both, in the discretion of the court. Of course,

a corporation cannot be imprisoned, and the punishment by fine is all that can be applied to it."

We suppose that Mr. Pagin represents directly and in a special sense the Department of Justice and Attorney-General Moody. It is quite probable that if he had been in Mr. Moody's place a few days ago he would have been very favorably impressed by the reasoning of Messrs. Harmon and Judson with respect to the case of the Atchison Railroad Company and Mr. Morton. These gentlemen said:

"The great corporations of our day cannot be imprisoned, and punishment by fine is not only inadequate, but reaches the real culprits only lightly, if at all. The evils with which we are now confronted are corporate in name, but individual in fact. Guilt is always personal. So long as officials can hide behind their corporations no remedy can be effective. When the Government searches out the guilty men and makes corporate wrongdoing mean personal punishment and dishonor, the laws will be obeyed."

They had been explaining why the violation by a corporation of an injunction directed against it *and its officers* always calls for "a rule against such of them as had control of its conduct to show cause why they should not be held personally responsible." It is true that in the beef cases we have not exactly similar conditions, and that the method of procedure is different, but it is clear that it would have been absurd to indict the corporations alone. If the law has been violated, it has been violated by officers in authority, and these can be punished. The beef companies, like the railroad companies, have been under an injunction. If an attempt to punish them for contempt had been made, it would have been both reasonable and necessary to require these officers (now indicted) to "show cause why they should not be held personally responsible."

It will be noticed that four officers or employees of one of the beef corporations have been indicted for soliciting and accepting (for the corporation) unlawful rebates from six prominent railroad companies. In giving these rebates the railroad companies not only violated a law eighteen years old, but also disobeyed an injunction directed against

them in 1902 and still in force. Evidence cited in the indictments shows that the offenses in question were committed in February, 1903, and at other times thereafter, the latest date mentioned being in January, 1904.

It seems to us that these railroad companies and their responsible officers should at least be punished for contempt. The injunctions (and the statute) have been violated by these and other railroad corporations, but we are not aware that thus far any punishment has been inflicted upon them or their officers. But the restraint of injunctions is enforced promptly and vigorously in the cases of the members of labor unions. We do not say that in such cases enforcement has been unjust or that there should have been delay. But workingmen and their leaders should not be able to say truthfully that this method of procedure is used more promptly and more vigorously against them than against great corporations, and that while those who suffer punishment for contempt in labor cases are persons, there is a manifest tendency in the Department of Justice, when corporations are concerned as defendants, to let the persons involved (the officers) avoid prosecution and the customary penalty for guilt.

Mr. Rockefeller's Last Gift

TEN millions from Mr. Rockefeller, following ten millions from Mr. Carnegie, is given to American colleges. Mr. Carnegie's was for a retiring fund, in support of superannuated instructors in colleges not denominational; Mr. Rockefeller's is for a fund to give any aid needed for colleges, excluding the great universities on the one hand, and the new and doubtful attempts at colleges on the other. Both are admirable and noble gifts. That of Mr. Rockefeller will distribute perhaps \$400,000 yearly and will give much needed help to denominational as well as other institutions.

This great gift and charge is put into the control of the General Board of Education, an organization which Mr. Rockefeller founded a few years ago and to which he gave a million dollars for the promotion of education in the South.

This is the Board of which Robert C. Ogden is Chairman, George Foster Peabody Treasurer and Wallace Buttrick and Starr J. Murphy are Secretaries. The other Trustees (four vacancies) are Frederick T. Gates, Daniel C. Gilman, Morris K. Jesup, Walter H. Page, Albert Shaw, John D. Rockefeller, Jr., Hugh H. Hanna, William R. Harper and E. Benjamin Andrews. Its work has received unstinted praise in the North, and from the more progressive men in the South. Its critics there have pretended that its object is to instil social and political ambitions among negroes. This is far from the truth. Its main work has been to develop the public school system in the South, and accordingly its disbursements have been more for white than colored youth; and so far as it has aided the latter its benefactions have been directed rather to industrial than intellectual education. What the critics have really feared is that the old Southern traditions would be undermined by the influence of Northern men and especially of Southern men imbued with Northern ideas.

It is an immense and beneficent power that is put into the hands of these men. They need unusual wisdom. Some of them are adepts in education and some of them are old, and there are vacancies. The danger to be avoided is that two or three good men, and wise, but not having all wisdom, will dominate and a certain narrowness may result. But this we do not fear. They have experience and large knowledge. And yet we are not inclined to approve the suggestion said to have come from one of them, that they be made a board of advisers to which intending givers shall be expected to intrust their benefactions for distribution. That business can belong to no one board. We have a large number of such boards already, great missionary and educational organizations. Mr. Rockefeller has used them already wisely in his benefactions, and scores of institutions have been founded by them. Givers generally have some choice as to the direction of their gifts, and it is well to have them widely distributed, according to various ideas, and for divergent purposes. Great freedom of choice will result in the most good, as each giver follows his own

bent and sees his own needs. Many times ten million dollars are given from year to year, and more and more it is seen that wealth is thus best expended.

Whether colossal wealth can be honestly acquired is a question on which casuists like to quarrel; but there can be no room for reasonable doubt that whatever money is given to the public for the good of the public is thereby made clean enough so that it will hurt nobody, and we are glad to approve the use which such men as Mr. Carnegie and Mr. Rockefeller make of a part of their stupendous and superfluous wealth.

The True Use of Ancestors

It is appropriate on the day when our ears are deafened with explosions of gunpowder patriotism that we should consider other modern manifestations of the same sentiment, and especially the astonishing growth of hereditary patriotic societies, or, to use Mrs. Harper's phrase, our "American Shintoism." There are now some twenty of these in existence, not counting those based on events later than the War for Independence. The two features which at first caused such societies to be looked upon with suspicion are the requirements that one shall be able to trace back his American lineage one or two centuries, and that his ancestor shall be an officer in the Revolutionary Army or an eminent man of the Colonial Period.

These conditions, it must be confessed, have at first sight the appearance of being somewhat un-American, and it is no wonder that the forefathers of some of the rest of us should have seen in the foundation of the Society of the Cincinnati the establishment of an hereditary aristocracy like that from which they had just freed themselves and should have denounced it as "dangerous to the peace, liberty and safety of the Union." In some States the members of the Society were disfranchised by law. But the apprehension of Thomas Jefferson, John Adams, Benjamin Franklin and Mirabeau proved unjustified. By the irony of fate the Tammany Society, which was founded as a democratic organization to oppose the aristocratic Cincinnati, developed into the nearest ap-

proach to an oligarchy that we have in America.

Since the experience of a century has removed our fear of societies based on hereditary membership, and the prejudice against them has changed to popular favor, they have now a chance to develop into institutions of great usefulness to the nation by contributing to the study of the laws of heredity and their practical application to the development of the human race. To do this, however, their pride of ancestry and their industry in delving in the records of the past must be based upon scientific principles, instead of being, as is now the case, largely blind and directed by fallacious theories of descent.

People are not devoting too much time to genealogy; in fact, not nearly enough; but their study is misdirected. For example, genealogical books are largely mere records of names, residences and dates of births, marriages, deaths. Now these are the least important, least interesting and least practical of all information that one could have about his ancestors, because these data are mostly accidental and insignificant. It is much more important to know whether one's grandfather had a semicircular ear or a bad temper or the gout than to know his name and when and where he lived.

Then, too, we are apt to take more interest in our remote ancestors than in those nearest us, when the reverse should be the case. Practically all of us have about the same heredity when we get back two or three hundred years. In the tenth generation back each of us had 1,024 ancestors or less. Now the average of one man's thousand ancestors is not materially different from that of another man's thousand, in part even the same, and mostly contemporaries of the same race, picked out in the promiscuous way in which one's ancestors were selected. We are all, kings and commoners, mixtures of the same royal and ignoble blood, and there is no use in tracing our lineage back more than one or two hundred years at the most.

Akin to this mistake is the equally common one of fixing our attention upon those few ancestors who happened to be mentioned in history and ignoring those who are less distinguished but equally

influential in deciding our character. A moment's attention to Galton's Law will show how foolish this is. According to this, which is the nearest approximation we have to the true law of heredity, the proportion of the heritage contributed by a parent in the n th generation is $(.5)^{2n}$. That is, each parent contributes on an average $\frac{1}{4}$ and each grandparent $\frac{1}{16}$ of the heritage and so on.

This shows why the son of a great genius so rarely possesses the remarkable qualities of his father and why a gifted family is so soon swamped by mediocrity. If we apply this formula to the case of a man whose great-great-grandfather was an officer in the Revolutionary Army or a signer of the Declaration we see that he probably inherits only $\frac{1}{256}$ part of his ancestor's patriotism, which is not enough to make any perceptible difference in his practical conduct. If we adopt the fantastic theory that Oliver Wendell Holmes developed in "Elsie Venner," that our ancestors take turns in controlling us for a certain time, a Revolutionary hero would have his innings on one of his living descendants about one day and a half in each year, say, on the Fourth of July and a half holiday on Washington's Birthday. The rest of the year he would behave like ordinary people.

Pilgrim Fathers are of still less use to us, for the formula counts up like the grains of wheat on the chess board and the nails in the horseshoe of the old stories. A Mayflower descendant has only one part in 65,536 of Plymouth Rock blood in his veins, which is not enough to crow about. This accounts for the fact that the modern representatives of the Puritans are so unlike their distinguished progenitors in customs, morals and religion.

But the recent researches in heredity have shown that ancient lineage is worth little attention, they have emphasized the importance of complete family records. It is of more importance to know who a man's aunt is than to know his grandfather. One of Galton's recommendations for the practical promotion of eugenics is the collection of statistics of large and thriving families in order "to

show that respect to the parents of noteworthy children which the contributors of such valuable assets to the national wealth richly deserve." According to his definitions, a "thriving family is one in which the children have gained distinctly superior positions to those who were their classmates in early life," and a large family is one that contains not less than three adult male children. This "golden book" of thriving families would form a genuine aristocracy into which it would be a real honor to marry. Some of the family histories now compiled contain so many distinguished names that they might well be the germs of such a "golden book" if the superstitions of heredity were repudiated and its real workings studied and utilized. The best way a Son of the Revolution can emulate the virtues of his ancestral hero is to imitate him by becoming an ancestor himself and founding a thriving family which shall be of service to the nation for centuries after his death.

Our Annual Children's Holocaust

FOR the last two years we have called special attention to the number of deaths incident to the celebration of the Fourth of July, and it seems proper once more to recall the statistics. In 1903 as the result of the celebration of the glorious Fourth 466 deaths occurred, and within less than a score of 4,000 were injured. There was an improvement in these statistics in 1904, and only 183 persons died from Fourth of July injuries, tho somewhat nearer to 4,000 were injured. The reason for the difference in the number of deaths is worth noting. In 1903 the deaths from tetanus amounted to 400; in 1904 there were scarcely more than 100. A discussion of these statistics brings out some very interesting facts and serves to show what are the probable reasons both for the reduction of the mortality from tetanus and the very large increase, over 50 per cent., in deaths from other injuries.

Just before the Fourth of July last year there was a newspaper crusade or, as it was very properly called by some, a campaign of education organized for the purpose of preventing at least some of

the deaths that the celebration of Independence Day brings with it every year among the children of this country. The large mortality from tetanus was made the dominant note of invective against present customs. It was pointed out that a very large proportion of the cases of tetanus occurred as a consequence of wounds by blank cartridges. As a result most of the parents throughout the country refused to allow their children to play with blank cartridges, or when injuries occurred by this means very careful precautions were taken to forestall, if possible, the development of the deservedly dreaded tetanus. Even the physicians throughout the country learned the lesson that no matter how slight a wound might be, if it was made by a blank cartridge, it must be treated deliberately as if the patient were in acute danger of contracting this fatal complication. The wounds from blank cartridges fell, according to the statistics, more than one-third. The deaths from tetanus decreased by more than 75 per cent. This latter item shows how much was accomplished by more efficient treatment.

On the other hand, the wounds from firecrackers, especially those of large size, from cannons of various kinds, from display fireworks, such as rockets and Roman candles, and from bullets, all increased in number last year. It was even remarked that there seemed to be more deaths from tetanus after some of these other forms of wounds than used to be the case, because so much attention was given to blank cartridge wounds, while the same solicitude was not felt for the treatment of the others. It is evident that all wounds from fireworks, especially if made in the street and at a time when the hands and other portions of the skin are smirched with street dirt, must be treated as if they were likely to be followed by tetanus. This is the only safeguard and, unfortunately, even this is not absolute, since it is impossible in some cases to prevent the development of tetanus.

It remains to be seen whether the improvement in the statistics last year was only spasmodic and due to the somewhat sensational newspaper efforts to call parents' and guardians' attention to the

danger or whether it was the result of serious conviction that will manifest itself not alone for the time being, but for many years. Certain it is that this year brings the usual harvest of death and suffering as a consequence of the celebration of the Glorious Fourth. At least one hundred children throughout the country will die, and probably 4,000 more will be injured. Of these only about 1,000 will be serious injuries, such as the loss of a hand, or a foot, or an eye, or some serious facial deformity; the others will consist of slighter wounds, like the loss of fingers, or burns that may cause some scarring on more or less inconspicuous parts. The din of the celebration has served to disturb many patients who were lying ill and needed rest in the midst of the unpleasantly hot weather that comes at the beginning of July. To be sure these minor considerations have little weight in keeping patriotic enthusiasm within bounds.

Professor Hilprecht

What was expected from the trustees of the University of Pennsylvania has been done—they have absolutely and completely exonerated Professor Hilprecht of all charges raised against him. They waited until the college year was over, and mid-summer had come, and time had been given for the excitement to die away, and then the anticipated verdict was rendered. He was, they say, justified in speaking, in a popular book, of tablets purchased elsewhere as a part of the so-called temple library of Nippur, because he was competent to decide that at some time, some thousands of years ago perhaps, they had been in that library. The most important piece of evidence they present is, that the tablets are marked in his handwriting with the occasion of their acquisition, and therefore he could not have intended in his popular work to represent that he had himself dug them up in the temple hill. Nevertheless it is absolutely clear that the impression he gave, and apparently meant to give, was misleading. We do not care to revive the controversy, but it is a fact that however the decision may satisfy the five men who signed the report of the investigation, and the three other men who were present and with

the five approved it, it does not and cannot satisfy scholars or the public. It is sad to think that against Dr. Hilprecht are all three of the other Assyriologists of the University, one of them, Professor Jastrow, a man of quite equal rank in the study. We must add that the committee report further that Dr. Hilprecht had retained no antiquities that did not belong to him; and that there really was a "Temple Library." When its contents are published we may begin to know; at present there is no evidence to convince any one. For by a library is meant not a lot of receipts for rent of temple land, but works of history, grammar, mythology, poetry, etc., such as have been found thus far only at Assurbanipal's library at Nineveh.

A Gift to Yale

Among the principal gifts announced for colleges last week was one of \$2,400,000 for the endowment of Harvard and another of \$2,000,000 for Yale, of which \$1,000,000 was from John D. Rockefeller. This is Yale's answer to the cry of "tainted money." Neither Yale, nor any other university or college, nor any benevolent society, imagines that, doing a good work, it is its business to scrutinize the previous history of money that comes to it from the legal owner. They believe that their use of it cleans it of any imagined "taint." They say with *Vespasian* to his son *Titus*: "*Non olet.*" They do not see why when one offers you bread you should give him a stone. A current story is passed from mouth to mouth, but we have not seen it in print, that at a resort Mr. Rockefeller met Mrs. McCormick (the families are related) and said to her: "You remember that property I bought of you? Well, it was a good thing and netted me \$200,000, and I thought I would give half of it to the Congregationalists; and do you know, Mrs. McCormick, they now say your money is tainted!"

"Radiobes" The announcement by Prof. John Butler Burke, of the Cavendish Laboratory, Cambridge, England, that he has obtained something resembling bacterial cultures by the action of radium salts upon gelatine has aroused the usual sensational

report of the spontaneous generation of life. While awaiting the full report of these experiments and their verification, it is well to bear in mind that altho there is no reason to think spontaneous generation is impossible, there is no apparent probability that man will ever be able to produce living beings from inorganic or even from dead matter. From ancient times down to within 50 years it was believed that ordinary observation conclusively proved that decaying vegetable and animal matter did bring forth new forms of life spontaneously, but the experiments of Pasteur and Tyndall showed that such putrefaction and decay were due to minute germs, bacteria, always in the air, and when a tube was sterilized by heating above the boiling point of water and then sealed or stoppered with cotton no signs of life appeared. Now Professor Burke reports that in such sealed and sterilized tubes when a minute quantity ($2\frac{1}{2}$ milligrams) of radium bromide is allowed to drop on the surface of the gelatine without opening the tube a growth begins, and, if kept in the dark, this extends downward for half an inch, very much as it would if bacterial germs had been introduced. The new bodies, which he calls "radiobes," since they are produced by radium and resemble microbes, are all of the same shape and some have a nucleus. They manifest some of the characteristics of life in that they grow to a certain size and then multiply by subdivision. They are killed by exposure to light and are dissolved by warm water. Professor Burke regards them as "highly organized bodies, altho not bacteria" and not crystals, and goes no further than to say that their behavior "suggests vitality."

The Methodist papers are still very reticent about the decision of the bishops in the case of Professor Mitchell, whose re-election, at the end of a five years' term, to a chair in the Divinity School in Boston University they declined to approve. Very large questions of inspiration and higher criticism and theological liberty are involved, but the utmost any official paper has ventured to say is the evident conclusion that under Methodist

law the trustees cannot reappoint him. Discussion does not seem to be allowed in the press. The trustees have not yet dismissed Professor Mitchell, and we surmise that they are trying, in conference with him, to draw up some statement which will induce the bishops to reconsider their action. We judge that there are two or three of them, however, who are too conservative to accept any action allowing room for the new theology in Methodist theological instruction.

The election of Payson Merrill, Esq., as one of the Yale Corporation, in place of Dr. Munger, breaks a long line of precedents, but no requirement of the charter, for there is none requiring Congregational ministers of Connecticut to succeed themselves, as often supposed. There are 19 members of the Corporation, of whom Mr. Hadley is the first layman to be President. The Governor and Lieutenant-Governor are members, and of the 16 remaining 9 are Congregational clergymen. It is a good plan to have the old custom of succession broken, for Yale is and should be in no way sectarian. But there has been no failure in the past to aim for the best ideal, as well as to reach the best accomplishment. The change is wise, but it can work no better.

What turned the scale for the coming of Sir Caspar Purden Clarke to accept the directorship of the Metropolitan Museum was, he says, that in London he would be a pensioner and officially dead in six years, while here he hopes to work more than twice as long to achieve what is his ambition for the Museum. The rule which limits the age of service does not always work well. We observe that several railroads have rescinded their rule not to take on any new man, or any one who has been laid off, after the age of thirty-five. It shut out men they wanted.

It is simply amazing that John F. Wallace, apparently for mere money, should have thrown away the chance to connect his name eternally with the Panama Canal. The world can see in it nothing more than lucre preferred to noncr.

Insurance

The Loan and Savings Company, Limited

THE Loan and Savings Company, Limited, of Montreal, is a Canadian incorporation with an authorized capital of \$250,000, with power to issue \$1,000,000 bonds. The company buys and sells real estate, mortgages, municipal, government and other bonds, patents and inventions, options of all kinds. According to its own letter heads it constructs and erects public and private improvements. It makes short loans. It also builds and sells dwelling houses, promotes and finances enterprises and underwrites stocks and bonds. The company, still quoting from its own literature, is also empowered to act as trustee for estates, and finally to act as surety for individuals and corporations. It will be seen that the company works along various lines and that its field of operations is extremely diverse. The active man in this company is Alexander Millette, or, as he prefers to sign, A. Millette. During March of this year the Loan and Savings Company, Limited, entered the United States. Advertisements similar to the one reproduced below were published in this city:

INCOME INSURANCE.

Banks pay depositors 2 per cent. to 4 per cent. per annum, while the stockholders receive 20 per cent. to 100 per cent. We offer you an investment which will place you on the same level as the bank stockholder; absolute safety and a large regular monthly income guaranteed; write for particulars and receive our booklet, entitled, "Income Assurance," describing our methods, which are meeting with great success with all classes of investors. THE LOAN & SAVINGS CO., Incorporated. Capital \$250,000. Home offices, 20 St. Alexis street, Montreal, Canada.

The editor of this department was in correspondence with the company and received in addition to other data copies of the company's income certificates. These certificates were interesting. They bound the contributors hand and foot. They boldly provided that all moneys sent to the company were at the senders' risk. They made it certain that in case the certificate holder was unable for any reason to continue his weekly payments for

the full term provided for in the instrument, even if the default took place on the last payment, all the previous payments were to be forfeited. In any event no returns by the company were to be made for a considerable period. Among the inducements offered by this company to induce people to invest their money with it on their scheme of "Income Assurance" was the promise to pay (some time) from two to four per cent. per month on the dollar. The whole scheme was idyllic in the extreme, but there was a single fly in the ointment. It wouldn't work. The beautifully engraved checks shown in the Public Tribute of Indorsement and Appreciation of this company did not prevent the bringing of various suits against the company for unpaid printing and advertising bills and on the part of certain dissatisfied contributors. Repeated requests for a financial statement of this company were barren of results, and readers of THE INDEPENDENT may draw their own inferences and conclusions.

THE advent of the summer season of 1905 has suggested to the General Accident Insurance Company of Philadelphia the renewed possibility of accidents by means of drowning. This concern has, therefore, installed sundry nickel-in-the-slot-machines at Atlantic City, N. J., by means of which visitors to this popular resort are enabled to purchase of these automatic venders accident policies paying \$100 in the event of accidental drowning while surf bathing.

...The Insurance Press has issued the Investment Directory—Insurance Companies for 1905. It contains a description and classification of bonds and stocks held by various insurance companies transacting business in the United States having at least \$100,000 (par value) of such securities. The compilation has been made by S. H. Wolfe, consulting actuary of this city. A synopsis of the laws pertaining to the investments of insurance companies as enacted by the Legislatures of the various States and Territories and the Dominion of Canada, which is included in the volume, adds to its value as a reference book for conservative investors.

Financial

The Treasury's Fiscal Year

ACCOUNTS of the fiscal year (ending June 30th) at the United States Treasury show a deficit of \$24,000,000, exceeding by \$6,000,000 the estimate made by Secretary Shaw some months ago. At the beginning of June it was about \$37,000,000, but this closing month showed a surplus of \$13,000,000. The total of receipts (about \$543,000,000) varies but little from that of the preceding year. But expenditures have grown. Under the head of civil and miscellaneous (Panama Canal payments of last year excluded before the comparison is made) there was an increase of \$15,000,000, of which more than half was due to additional postal service expenses. Other increases were as follows: War Department, \$7,000,000; Navy Department, \$14,500,000; Indian service, \$4,200,000. Pension payments (\$141,700,000) were less by about \$1,000,000 than in 1904. A prevailing belief that expenditures will continue to increase promises to stimulate discussion as to plans for enlarging the revenue by tariff legislation or additional internal taxes.

Cotton Cloth for China

AN official statement of our exports of manufactured goods for the eleven months ending with May, just issued at Washington, is unusually interesting because it shows how rapid has been the recent growth of our exports of cotton cloth to China. This is the most important part of the trade which would be affected by the threatened Chinese boycott of American imports. In the eleven months we sold to China 421,464,440 yards, valued at \$24,444,642, against only 67,862,434 yards, valued at \$3,566,900, in the corresponding months of last year. China is now taking two-thirds of all our exports of cotton cloth.

STEPS have been taken for a consolidation, in one corporation capitalized at about \$50,000,000, of all the companies engaged in the manufacture of street cars.

...Owing to conditions revealed by the recent investigation concerning

private car lines, the Rock Island Company will take up this branch of the business for itself and it has ordered 1,700 refrigerator cars.

....Since 1896 our exports to Germany have increased from \$97,897,000 to \$214,780,000, but our imports from that country have remained almost stationary, rising from \$94,240,000 to only \$109,188,000.

....Our output of copper in 1904 had a value of \$95,000,000, and about two-thirds of it was exported. At the present time the Boston and Montana Company's mines of Butte are the greatest producers of copper in the world. The Anaconda mine is second.

....A prominent French economist estimates French investments abroad as follows: Europe, \$4,053,000,000; Africa, \$712,000,000; South America, \$506,000,000; Asia, \$216,000,000; North America, \$204,000,000; Central America, \$56,000,000; Oceania, \$11,000,000.

....The North River Savings Bank, now at 266 West Thirty-fourth Street, will soon occupy its new building, which is rapidly approaching completion. This building, in the same street, but two blocks east of the one now in use, will be more convenient for a majority of the bank's 18,000 depositors. The bank has declared a dividend at the rate of 4 per cent. on deposits up to \$500, and at the rate of 3½ per cent. on those between \$500 and \$3,000.

....Dividends and coupons announced:

N. Y. Co. Nat'l Bank, 50 per cent., payable July 1st.

Mechanics and Traders Bank, 4 per cent., payable July 1st.

Twelfth Ward Bank, 3 per cent., payable July 1st.

Franklin Savs. Bank, 3½ per cent., payable July 17th.

Amer. Savs. Bank, 3½ per cent., payable July 17th.

Franklin Society, 5 per cent., payable July.

Washington Savs. Bank, to \$500, 4 per cent., payable July.

Washington Savs. Bank, \$500 to \$3000, 3½ per cent., payable July.

Des Moines & Fort Dodge R.R., Preferred, 5 per cent., payable August 1st.

Minn. & St. Louis R.R., 1st Mort 7 per cent. and 4 per cent. Coupons, payable July 1st.

N. Y. & N. J. Telephone Co., quarterly, 1½ per cent., payable July 15th.

NEW YORK, THURSDAY, JULY 13, 1905

No. 2954

Survey of the World

Elihu Root Succeeds
John Hay

When the President asked Mr. Elihu Root to go with him to the funeral of Mr. Hay in Cleveland as the special representative of the State Department, the invitation was regarded as having much significance, because it was known that Mr. Root was the President's choice for the office of Secretary of State. It was commonly thought, however, that Mr. Root could not be induced to give up his law practice, to which, when withdrawing from the Cabinet, he had returned with the purpose of building up his private fortune. In a little less than a year and a half he has been very successful in his profession, his earnings rising to the neighborhood of \$200,000 a year. After long conferences with the President during the journey to Cleveland, he consented to take the office. The official announcement of his acceptance of it was delayed until the 7th, in order that he might be sure of obtaining a release from his many professional engagements, some of which involved service for five years to come. It was then made known that within about two weeks he would take the oath. At the same time it was intimated that supervision of the Panama Canal work might be transferred to the State Department. On the evening of the 6th, Secretary Taft was in San Francisco, attending a banquet given to him by the commercial organizations of the city. In the course of an address which he made there he said:

"In his great loss, the President turns to another man, Elihu Root, of New York, a man under whom it has been my great pleasure to serve as subordinate. I know that in him we have one of the greatest constructive states-

men of the age. Happy the country, happy the President, who, having lost a Hay, can turn to a Root."

At the close of his address to the teachers of the National Educational Association at Ocean Grove, on the 7th, Mr. Roosevelt spoke of Mr. Hay and his successor. Reviewing the career of Mr. Hay, "a great statesman, who was also a great man of letters," who "had the great advantage and great merit of being able at any moment to go back to private life unless he could continue in public life on his own terms," he said that such service as he had given to his country "could not have been rendered save by a man who had before him ideals as far apart as the poles from the ideals which have in them any taint of what is base or sordid." He continued:

"I wished to get for John Hay's successor the man whom I regarded as, of all men in the country, the one best fitted to be such successor. In asking him to accept the position of Secretary of State, I was asking him to submit to a very great pecuniary sacrifice, and I never even thought of that aspect of the question, for I knew he wouldn't either. I knew that whatever other consideration he had to weigh against taking the position, the consideration of how it would affect his personal fortune would not be taken into account by Elihu Root. And he has accepted."

Hay and Root, he went on to say, were not solitary exceptions, but were typical of a large class of men in public life. We had always had at the command of the nation, in any crisis, the best ability to be found in it, and that ability had been given lavishly, altho to the great pecuniary loss of the men giving it:

"There is not in my Cabinet a man to whom it is not a financial disadvantage to stay in it."

There is not in my Cabinet one man who does not have to give up something substantial, often very much that is substantial, sometimes what it is a very real hardship for him to give up, in order that he may continue in the service of the nation and have the only reward for which he looks or for which he cares, the consciousness of having done service that was worth rendering. I hope more and more throughout this nation to see the spirit grow which makes such service possible."

The press has not overlooked the possible relation of the appointment of Mr. Root to the Republican Presidential nomination in 1908. Some expect that he will have such support for that nomination as the President can with propriety give.

Crop Reports Sold to Speculators

It has been proved that information as to the cotton crop reports of the Department of Agriculture has been sold in advance to speculators, and that the reports themselves have been manipulated in their interest. One result is the dismissal of Edwin H. Holmes, the Assistant Statistician, who sold the information and thereby has accumulated a considerable fortune. Charges relating to Holmes's operations were made at the Department about a month ago by Richard Cheatham, Secretary of the Southern Cotton Growers' Association. They have been sustained by an investigation made by secret service agents. A long report has been published. It appears that the advance information was procured by Lewis C. Van Riper, of New York, from Holmes, either directly or through the agency of Moses Haas, formerly an employee of the Department. William M. Judd, who had been employed by Van Riper, told the story to the secret service agents and induced Van Riper to follow his example. During nearly all of the last cotton season Holmes had control of the statistics, John Hyde, the Chief Statistician, being absent in Europe. Not only were the figures of the reports prematurely disclosed, but sometimes they were changed two or three days before the date of official publication, to increase the effect of them upon the cotton market and to serve the speculators' purpose. To account for his possession of the profits which he acquired, Holmes sold, or pretended to sell, to Van Riper

for \$73,000 an interest in a gold mine. Van Riper came to New York from Chicago a few years ago and is president of a promoting company called the United States Mailing and Advertising Agency. He is not a member of the Cotton Exchange. Holmes is not to be prosecuted, because there is said to be no law covering his offense. Mr. Cheatham thinks that John Hyde also should be dismissed, but the report contains no charges against him. The preparation of the crop reports will be very carefully guarded hereafter.

National Topics

United States Senator John H. Mitchell, of Oregon, was found guilty by a jury, on the morning of the 4th, of violating the law by accepting pay for his services before a Federal Department in the interest of land claims. Eleven of the jurors voted five times for conviction, and on the sixth ballot the remaining juror joined them. The Senator was recommended to the mercy of the court. The statutory penalty is imprisonment for two years, or a fine not exceeding \$10,000, or both. Other indictments against him, for subornation of perjury and for conspiracy to defraud the Government of public land, are pending, but it is reported that no use of them will be made.—Senator Alger, of Michigan, gives notice that owing to the condition of his health he will not seek a re-election next year.—The President has issued an order defining the policy to be followed hereafter in making appointments, details, assignments and promotions in the army and the navy. Having pointed out that a full official record exists in both branches of the service, showing the character, attainments and merit of every officer, he says:

"It is therefore announced that in future appointments, details, transfers and assignments in the army and navy the Executive will be guided by the official records of the War and Navy Departments, respectively, to the exclusion of other sources of influence or information; but in case an officer has performed any special act of bravery or courage, or rendered specially efficient service, of which there is no record, or only a partial record, in the War or Navy Department, the testimony of any person who was an eye-witness of the same may be submitted for consideration. Should it be discovered that since the publica-

tion of this order an officer of the army or navy has sought recommendation or support from sources outside of those named above, this fact will debar him from obtaining the particular advancement, assignment or detail which he has by such means attempted to secure, and the fact that he has sought such influence will be noted on his official record."

—Friends of Caleb Powers, charged with complicity in the assassination of Senator William Goebel, in Kentucky, have procured from Judge Cochran, of the Federal District Court, a decision providing for a transfer of the case from the State courts to that tribunal. An appeal from this decision to the Supreme Court at Washington will be taken by the State.

The Panama Isthmus

Charles E. Magoon, Governor of the Canal Zone, has been appointed Minister to Panama in order that there may be no friction between the two offices. Apparently because of assertions in published letters from the Isthmus, Chairman Shonts has given to the press a statement in which he says that it is the first duty of the Commission to create sound underlying conditions. This is "vastly more important than the removal of earth." The men, he continues, must have suitable houses in healthful surroundings, wholesome food at reasonable cost, transportation facilities and opportunity for recreation. These essentials will be provided without delay. Concerning yellow fever he says that altho there have been between 9,000 and 10,000 canal employees on the Isthmus since the disease first appeared in May, only 50 of them have been attacked by it and only 6 of these have died. During the month of July, up to the 6th, there were no new cases, and not one employee was under treatment. Wages have not been reduced, but have been increased in every branch of the service. The beginner's salary for such clerical work as that of bookkeepers, stenographers, typewriters, etc., is \$1,500. Wages in the outdoor railway service are from 10 to 25 per cent. higher than those paid in the States. Carpenters, blacksmiths and machinists receive 56 cents an hour.—The new water supply of Panama was turned on for use, with appropriate cere-

monies, on the 4th, by Governor Magoon and President Amador.

Kansas Refinery Law Unconstitutional

A part of the attack upon the Standard Oil Company by the Kansas Legislature, last winter, was an appropriation of \$410,000 for an independent oil refinery at Peru. This refinery was to be owned by the State and operated in connection with the penitentiary. Convicts were to do the work, and a building for their use was to be erected at Peru. The State Treasurer refused to sign the bonds which were to be issued for the purpose, and the Attorney-General asked for a mandamus compelling him to sign. Thus the question of the validity of the legislation came before the Supreme Court, which has now (on the 7th inst.) decided by unanimous vote that the act is unconstitutional, being in violation of that part of the Constitution which says: "The State shall never be a party in carrying on any works of internal improvement." The Court remarks that "the indictment of the Standard Oil Company" was "no doubt true, and the provocation was very great, but," it adds, "we must not make a scarecrow of the law." Governor Hoch was greatly disappointed. "If I had been the Supreme Court," said he, "I would have strained a point to declare the law constitutional."—The court also decided that the Kansas Natural Gas Company cannot hold property or do business in the State. This company, incorporated in Delaware and capitalized at \$16,000,000 in stocks and bonds, failed to obtain permission from the Charter Board to do business. Nevertheless, it went on with its work and has spent several millions in laying pipe lines, engaging to supply gas to several Kansas cities. The Eastern capitalists who control it say that its property and business will be transferred to other corporations owned by them and having Kansas charters.—It is expected that the indicted companies and officers of the Beef Trust will be tried in September. Their counsel will take the unusual step of applying to the courts for an injunction to restrain the Government from proceeding with the prose-

cution, upon the ground that, having procured some time ago a permanent injunction forbidding them to violate the law, it should now undertake to punish them for contempt and should not attack them by indictment.

Chicago's Street Railways

Some surprise has been caused in Chicago and elsewhere by the action of Mayor Dunne, in submitting to the Council a project which might defer for a considerable time direct municipal ownership and operation of the city's street railways. The Mayor asserts, however, that his opinions and purposes have undergone no change, and that municipal ownership can be reached more quickly by the plan that he suggests than in any other way. He recommends that a company (to build, acquire, and operate railways in the interest of the city) be incorporated by five citizens who enjoy the confidence of the people and who support the policy of municipal ownership; that the Council grant to this company a twenty-year franchise covering the streets in which the rights of the old companies have expired or soon will expire; that the company issue stock enough to establish railway service in those streets, that the stock be deposited with a trust company, and that on the basis of this stock marketable certificates be issued and offered for popular subscription. Dividends are to be limited to 6 per cent. and the fare is to be 5 cents, with transfers, if they can be obtained. The city is to have the right to buy out the company at any time at an appraised valuation. By this plan, he says, the people would get most of the advantages of municipal ownership and operation and avoid obstacles which would be encountered if methods which seem more direct should be adopted. About 700 miles of railway are now in use; 100 miles can be lawfully taken by the city, and 240 miles will be available within two years. If the city should decide to construct new railways, it could not itself do the work, but would be compelled to award the construction contracts to the lowest bidders. After acquiring railways, the city must ask for a vote authorizing municipal operation, and this authority can be given only by a three-

fifths majority. At last accounts there was some doubt as to the Mayor's ability to procure the adoption of his plan by the Council.

Reform in Philadelphia

The appointment of David Martin by Governor Pennypacker to be State Superintendent of Insurance, in place of Boss Durham, who resigned, is quite offensive to the reform element in Philadelphia, because of Martin's record as a ring politician. By resolutions the Committee of Seventy and the Committee of Nine have expressed their opinions. The first sees in the appointment "additional evidence" of the Governor's "hostility to reform." The second regards it as "a gratuitous affront to all honest citizens who are now seeking to redeem Philadelphia from the frightful misgovernment to which these two men [Durham and Martin] and their associates have so long condemned the city." Durham was the political "leader" of the Republican organization, and it was intended by some persons that Martin should take his place; but Mayor Weaver says that he will recognize no "leader" except the people themselves.—Altho only half of the voting lists have been inspected by agents of the reform organizations, nearly 40,000 fraudulent names have already been found.—George G. Pierie, Chief of the Bureau of City Property for several years past, has been removed for approving bills that were designed to defraud the city. In 1898 he was United States Consul at Munich.—On the night of the 1st inst. there took place the most extensive raid upon disorderly places ever made in an American city. More than 2,000 persons were arrested and five magistrates were kept busy from midnight until 9 a.m. This action was taken upon evidence procured by the Law and Order Society. It had been available for some time, but it could not be used effectively while the police force was controlled by the ring.

The End of the Concordat

The French Chamber of Deputies last week finally passed, amid great excitement, the bill for the separation of Church and State by a vote of 341 to 233, after several months of discussion,

including the resignation of M. Combes, who introduced the measure. There is no doubt as to its passing the Senate. It is a more reasonable measure than that brought in by M. Combes. It provides for the continued support of the clergy now receiving subventions from the State, but allows no support for their successors, so that gradually the amount supplied will be reduced to zero. The churches and cathedrals will belong to the State, but will be leased to congregations consisting of the churches or denominations now worshiping in them. Thus the conditions will resemble that in the United States, except that the Government will have, as in all other matters, domiciliary control much closer than here, so that it might suppress any church meetings which the Government might regard as dangerous to public order. For over three months the Chamber has done little else than to perfect this bill. There are bishops which are so impressed with the condition of the Church in the United States that they rejoice, but quietly, in the change; but the majority agree that it is, like the seizure by the people of the Papal States, an act of robbery and a great danger to the Church.

Various Continental Events

The permission given by the Pope for clericals to take part in elections has had marked effect. In the provincial elections the Moderate Clericals have prevailed in Rome, Bologna, Padua and elsewhere; but the Radicals carried Cremona and other towns. In Genoa and Leghorn the parties were about equal, but the Moderate Clericals have made substantial gains.—It had been planned that on last Sunday the French Socialist leader, M. Jaurés, should address the German Social Democrats of Berlin, but the German Government wrote to him forbidding him to be present. This has caused the Socialists more amusement than anger, inasmuch as the prohibition was sent direct, and not through the French Government, as if M. Jaurés and the Socialists were a national Power. Herr von Buelow gave as a precedent for his action that of the French Government

which had not allowed Herr Bebel and other German Socialists to speak in France, on the ground that they were taking part in political movements.—There seem to be threats of war between Norway and Sweden, and movements of troops and vessels increase the tension, but it is not believed that any real armed conflict will ensue.—The scandal about the sale of the South African army stores after the Boer war does not subside, and it has given occasion to bitter attacks on Minister Balfour. The Commission of Enquiry reported very severely as to the scandals, showing that the stores were sold at auction at a very low price, then bought back at a large price. Mr. Balfour, when asked to appoint a day for discussion in Parliament, at first refused and spoke of the matter contemptuously, but he has been compelled to yield, and has now appointed an impartial Imperial Commission to make a thorough investigation.—There was danger that, on account of the mutiny, the European Powers would be inclined to enter the Black Sea to protect their subjects, but Great Britain, which had the greatest interest there, refused to allow the convention to be broken which forbids the passage of any ships of war through the Bosphorus, and the Sultan has taken advantage of the weakness of Russia to mount heavy guns at the entrance of the Bosphorus. Evidently Turkey is less in fear of Russia than she was.

The End of the Russian Mutiny

We gave last week the story of the beginning of the mutiny in the Russian fleet in the Black Sea. This week we report its conclusion. The "Kniaz Potemkin," the largest battleship in the Black Sea, surrendered last Saturday to the Rumanian authorities. Thus far only the general facts are known as to the influences and control within the battleship; and what is reported is not always reliable even as to the more public doings of the vessel. It is probable that the mutiny was part of the extensive plans of the revolutionary party to sow disaffection in the army and navy, and this mutiny is

related in a general way to the disaffection among the reservists, who have been called to arms. On Monday of last week the Russian torpedo boat No. 267, which accompanied the "Kniaz Potemkin," attempted to enter the Rumanian port of Kustenji, but was fired on by a Rumanian cruiser and retired, and later the torpedo boat and the "Kniaz Potemkin" sailed away, having failed to get the coal and provisions desired. The Rumanian authorities were, of course, in fear of the Russian Government. They had demanded that the mutineers surrender their vessels and come on shore unarmed, in which case they would be allowed liberty to go where they pleased. This they refused to do, and sailed away. Meanwhile the loyal party on board the "Georgi Pobiebonosetz," the other principal mutinous vessel reported last week, had gained the upper hand, and had surrendered at Odessa, and a large number of the mutineers were imprisoned, and it was believed would be shot. An attempt was made to send a number of torpedo boats after the "Kniaz Potemkin" to sink her, and especially one torpedo boat was manned by volunteer officers resolved to succeed, but they failed to locate the vessel. On leaving Kustenji the mutineers were in need of coal, but they met a collier, and either purchased or seized a supply, and they seem to have replenished their provisions. Before leaving Kustenji the mutineers, who seem to have had on board an intelligent representative of the revolutionists, issued a proclamation to the Powers, declaring that they were making war on all Russian vessels that should refuse to join them, but would respect all neutral Powers. Evidently this was meant to imply that they were not pirates, but were engaged in civil war and were entitled to such recognition. At this time the Russian Government published its account of what was called "a shameful act, without parallel in the Russian navy." It says that on June 27th the crew, on the pretext of the bad quality of meat brought by a torpedo boat from Odessa, refused to eat the soup. By order

of the commander the crew was assembled on deck and Second Officer Guiliarovsky ordered those sailors who did not refuse the food to step forward. A majority of the sailors stepped forward. The second officer was beginning to write down the names of the minority who had remained behind, when they seized their rifles, which were piled on the deck, and proceeded to load them. An order to fire on the mutineers was not obeyed by the guard, and the second officer, snatching a rifle from one of the guard, fired two or three times on a sailor, wounding him mortally. The mutinous sailors then fired volleys on the officers, pursuing them to different parts of the ship. The commanding officer was killed. Some of the officers jumped into the sea, but they were fired upon and killed in the water.—On Wednesday the "Kniaz Potemkin" arrived at Theodosia, in the Crimea, and demanded coal and provisions. The Town Council allowed the provisions, but had no coal. The mutineers, however, found a British vessel loaded with coal, and got what they wanted, apparently by purchase. It was now supposed that the mutineers had gone on to join the insurrection about Batûm, but such was not the fact. The majority of the sailors had had enough of the risks of rebellion, and determined to accept the terms of surrender which they had on Monday refused from the Rumanian authorities. They therefore returned to Kustenji, reopened negotiations, and gave up their vessel to Rumania, with the condition that they should be allowed to cross any Rumanian frontier—that is, to Austria, Servia, or Bulgaria. But the torpedo boat which accompanied the "Kniaz Potemkin" refused to join in the surrender and sailed away, it was reported, to return and surrender to the Russian authorities at Odessa, on the claim that they had been forced to join the mutiny. The absolute inability of Admiral Kruger's squadron to engage the rebel vessels gives much color to the reports of a general mutinous spirit. On Sunday last Admiral Kruger reached Kustenji with his fleet,

and demanded the "Kniaz Potemkin" from the Rumanian Government, and she was surrendered to him, and Kruger sailed away with the vessel, having brought a crew to man her. The officers' cabins were found stripped of everything, and bloodstains were everywhere. The leader is said to have been Matushenko, and he opposed surrender and tried to blow up the vessel. Seven officers were found imprisoned in pitiable condition. They say that Matushenko killed ten officers. Some of the crew, especially married men, surrendered with the vessel, declaring that they had been forced to join the mutiny. The mutineers were not aware of the surrender of the "Georgi Pobiebonosetz." The transport "Prout" mutinied, and was, like the "Pobiebonosetz," subdued and the mutineers imprisoned. Indeed, it is said that some scores of the captured mutineers have been shot. But plots are everywhere in the Russian fleet, or at least great disaffection. Indeed the Russian sailors in the Russian vessels at Manila have threatened to kill their officers, so that a force of our American navy has been compelled to protect them. At Cronstadt, on the Baltic, the crew on one cruiser refused to go to sea. Even among the officers there is great disaffection, owing to the system which limits promotion to a favored few.—The losses by fire at Odessa, in connection with the mutiny, are reported to be from \$5,000,000 to \$10,000,000, and 2,000 were killed.

The Campaign in the East

The hesitation of the Japanese Government to agree to an armistice is explained by the events coming now to light. A heavy Japanese naval demonstration has been made on the island of Sakhalin, accompanied by ten transports, and the Japanese met with small resistance and landed and captured whatever ports they pleased on that rather inhospitable coast. Thus for the first time the Japanese are fixed on Russian territory which they hold and will be justified in keeping when the terms of peace come to be settled. The Russian authorities appreciate the gravity of this condition,

which to their minds seems quite as serious as the defeats on the nominally Chinese territory of Manchuria. It will be remembered that Sakhalin, the long island to the north of Japan and near Kamtschatka, was discovered by a Japanese explorer, Mamia Rimo, in 1804, and was held by the Japanese until by the treaty of January 26th, 1856, it was agreed that Russia should own the northern and Japan the southern part of Sakhalin as divided by a boundary afterward fixed at latitude 50 degrees. In 1875 Japan was forced to give up all claim to the island, receiving in exchange some comparatively worthless islands of the southern Kuriles. Even yet the Japanese fisheries are more numerous than the Russian and produce the greater part of the \$1,500,000 worth of fish caught annually from the island. The "Society for the Recovery of Sakhalin," which has been formed in Japan, estimates that if the island were under Japanese control the value of the fisheries could be increased ten fold and the fishermen would be relieved of the burden of paying the heavy taxes imposed by the Russian Government. Besides the fisheries the mineral wealth of Sakhalin is considerable. The production of coal is now 25,000 tons, and some petroleum is produced by convict labor, but both could be largely increased. The total population of the island, according to data published by *L'Européen*, is about 40,000, of which 23,251 are Russian convicts, 11,997 "honest persons"—that is, soldiers and officials, and 4,140 aborigines. The latter include 1,912 Guilaks, 1,296 Ainos, 773 Onoks and 157 Tunguses. The Russians have used the island as a penal colony ever since it came into their possession, but the number of convicts has not increased in the last ten years. About a tenth of the convicts are women. During the present war the population have suffered extremely from famine, for the collapse of the Russian navy has cut off their supplies. The famine was so severe during the winter that the people ate their dogs. Very little can be raised on the island except potatoes and some root crops. The mean temperature for January is—6.1 degrees F.; for March, 16.3 degrees; for August, 64 degrees; for November,

25.2 degrees. The area of Sakhalin is about 29,000 square miles, mostly mountainous.—Meanwhile the strong division which the Japanese have sent up through Korea toward Vladivostok has been making good progress and at last accounts was near the Tumen River, which separates Korea from Russian territory. It must be remembered that Korea runs north along the coast far beyond the peninsula of Korea, and comes very close to Vladivostok, reaching to Possiet Bay. We may hear any day that this force has crossed the Tumen into Russian territory and has cut the railroad connecting Vladivostok with Harbin, thus giving Japan a claim to hold Vladivostok when peace conditions are considered. General Linievitch is quite unable to do anything to resist this advance, as he is held with his inferior force by Oyama, and any weakening of his defense would cause the loss of Harbin, which must be defended at all costs. It is believed that Russia has made certain advances to Japan with a view to an armistice, but with no success as yet, notwithstanding President Roosevelt's suggestion to both parties. Indeed, it seems to be impolitic for Japan to suspend operations when just about to reach most important results.

Revolutionary Poland

The revolt in Poland seems to have been mostly suppressed by the vigorous measures taken at Lodz by General Suttleworth, who is known as a Jew hater. His coming led to the flight of many thousand Jews, while over a thousand of the Socialist agitators were arrested. Polish patriots regard the efforts of the Polish and Jewish Socialistic parties to bring about a revolt in Russian Poland as useless. They are determined not to waste the energies of the Polish nation in a vain attempt. They understand that this moment is least suitable for an armed revolt against Russia, since neither the external nor the internal conditions are favorable. There is no suitable arrangement for international relations, nor has the whole of the Polish nation—in bondage for more than a century—sufficient national consciousness; nor, finally, have the Poles sufficient arms and funds. In this sense the Polish

National Democrats have consistently acted against the Socialists' instigation to an armed revolt. After much sacrifice of life in Polish cities, one of the Polish Socialist parties—the Polish Socialist Party—recognized its blunder and issued in May a manifesto declaring that “the time has not yet arrived to start a revolution.” Russia has enough troops of her own at home to suppress a rebellion in Poland, and in that task she can rely implicitly on the willing co-operation of Germany and Austria, her partners in the partition of the Polish Republic; but the Government, owing to the war with Japan, is in a mood to make concessions, of which condition the Poles should avail themselves in order to initiate a struggle for their rights. With the object, then, of turning Russia's plight to the advantage of the Polish nation the Polish National Democratic Party, or, as it is popularly called, the Pan-Polish Party, undertook, as the first step of a broad political action, the struggle for the Polish language in the commune. The political program of which this struggle is the first step aims at the broad autonomy of the “Kingdom of Poland,” formed by the Congress of Vienna in 1815—that is, the complete separateness of the political constitution, of legislation, of the system of administration, of the judiciary, of public education and finances—based on its recognition as a country absolutely Polish.—In November the National Democratic Party issued an address to all the communes in the Kingdom of Poland to remove the Russian language from communal administration by means of formal resolutions at their quarterly assemblies. The authorities used all endeavors to prevent such action being taken by the communal assemblies, but the peasants eagerly and earnestly heeded the signal of the National Democratic Party, and, according to the latest reports, resolutions demanding administration in the Polish language have been adopted by over 300 communes, which represent a population of almost 2,000,000. This movement of the Polish peasants proclaiming the rights of the Polish language in public life is probably the profoundest revolution in the history of Poland.

The Identification of John Paul Jones's Body

BY THE PROFESSORS OF THE PARIS ANTHROPOLOGICAL SCHOOL

[General Horace Porter, ably supported by the Second Secretary of the American Embassy in Paris, Colonel Bailly-Blanchard, succeeded last spring after a long search in discovering, in an abandoned Protestant cemetery in Paris, the body of John Paul Jones. There has been a tendency in some quarters, both in France and the United States, to question the authenticity of these remains. The proof of their genuineness rests almost wholly on the conclusions reached by the professors of the Paris Anthropological School, who were charged by General Porter to examine the body and to draw up a report. The three professors present at this important autopsy were Doctors Papillault, Capitan and Hervé, all scientists of first-class ability. Dr. Georges Hervé has devoted his whole life to the anthropological sciences, has been president of the Paris Anthropological Society, and has written numerous monographs and volumes on these subjects. Such a body of men speak with authority. They give below the gist of the report which they laid before the United States Embassy.—EDITOR.]

I.

AMONG the names signed at the bottom of the document disclosing the identity of the body of John Paul Jones, which document will be deposited, I understand, in the national archives at Washington, were those of three professors of the Paris School of Anthropology, Drs. Capitan, Papillault and the author of these lines.

Dr. Louis Capitan was born in Paris in 1854. An eminent archeologist and palæethnographer, he is also a distinguished physician. Professor Capitan has devoted many years to the study of primitive human industries, and hence it is that he fills to-day at the Anthropological School the chair formerly occupied by his teacher, Gabriel de Mortillet, one of the great creators of prehistoric science.

Dr. Capitan began his career in 1874 in the laboratory of the famous Dr. Claude Bernard, of the College of France. In 1878 he became house surgeon in one of the Paris hospitals and in 1880 he founded at the Paris Medical School, with Professor Bouchard, the laboratory of general pathology and therapeutics, where bacteriologic experiments were made for the first time in that institution. He was at the head of this laboratory from 1883 to 1888. In 1885 he became the head of the medical clinic in the Paris Hôtel Dieu Hospital and in 1892 lecturer on pathological anthropology at the Anthropological

School. From 1894 to 1897 he was professor of medical geography in that school, and in 1898 succeeded M. de Mortillet as professor of prehistoric anthropology.

In 1902 Professor Capitan was chosen vice-president of the French Biological Society, and in 1899 president of the Anthropological Society. He is, furthermore, officer or member of a number of other French or foreign learned and scientific societies.

Dr. Capitan is a most voluminous writer in various scientific fields, and if I were to give a list of his monographs, memoirs, etc., written during the past twenty-five years, the number would exceed 250, and even then the list would not include his many contributions to scientific and medical periodicals.

In bacteriology and experimental pathology Dr. Capitan has made several notable microbic discoveries, and in therapeutics he has also done much good work. He is the possessor of a rich prehistoric collection brought together by his own efforts, the result of numerous explorations and remarkable excavations. He stands to-day one of the first French authorities on palæethnography; has published more than 120 notes or memoirs on this science in different French scientific periodicals, and is, in a word, a scientist of the first order, whose activity embraces a large number of subjects.

Dr. Georges Papillault is a younger

man, having been born in 1863. While studying law he became interested in science and in 1896 took his medical degree, defending an anthropological thesis which received the highest praise from the Board of Examiners. In 1897 he was attached to the anthropological laboratory of the School of Superior Studies of the Paris University and the next year became its assistant director. He was called in 1899 to the Paris Anthropological School, where he became assistant professor in 1902 and full professor last year. His work and publications have been confined more particularly to the department of intellectual and social phenomena.

Professor Papillault is an officer or member of several learned and scientific societies both at home and abroad, and the author of numerous scientific articles. His most recent and most important work is entitled "The Average Parisian," and is a study of the proportions of the body and of their variations according to sex and stature of the inhabitants of the French capital. The work is based on the study of two hundred bodies and has been utilized, as will be seen in his article, which follows mine, in identifying the body of Admiral Jones.

To the many scientific honors so briefly enumerated above these two *savants* may now add another, that of having successfully determined, 113 years after death, the identity of the remains of a naval hero whose body was discovered by the activity of General Horace Porter and honored by the patriotism of President Roosevelt.

GEORGES HERVÉ.

II.

WHEN discovered no plate was found on the coffin containing the remains of John Paul Jones. It might have been stolen by the grave diggers at a later burial, or there may never have been any, as it was expected at the time of the interment that the body was to rest but a short time in French soil. Was it possible to substitute for this plate a scientific proof of identification? This was the question General Porter put to me, and my reply is found in the following article. My eminent colleague, Dr. Capitan, was good enough to aid me in this

delicate task, examining the internal organs and the viscera of the body, while I confined my attention to the morphological characteristics of the body and to the general examination.

The problem which we had to solve was especially difficult and complex. In the first place, it was necessary to study all the historical documents concerning the Admiral which it had been possible to bring together and to compare them with the data furnished by a careful examination of the body. A single well established discord between these two sets of facts would suffice to put an end to the demonstration. But in this respect, on the contrary, the results were perfectly satisfactory, as will be seen further on in this article. However, this was not enough to prove what we had in view. It had to be shown that these cases of agreement were not simple coincidents springing from mere chance. We had to establish the impossibility of such a conjunction by taking into account the large number of proofs and the quality and value of each one of them. It is this double demonstration which I am going to try and put before the reader as clearly as possible, so that he can judge for himself, with all the facts before him, just what we have proved.

There is very little exact information bearing on the physical characteristics of Paul Jones. But that which Colonel Bailly-Blanchard, Second Secretary of the American Embassy, was able to collect was of no slight importance. It enabled us to greatly limit the circle of our examination.

At the time of his death Jones was forty-five years old. The age of a person at the time of his decease cannot be exactly fixed by the examination of his corpse. But the teeth and hair can establish the period of life that had been attained. The Admiral's teeth are quite long and somewhat worn. His hair is very long and thick. It is thin above the temples and white hairs are beginning to appear here and there. It was evident, therefore, that the body before us had reached maturity and could have the age which Paul Jones had.

The Admiral is known to have been dark complexioned. I had some trouble

in freeing a few locks of his hair from the matter which the embalming liquid had deposited upon them. But I could in the end put beyond doubt that his hair was brown.

His height was known. This was a most important fact. Here were exact figures which immediately excluded a vast number of individuals. But let me

ured standing, when he had one meter and seventy centimeters. Now if I had before me the corpse of John Paul Jones, which was of course in a reclining position, it ought to measure a little more than the length just given. And such, in fact, was the case. The horizontal measuring instruments which I used in my laboratory for this purpose marked,

GEORGES HERVE

first call attention to the established fact that the height of a person is not always the same. It may vary a centimeter during a day, depending on the state of fatigue of the body. In a reclining position the body is apt to be longer than when measured in a standing position, as in the latter case the weight of the body is pressing on the articulations. It is evident that the Admiral was meas-

ured standing, when he had one meter and seventy centimeters.

Thus it happens that the description of the Admiral left us by his contemporaries tallies in a very satisfactory manner with the corpse which I was called upon to examine. In both cases it was a man in his maturity, with brown hair and 1 meter 70 tall.

Tho these first results were very encouraging, we could not stop there.

There exist two busts of the Admiral made by the well-known French sculptor of the period, Houdon. One of these belongs to the Marquis de Biron and the other is from a Philadelphia gallery. A replica of the latter is to be found in the collection of casts in the Trocadéro Museum here in Paris. Both of these were placed at my disposal. But, after a careful examination, I utilized only the Philadelphia bust, and for this reason: Tho both of the busts appeared to be authentic, one was evidently far more valuable for my purpose than the other. They were surely made at widely different periods, and the aim and method of the sculptor were not the same in both instances. The Philadelphia bust represents the Admiral in uniform. The head is energetic and the pose that of one commanding. It is plain that the artist is copying life. The modeling is very studied and precise. Every wrinkle of the skin is reproduced. You feel that this is a likeness.

A very different impression is made upon you by the terra cotta bust belonging to the Marquis de Biron. The rough sailor has become a courtier. The hair is not brushed smooth, as in the first bust, but is curled and done up in elegant braids. The face is made more refined. The artist has attenuated its energy and diminished its robustness. The protuberances of the forehead are effaced. It is a work full of grace and spirit, but rather conventional. Houdon wished to flatter the weakness of him who had become "so careful in his dress that it was remarked." There was but one detail in this bust that was worthy of note in connection with the matter in hand, and this detail was an important one: the hair was arranged exactly as in the corpse before me.

An explanatory remark is necessary in this connection. One must not expect to find the traits exactly the same in a bust and in the dead face. The former represents living tissues, filled out by the blood which animated them; whereas, in the second case, we have before us a skeleton covered with tissues, hardened in this instance by alcohol. Furthermore, a sculptor rarely takes many measures. When he has noted the principal guiding marks he generally lays aside

his compasses and devotes his attention to catching the expression of the face and getting a likeness. But it is essential that the height of the forehead, the length of the nose, upper lip, chin, etc., be exact, or there will be slight resemblance between the bust and the original. So I felt that this work of Houdon should aid greatly in solving the problem.

Again, it should be remembered that the variations of the human face and of its different parts are many and great. Each one of the parts of a head of a given size may vary proportionally at least a third. If, then, we find an agreement in the bust and the head under examination as regards general characteristics and dimensions we may be pretty sure that the first is a copy of the second, this probability increasing with the augmentation of the number of resemblances. Let us, in the first place, examine the purely descriptive characteristics and afterward we will take up the question of the measures.

The hair has the same implantation and the temples are bare, as has been already said. The forehead is quite straight, rounded and has pronounced frontal bumps. The superciliary arches are quite prominent, whereas the globella—the smooth prominence on the forehead just above the root of the nose—is, on the contrary, but slightly indicated. The cheek bones are high and quite large. The root of the nose does not turn in, as frequently happens, and the bridge is thin. The profile of the face is straight and does not present the protrusiveness of the jaws called prognathism. The chin is not protrusive, but rather retreating, and is solid and robust. Professor Hervé, who was present throughout the examination, pointed out resemblances also in the ears of the body and the bust. There is, therefore, a strong general likeness between bust and face.

The measures, taken in accordance with the most approved methods of anthropometry, as taught by me in the laboratory founded by Broca, produced still more conclusive results. Thus, the length of the face from the point where the roots of the hair began to the end of the chin was exactly the same in the

body and the bust—viz., 19.5. The distance from the roots of the hair to the lower end of the cartilage separating the nostrils is 12.7 in the bust and 12.9 in the corpse; from this latter point to the end of the chin, 7.5 and 7.4; the length of the upper lip, 2.4 and 2.5, and from the opening of the mouth to the bottom of the chin, 4.6 in both cases.

The measures of width are more difficult of comparison, for they were based, when taken for the bust, on the soft parts of the face, which have now been considerably modified by maceration. One only can be considered exact—viz., the width of the forehead, which I found to be 10.4 in the bust and 10.2 on the dead face.

I had not hoped for such extraordinary approximation. There are no precise limits to the parts of the face. They are rounded surfaces on which one always feels some hesitation in placing the points of the compasses. I allow my pupils variations of from two to three millimeters when they take measures, though they all practice the same method and employ the same instruments. I do not know what system Houdon employed, but I suppose he used those far from precise compasses which one still sees in sculptors' studios. It will, therefore, be easily understood how surprised I was when I found such striking similarity in these two sets of measures.

Some years ago I made some studies concerning the modifications and deformations which characterize the work of artists when they copy nature. I measured the models first and the statues afterward and tried to arrive at some rules governing the matter. I gave especial attention to the work of our

great sculptor Dalou, who was remarkable for veracity in art and whose excessive use of the compasses was even criticised by his fellow artists. I examined particularly the bust of the famous revolutionist Blanqui, the plaster cast of whose face was used for this bust and carefully followed. It is much easier to take measures from a plaster cast than from the living face, and yet I found that in this instance there were errors ranging from two to four millimeters. Houdon's exactness is notable and was

most valuable in this labor which I now had in hand.

Now let us consider the weight to be attached to the data which had so far been accumulated. The age, height, color of the hair and six dimensions of the face, which were known, were also found repeated in the corpse. The same is true of certain descriptive characteristics, as we have just seen. Now let us see how far these go to the identification of the body. With this end in view I utilized a series of

LOUIS CAPITAN

two hundred bodies on which I made, some years ago, a certain number of measures. I have carefully examined these measures to see if any of them correspond with those pertaining to John Paul Jones. I first threw out half of the subjects because they were women. This left one hundred male bodies. Of these only about ten had the right height, and only half of these ten had hair that could be said to be brown; nor had I eliminated from this little group those who were too young to have occasional gray hairs. But when the face measures were considered I found that not one had the same length as the Admiral's face. This experiment demonstrates the fact that

one hundred corpses, taken at hazard, were immediately eliminated on applying to them but three of the characteristics peculiar to the Admiral. Let us suppose that we had found among several thousand bodies five having the same height, the same colored hair and the same length of face as the Admiral; it is easy to imagine how quickly they would be pushed aside when tried by the five other face dimensions. It is evident, therefore, that an enormous number of subjects would have to be examined before we could hope to find one that would correspond, more or less exactly, with the figures before us; and, this subject found, the general resemblances of cheek bones, forehead, etc., would still be necessary before any useful conclusions could be drawn.

This almost complete material impossibility to find two subjects having the same anthropometric proportions is due to the enormous variations which these proportions present among different individuals, as has been already stated. It is for this that the Paris police can so rapidly recognize a criminal arrested for the second time. The system of anthropometric measurements makes it possible to eliminate in a moment thousands of individuals and to hit upon the only person who fits the measures and is trying to hide his identity.

It may be objected with some truth that we have not perfectly sure measures. But it should also be remembered that in the case before us we are not required to select from a thousand different subjects. The uncertainty could affect but a very small number of dead bodies, buried under certain conditions—in a lead coffin, for instance, which was the case with Paul Jones—and in a fixed place, which, in this instance, was a little abandoned Protestant cemetery. So from such a very small number, in order that my reasoning should break down, would have to be produced another body resembling the one before me, when experience shows that such a result cannot be produced in a vast series. Brought face to face with the impossibility of such a hypothesis, an impartial mind must accept the only reasonable view and admit that we had before us the other day at the Paris Medical School

the authentic remains of John Paul Jones.

Criminals are often condemned on proofs less concordant than those I have just given, and yet we have still further evidence in favor of the thesis I am sustaining. Dr. Capitan's autopsy is another strong voucher. The disease of which John Paul Jones died is known and Dr. Capitan found indisputable traces of it in the organs and viscera. Nor is this the last warrant.

At the very start we had carefully examined all the linen in the coffin, hoping to find some initials on it. But all our efforts in that direction had failed. The shroud was a sheet whose ends had been cut off in order that it should fit the coffin, so that the place where the mark would be was missing. The shirt, which was of fine linen, was discolored in parts by the embalming liquid, and notwithstanding all my efforts to clean it and remove extraneous matter I could discover no letters of any kind. But there remained one article which a long washing succeeded in cleansing. I refer to the linen bag which held the very long hair of the Admiral, neatly arranged and done up in accordance with the fashion of the time. I found here a mark, whose peculiar form was significant. Looked at in one position it was a P, the loop being very small. Turned upside down it became a J. We evidently had here a monogram representing the initials of the Admiral's name.

This discovery was made at the very moment when I presented my report in the presence of the members of the American Embassy, the Prefect of Police, the Prefect of the Seine and several scientific persons invited by General Porter to be present, all of whom signed the written document approving our conclusions. This discovery was a final and touching proof of the correctness of our demonstration. As the living advanced one by one to sign the official report of identification, the dead hero seemed to rise in his coffin and thus affix his own sign-manual to the document, as if eager to end all these long formalities and finally return to repose in that land which he served so well.

GEORGES PAPILLAUT.

III.

I GIVE below a brief account of the autopsy of the body of John Paul Jones and my anatomico-pathological remarks thereon.

When the lead coffin was opened I found the body packed around with straw and hay and thoroughly soaked in an alcoholic liquid. An orifice, now closed, in the upper part of the coffin had evidently been used for the introduction of this liquid, which had escaped at a much later period through a break in the coffin. The body, whose color was a grayish brown, presents still a remarkable suppleness of the teguments. The skin, hair, muscles, every part, in a word, is in a wonderful state of preservation.

I immediately proceeded to an anatomico-pathological examination to discover if the viscera showed any traces of the diseases which Admiral Jones was known to have suffered from during his life. It is an established fact that he long had a bad cough before falling into the decline which carried him off and which produced a very noticeable swell-

ing of the lower limbs and pulmonary hydropsy.

So on April 13th last I made the autopsy, the first time, perhaps, that such a thing has been done 113 years after death. I found the heart and lungs strongly impregnated with the alcohol. I took out the liver and noticed that it still contained bile of a dark yellow color and thick. The spleen was rather shrunken. The kidneys were somewhat small. The lungs were filled with minute whitish bodies resembling tubercular nodules. The skin of the lower members also contained analogous granulations. The intestines were very much retracted in the lower part of the iliac region.

Professor Cornil, who fills with so much distinction the chair of pathological anatomy in our Paris Medical School, examined the viscera. We found the heart normal, the liver scarcely affected, and the lungs, to which particular attention was given, showing unquestionable evidence of a cured attack of bronchopneumonia. We concluded, therefore,

The Room at the Paris Medical School Where the Autopsy of Paul Jones Was Performed

that the body before us had suffered from serious pulmonary complications. It is known that such was the case with Paul Jones.

An examination of the kidneys made it possible for Professor Cornil to formulate, what we were sure would be the case, the diagnosis of chronic inflammation of those organs, frequently accompanied by the swelling of the lower limbs especially, and other related phenomena, all of which Jones was

known to be subjected to. Here was a fresh and curious proof of various pathological troubles corresponding exactly to the different morbid diseases from which he suffered through life. These facts, joined with those furnished from other sources, offer another irrefutable argument in favor of our contention that the body which we examined can be none other than that of John Paul Jones.

LOUIS CAPITAN.

Our Old Parliament and Our New Speaker

BY JUSTIN McCARTHY

THE only event calling for much notice in the recent doings of our expiring Parliament has been the resignation of the late and the election of the present Speaker. The late Speaker

was Mr. Gully, or, to give him his full title, The Right Honorable William Court Gully, who has been a member of the House of Commons since 1886. Mr. Gully is a lawyer by profession and won some distinction as a pleader of the bar and as a Recorder. He resigned his high position as Speaker because of growing ill health and advancing years, altho in our days of long-living public men he would hardly be regarded as entirely past his working time, for he is only in his seventieth year. Mr. Gully is in appearance, in manner and in voice the very type of what we should look for in a Speaker of the House of Commons. He is tall, dignified and stately, has a manner at once impressive and yet winning, and he certainly made himself very popular with the House in general.

The speeches which were made on the occasion of his tendering his resignation came from all parties in the House and the majority of them did not assuredly fall short in words of adulation. I had a seat in the House of Commons for some years after Mr. Gully's election to the Speaker's chair and I always found him most courteous and agreeable, but I cannot help thinking that a stranger listening to some of the speeches delivered on the occasion which I am describing might have thought that the House had never known so marvelously perfect a

The Right Honorable James William Lawther,
Newly-Elected Speaker of the House of Commons

presiding officer before. My own impression was that Mr. Gully sometimes went a little out of his way to make himself agreeable to the ruling party in the House, and there were some occasions when I could not help believing that he exerted his authority with a certain harshness against the persevering members of a minority. Mr. Redmond, the leader of the Irish National Party, made reference very moderately and composedly but at the same time firmly to the occasion when the late Speaker created a new precedent in the forms of the House by calling in the aid of the police force to remove certain Irish National members who refused to leave their places at the word of command. I know that many English members who have no particular sympathy with the Home Rule cause were of opinion at the time that Mr. Gully had gone too far and needlessly in this assertion of his authority, and I feel well assured that there were some former occupants of the Speaker's Chair—Lord Peel for one—who could, while maintaining the full authority of the Chair, have found an easier way out of the difficulty and without the introduction of any novel precedent. I do not offer this opinion because of any desire to disparage Mr. Gully, who, on the whole, filled his position with great credit to himself and satisfaction to the House, but because I do not desire that American readers should accept unreservedly the eulogies which were poured out on the retiring Speaker when he announced his resignation. Mr. Gully will now be endowed by the Crown with a peerage and a pension, and we can all sincerely hope that his years of retirement may be many and happy.

The new Speaker is the Right Honorable James William Lowther, whose election took place without opposition on the day after Mr. Gully's retirement. Mr. Lowther has for some years held the

The Right Honorable William C. Gully, Retiring Speaker of the House of Commons

important office of Chairman of Committees and Deputy Speaker of the House, a position which of course gave him the right of presiding over the meetings of the House when the House was in Committee. He is twenty years younger than the late Speaker and is a man of marked ability, thoroughly acquainted with all the forms and manners of the House, and, altho a strong Conservative in politics, has not allowed the spirit of party to influence him in his decisions or with his dealings with members in general. He will not present to the House so stately a presence and so dignified a demeanor as did Mr. Gully, who might well have stood for a painter or sculptor as a living model of the ideal President of the House of Commons. But I do not suppose that under all the

conditions the present House could well have made a better choice. There will probably be some fierce Parliamentary struggles yet to come before the General Election, and I hope there is good reason to assume that Mr. Lowther will prove himself equal to such occasions and will maintain that resolute impartiality which the House, to do it justice, always desires to be the leading characteristic of its presiding officer.

Just now the members of both Parliamentary houses, Lords and Commons, are enjoying, or at least are supposed to be enjoying, their short interval of Whitsuntide holiday. The weather throughout England has certainly not smiled upon their brief interval of recreation. " 'Tis morn of merry June, I trow," is a line from Walter Scott's ballad, and English poets have habitually gone into raptures over the delights of our June days; but our present June has been little else than a succession of darksome skies, chill rains and stormy winds. Jean Paul Richter says of an early summer which came within his experience that "it is not summer, but only at the best a winter painted green." This is exactly the kind of summer in which we have been reveling thus far in these days of June.

Amid all the excitement caused by the short visit of King Alfonso, the youthful monarch of Spain, a visit which seems to have positively bewildered for the time the streets of London, and amid also the deep interest taken everywhere in the resolute and beneficent part adopted by President Roosevelt in the interests of peace, the intelligence of the country has yet been able to give a welcome to the new United States Ambassador, Mr. Whitelaw Reid. There is a strong feeling of approval among Englishmen in general and among the whole of my own countrymen as to the policy so bravely and wisely adopted by President Roosevelt, and Mr. Whitelaw Reid begins his career as Ambassador under the happier auspices on that account.

Mr. Reid presented himself before this at the British Court in the character of Special Envoy on the occasion of the late Queen Victoria's Diamond Jubilee, but his visit then was of short duration, had to do merely with ceremonial functions and did not carry with it any strictly

diplomatic mission. Now that he comes as Ambassador from the United States we must all wish for him a successful career. Many years have passed since I last saw Mr. Reid, but I was in friendly association with him at different periods. I well remember that during my first visit to the United States I had the pleasure of making the acquaintance of Mr. Reid in New York, and that was during the first year of his settlement in the city as one of the editorial staff of the *Daily Tribune*. My stay in the United States, of which New York made my headquarters, at that time lasted for two years, and as Mr. Reid and I had many friends in common we had frequent opportunities of meeting, and I formed a high and well justified estimate of his literary abilities, his winning manners and his great personal capacity. In two subsequent visits to the States, which took place at considerable intervals, I had again many opportunities of meeting Mr. Reid and received many kindly and welcome marks of friendship from him. Since the last of these visits we have not met, but I still retain the same warm regard for him and have followed with admiration his ever-rising and ever-brilliant career. I feel well convinced that the growing sentiment of friendliness and sympathy between these countries and the United States will grow closer and warmer because of the policy and the bearing of the new Ambassador from the great Republic.

I must turn now to a less genial topic: I must say something to my countrymen in the United States and to my American readers in general about the death of my dear old friend and for many late years political comrade James Francis Xavier O'Brien, one of the Irish National Party in the House of Commons, a man who devoted his whole life to the service of his country. O'Brien passed much of his early life in the Southern States of America and was, I believe, actually engaged in some of the once famous expeditions under William Walker, the leader of the "Lone Star" enterprise. O'Brien led for a time a life of "sturt and strife," to quote the words of a Scottish ballad; but after a while he returned to the arts of peace and constitutional agitation and came back to his

own country, where he devoted himself absolutely to the service of the National movement under Charles Stewart Parnell. He entered the House of Commons and for many years took an official and directing part in many National organizations for the promotion of the Home Rule movement and the reform of the land tenure system in Ireland. He was then and ever since continued to be a thoroughly constitutional agitator, and his influence was always on the side of peaceful and Parliamentary movements. He was a man of modest and entirely unobtrusive manners, was ever obedient to the word of command from his leaders, and indeed was in appearance a man of fragile frame and delicate nerves, with whom one who did not know him would never have associated any idea of that daring and revolutionary temperament which inspired his earlier career. I have never known a man more thoroughly devoted to the cause of his country, and his exalted principles of morality guided him in every work he undertook. His death is a great loss to the Irish people and has created a feeling of the deepest regret among Irish Nationalists all over the world. His name will ever be honorably and sympathetically remembered by the people for whom he worked during all his later life with such absolute unselfishness and devotion.

A work of much political and literary interest is to be given to the world in the biography of the late Sir William Vernon Harcourt. Mr. Lewis Harcourt, son of the late statesman and Parliamentary orator, is to be the author of the biography. I believe that Mr. Harcourt has already written to many friends of his late father in England and in other countries requesting them to give him an opportunity of reading any letters from Sir William V. Harcourt which might be of interest to the reading world and help to illustrate the statesman's habits, sentiments, sympathies and ways of thought. Mr. Harcourt has, I am told, resolved wisely to take his full time over the book and to make it as nearly as possible a perfect exposition of a most valuable life. Sir William V. Harcourt was a literary man as well as a politician and a member of the legal profession. During his early career he attracted much atten-

tion by his contributions to the *Saturday Review* and by the letters addressed to the *Times* on all manner of public topics, letters signed "Historicus," a title which soon became famous. These letters were afterward collected and published in a volume and were read everywhere. Sir William V. Harcourt proved himself one of the foremost debaters in the House of Commons and held office several times in Liberal Administrations. He was twice Chancellor of the Exchequer and proved himself indeed the most capable and successful holder of that office after the great master of finance, Gladstone. Harcourt was a man of keen observation, shrewd humor and a wit sometimes genial, sometimes sharp and sarcastic, but always genuine and spontaneous. I knew him well during many years, had the good fortune to meet him often in private life and in Parliament, and I look forward with the deepest interest to the completion and publication of the work about to be undertaken by his son. One of Sir William Harcourt's latest conspicuous appearances in Parliament was on the occasion when he introduced the son to the Speaker and the House of Commons on the occasion of his son's election for a Lancashire constituency. The ceremonial had a peculiarly touching effect on all who were present in the House at the time or who read of it in the newspapers afterward. Every one who takes interest in public affairs knew well that Sir William Harcourt had refused to become a candidate for the position of leader of the Liberal Party whenever the General Election should bring a Liberal Government into power. It was therefore clearly understood that Harcourt's active public career had reached its climax and was before long under whatever conditions to come to its close. The fact thus illustrated that the close was marked by this public introduction of the son to a place in that House of Commons which the father was soon to leave gave a touching and melancholy grace to the brief ceremonial. The world did not then know that the death of Sir William Harcourt was so soon to become an event in the history of the English Parliament.

Just as I am about to dispatch this letter I receive the news of what threat-

ens to be the revelation of a great public scandal in one of our Ministerial departments. The report of Sir William Butler's Committee, appointed to deal with the question of sales and refunds to contractors in South Africa during the war, has just been issued and is the one great subject dealt with by the morning news-

papers this day. The readers of THE INDEPENDENT will have the substance of the report before them almost as soon as I have had it, and I shall not discuss it just now. I shall merely say that it seems certain to create one of the greatest sensations this country has had for some time.

LONDON, ENGLAND

John Hay

BY SHELBY M. CULLOM

[As John Hay first began the study of law in Senator Cullom's office in Springfield, Ill., and was taken to Washington by President Lincoln as his private secretary through Senator Cullom's influence and later was appointed by President McKinley Secretary of State at Senator Cullom's solicitation, we are glad to be able to print this tribute from his oldest friend, who, as chairman of the Senate Committee on Foreign Relations, has for the last seven years been brought into the closest relations with him.—EDITOR.]

THE world fully realizes that a power for good, armed with the best weapons and skilled in the noblest and wisest use of them, has passed from among us; while everywhere are others, filled with deeper grief, realizing the loss of a matchless friend.

If we would reach beyond this universal sentiment for something of the man we might reflect upon the result had John Hay died eight years ago instead of taking his place at the head of President McKinley's Cabinet—the result upon some of the most important events in the world's history and so much that is memorable, vital and permanent in the progress of the United States from comparative obscurity to a leader among the nations of the world. Whatever might have been, John Hay was distinctly responsible—very largely responsible—for what is. The magnitude of the man will only appear in the magnitude of his work when it reaches its colossal proportions in the proper perspective of the past, when it is fully appreciated that neither can American history nor the history of the world for the past eight years be written without generous tributes to the acumen, the courage and the profound influence for good of the late Secretary of State.

Better than many, while he lived the force and value of his work was recog-

nized. In diplomacy he created new ideals of honesty, integrity and efficiency, astonishing and reconstructing the world in its methods. It is claiming nothing not fully accorded him to say that at home he has long held a position beside John Quincy Adams, Daniel Webster and Seward, the greatest of our Secretaries of State. Encomiums from abroad have not waited for his death to proclaim him the consummate diplomatist of his day, tho Lansdowne, von Bulow, Delcassé and Lamsdorf are in the field. Parenthetically it is a fact well taken to heart for future reference that while Secretary Hay accomplished such inestimable good for this country and the world in his dealings with other nations, his most strenuous diplomatic struggles were not with able rivals abroad but with the United States Senate, and his bitterest defeats were in efforts that were combatted by that branch of the treaty-making power.

More than any single accomplishment will always remain his silent influence in turning the principles of diplomatic negotiation from methods of duplicity and complexity to simple sincerity and truth. For this the world owes him a debt of gratitude already appreciated and acknowledged in many ways. He not only advocated and practiced, but in his triumphs through it he established the

diplomacy of truth, as some one has aptly called it. No one was ever more patriotically jealous that every right of his country and countrymen should be recognized abroad, but he instructed all his Ministers and impressed upon them the necessity of exercising perfect honesty, truth and fairness in their dealings with foreign nations.

It is suggestively true that his genius for statecraft has gained fuller recognition in the Old World than among his own countrymen. His highest eulogies will come from his greatest contemporaries among the directors of the world's destinies, for they are the best judges of his transcendent qualities. His ability was given not alone to America, but to mankind. Under his administration of the State Department American interests in all parts of the world have been zealously upheld and maintained, but always with that peaceful, conciliatory spirit which strengthened and augmented the friendship of the other Governments

and peoples. His official labors have been prodigious, always elevating the United States. In great questions of world interest, where ten years ago we should hardly have been considered, his far-seeing diplomacy has given us a position to which the nations of the Old World are learning to look for light and guidance. His exalted personal character, conservative spirit and charming personality gave confidence both at home and abroad in the abiding purity of our foreign relations. He exalted the ideal of the public servant. He exalted the standard of his country in its relations with the world and gave tone to its diplomacy that will not be forgotten.

Reflecting on this, we may be glad in

our sorrow that John Hay has lived through these last eight years of critical international intercourse. I appreciate in it all a deep sense of personal gratitude, too, from the fact that when President McKinley was deliberating upon three names for the most important position of Secretary of State, I threw whatever influence I possessed into an earnest appeal to him that John Hay be the man, as I considered him best fitted of any American to fill the place. More than thirty years before I had advocated the

same man with President Lincoln, when he took young Hay, a student in my law office in Springfield, Ill., to be his private secretary and devoted aid in Washington.

Naturally, perhaps on this account my first deep thoughts of sorrow turn farther back than the last eight years, which have simply developed and utilized the might of the man I have known and loved so long. I think of him as a boy, when his uncle, one of the ablest lawyers in the country, was my law part-

JOHN HAY

ner, and he came to study in the office of Hay and Cullom. He may not have appeared a prodigy then, but he certainly was not lacking in the best qualities that make the man. He was more genial than precocious, but that exquisite and invariable courtesy and loyalty which marked every step of his later career were always obvious. I sometimes thought that he paid more attention to people and things than to law, which, after all, is not an unpromising trait even in a young lawyer. He was markedly honest with himself and with others from the very earliest memory I have of him. One felt that it was safe to rely upon him. The two principles of life signally apparent in the success of his later years were equally

his as a boy—the Golden Rule and “Honesty is the best policy.” He was never neglectful of work and doubtless paid better attention to it than appeared through his propensity for doing several things at once and doing them all well. We did not fully appreciate it then, and it seemed to me that the sphere in which he would eventually be at his best was more social than legal, more poetical than political. In those days he wrote a good deal of poetry, only a little of which ever reached the public eye. It might alone have made him famous. It might have been but the first fruits of immortality had not poesy been so completely overshadowed in his own mind with the magnitude of his later work and in the estimate of the world by his magnificent achievements in diplomacy.

These later, inestimable victories, benefiting humanity and elevating America, are so much more in my line of life that I better appreciate their value and his colossal proportions as a leader of men and instigator of great results, national and international. But thinking over that long ago I am tempted to wonder what the result and the victory and the immortality of John Hay might have been and how they might have compared with what they are had he remained in Springfield instead of coming to Washington with President Lincoln; had the rather dull routine of early, unspecialized law in the West failed to satisfy the longing of his great soul and his best and grandest thoughts turned, as they might, to literature and poetry. I confess that at the time of his going to Washington as private secretary to President Lincoln, the man whom above all others I honored and loved, in spite of the troubled times I considered it but a stepping stone in the development of proclivities that were to me most apparent. Instead it proved an open door through which he passed into a wholly different life, destined so thoroughly to obliterate those early tendencies that in later years Mr. Hay became morbidly sensitive to any reference to the poems which alone would have made his name famous in the world. Will posterity indorse him? A touch of Nature making the whole world kin is cherished in the heart where triumphs of statesmanship

are forgotten by the head. The songs of a nation are dearer to it than its hero. Great names go in clusters, but “Jim Bludso” lives alone.

When hardly more than twenty-two Mr. Hay entered upon a course of training such as has been granted to but few and, indeed, which very few could have turned to such profit as did Hay. The inherent qualities and capacities which he possessed fitted him in advance as few were ever fitted to absorb and make the best of the opportunities. His mind blended the practical and poetical in apparently incompatible *rôles*. His imperturbable poise, his alertness, his wit and his unfailing humor were purely American. His mind was a blade of perfectly tempered steel, but it was not fashioned for the hacking and slashing of war. He was, mentally, more sinewy than robust. The virility and fire of man were softened by the finest perceptions of woman. Such a man, cultivated and enriched by constant communion with the greatest minds of the age, could but have become of wonderful breadth of vision and accuracy of foresight. Called at last to a position where every quality had full play, he was ready to meet emergencies.

All the great events of the Civil War passed before him at close range as President Lincoln’s private secretary and friend. In the diplomatic service in the capitals of Europe he learned the intricacies of Old World methods and became a master of French, German and Spanish. He was brought into personal contact with the men who make and mold history and was so much the better able to deal with them when he became head of the State Department. But I have always felt that pre-eminent in his preparation was the five years he served as editorial writer on the *New York Tribune*, where Horace Greeley characterized him as the most brilliant man who had ever entered the office. The education was completed by his service as Ambassador to England, whence he was called to the State Department, equipped for the service as none had ever been before; for even the State Department was not new to him. He had served for eighteen months as Assistant Secretary under Evarts. He

carried to the office as well as experience and training all of the grand characteristics which had marked him from youth. In his diplomacy as well as in personal relations with men he was frank, truthful and loyal. It took some time for the nature^d of his methods to be fully realized in the Old World, but they are understood and appreciated to-day.

A peculiar feature of Mr. Hay's life as Secretary of State has been that most of the time he has stood next in line for the Presidency. From the death of Vice-President Hobart to the inauguration of McKinley and Roosevelt and from the death of President McKinley till the last inauguration the death of the President would have placed him at the head of the nation. One of Mr. Hay's temperament could but keenly dread the possibility of such accidental prominence.

Personally, with all his friends, I mourn the death of Secretary Hay more than any words can express. He was the soul and sentiment of those who knew him well. His home was the one place in Washington where President Roosevelt frequently and informally visited. He often stopped there when returning from church on Sunday. Being a warm friend of the father, he had known the President from boyhood. In private life, to all who knew him, Mr. Hay was the most companionable of men, of wonderful versatility and practical information, but so modest and unassuming as to be within the reach of all. He was a supreme master of English. His conversation overflowed with apt stories, always clean and always vital. He was an apostle of sweetness and light, with a nature as tender and affectionate as a woman's and a man's strong and hearty

approval for that which appealed to him. As a characteristic instance of the man, when "Pickett and His Men" appeared, the great story of the great Confederate, General Pickett; Secretary Hay wrote to the widow of General Pickett, the author of the book:

"I have read your wonderful and beautiful story. I notice that the first chapter of the book begins with the name of my friend, Abraham Lincoln, and that the last chapter of the book begins with Abraham Lincoln. I thank you."

Mr. Hay was sometimes jovial, but oftener, in later years, depressed. Sadness had come into his life, and, besides, there seemed a sense of incompleteness. Full and effective as his life had been, the possibilities in him were so much greater still that the encroachments of age found him feeling that there was much he longed for time to accomplish, which must be left undone. He was right. He had not begun to exhaust his possibilities. Only this fell to his lot which can never fall to the lot of another: as Lincoln's secretary and confidential friend he played his part in the tragedy which welded the States into a nation, and a generation later, when that nation moved from obscurity to be a great world Power among the greatest nations, he stood at the helm and piloted it among the treacherous rocks of international diplomacy. He guided it to a position which is to-day the pride of every true American.

Whatever more it might have been, and however much we mourn and miss him, we know, and all ages to come will know, that his was a grand life well lived and a great work well done.

SPRINGFIELD, ILL.

In Memoriam:—John Hay

BY ETHELBERT D. WARFIELD

"PEACE hath her victories!" and such were
thine

O brave and constant friend of world-wide
peace.

And as to-day we mourn thy sad decease,
And for thy bier a fitting chaplet twine,
We choose no laurels, nor bright bays, to shine,

As oft in earlier years, above thy brow,—

Nor yet the civic oaken crown,—but now
The olive, only, shall thy locks confine.

Perchance it was from that great heart who
bore

The bitterest burdens of fraternal strife
That thou didst learn the paths of peace to
love;

And yet, methinks, thine eyes rose far above

All human forms to Him whose flawless life
Triumphed for peace the while hate's thorns

He wore.

EASTON, PA.

The Odd Money

BY EDEN PHILLPOTTS

AUTHOR OF "CHILDREN OF THE MIST," "THE GOOD RED EARTH," ETC.

I F I don't know the feel of cold rain working to the skin an' slowly killing a man's proper heat of body, who should know it? I can always call home that cruel camp on Watchett Hill, up above Belstone village, under Dartmoor; and when I chance to be in rain them days come back so fresh that I can see my yellow khaki turning mud color again and feel the wet getting home even through my puttees.

'Twas like this: The Seventh Border Regiment had just come back from Africa, so the War Office, in its usual far-thinking and kindly fashion, put us under canvas from the first day of May, and chose Dartmoor—just to brace up our constitutions. A month of rain we had, and the ambulance wagon was up an' down to Okehampton Hospital pretty near every day from the first to the last.

I mind the march to camp as if 'twas yesterday, and, tho a Devonshire man myself, nobody cussed Belstone an' Watchett Hill an' the awful weather worse than me on the day I arrived there; for I'd got a blistered heel and had fallen out five miles from camp. There was not a donkey cart to give a chap a lift, and the rain came down like Noah's own deluge.

The village was in a muck when I limped through it, and the folk had naught but sour glances for us, because they didn't want us, owing to a very unpleasant recollection of a militia camp two years afore, and not understanding the difference between militia and regulars—poor twoads.

Belstone lies under Cosdon Beacon—a fine lump of dirt throwed up east of Taw River—and the village looked to me no more than a smudge of mud and reeking thatch and mildewed walls, under the fog and drizzle. Two decent waterproof houses they had, and only two—one being the church and t'other the "Hearty Welcome" inn.

I often call home that first sight of

Belstone and how I cussed it, little thinking as my fate laid there. Arscott's granite works stretched one side of the green; then come cottages and fields and farms round about. The roads were all rich and running with manure from the farmyards, and they shone, too, with all the colors of the rainbow where the traction engines that had brought up our camp furniture had spilt oil and coal tar in the wet.

A poor, bedraggled scatter of sojers crawled up the hill to camp. The ducks wagging their tails in the gutters weren't dirtier. Never did I see such a place for mud, even in Devonshire.

Up we went through great banks of gorse, that shone gray in the rain, and past hedges still nigh naked, tho the month was May. And then, before you come to the Belstone tors, in the eye of the west wind, without a stick of cover, the camp lay—drowned.

Dartmoor towered all around us, and every ten yards a stream 'peared to pour out of the heath and go splashing down to the rivers in the valley. The rain swept us, and the wind howled like a sky full of wolves. We all tried to be cheerful, but that night the officers' mess tent was half blowed down at dinner, and a few of 'em got their mess clothes spoiled, owing to the lamps coming on top of them; and a lot of lively things was said about it as might have interested the army authorities if they'd but got to hear about 'em.

Doctor ordered four chaps into the ambulance next morning, with their breathing works wrong. We envied the beggars. Talk about cold! To look out 'pon that place in the first iron-gray of dawn and see naught but fog-banks and soaking grass and naked rocks, and hear naught but water running and carrion crows croaking up aloft, and feel naught but the raw air gnawing at you like a dog! But, if you'll believe it, the officers made nothing of it. They had

their tubs outside their tents just as if it was the middle of summer. It seemed to please 'em there was such a lot of water. No doubt 'twas the great contrast after Africa.

The weather went from bad to worse, and our maneuvers were chiefly confined to trying how we could keep dry. We had a field day or two and done some good work. And Belstone took very fairly kind to us when it knowed us, especially the people at the public house. Only a man, by the name of Reynold Chastey, he didn't like us, because some Tommies robbed his hen-roost one night. 'Twas a tar-pitched shed on the hill and a few blackguards—I knowed their names very well—took a lot of eggs and a bird or two on their way back to camp after leave. They traced the eggshells, but no more.

Now I must tell you that I knowed Reynold Chastey's son. He'd falled at Paardeberg, and by chance him and me had worked there side by side for a week. We was both Devonshire men, you see, and got telling together. So, finding myself here—alongside the man's parents—I thought 'twould brighten 'em up a bit if I went and told 'em about their son and how he lost his life.

Of course they was very pleased to see me and made me welcome. I spent a good few hours to Chastey's farm, and Mary Chastey, the missis, took a lot o' tearful pleasure in hearing me tell; an' the master would listen, too; but he was a hard piece o' goods and never showed by look or sigh what he thought about it. Once, when I'd known 'em a week, I made bold to ask Henny Chastey, their darter, how 'twas he took the tragedy so easy; and she told me as her brother had gone for a soldier without his father's leave, and flinged over farming and broken loose.

"There's only me, now," she said. "They never had but us two, and 'tis my father's great grief in life that our place will go into other hands come he dies."

"Pike's" was the name of Chastey's farm—just "Pike's" an' no more. 'Twas a gert, rambling, two-storied house in the dip between Cosdon and the Belstone Tors. It stood a few furlongs from the river and had a nice bit of tilth around it, and beautiful common

land alongside, over which Chastey had grazing rights, like the rest of Belstone.

He did a lot of cattle-rearing and had good luck at it. A very upright, honest, hard man, church warden for the people.

I done what I could to pay them for their kindness to me, which was great, and the number of times I told poor Mrs. Chastey about her son's grave, and how it faced, and who were his neighbors underground, and what sort of a mound they'd made, and so on, you'd scarcely believe. But 'twas here that I falled in love for the first time in my life; and, of course, a man in love with a woman makes light of any trouble the parents may give him.

Henny was neither tall nor short, if you understand me. A very beautiful round shape she had, as first took my fancy in these flat days, for I do love a woman to *be* a woman, and not a pin-tail creature as ban't flesh, fowl or good red herring—like so many females nowadays. You could see she was a gal a mile off, and her voice was gentle as a bird, and her little hand was as cool and soft as butter, and her eyes were pale blue. Hair thick and brown; face beautifully round; teeth perfect, all but one dog-tooth as had got knocked out by a swinging gate when she was twelve year old. Her little feet was mere mice seen alongside mine. She was twenty then and I was twenty-four and had two stripes. Not that I liked the army. Being bred down Newton Abbot way and the son of a farm laborer, I'd had enough of soldiering long ago and much wanted to be back on the land. What I best liked was gamekeeper's work, and I knew a bit about it, having been rather a successful poacher in my youth. In fact, to be plain, 'twas a misunderstanding with some folk to Bradley Woods, nigh Newton, that first made me go as a soldier. Old General Hext had me up afore him over a plain question of partridges; and two other men on the bench, being of the same mind as him, it was proposed to me that I should enlist so as to settle the matter in a satisfactory manner. And so I did do, being very much at a loose end at the time.

But now I'd had enough and got a medal, and seen life and death, and knowed what the world was. Then at

this critical stage Miss Henny comed into my acquaintance. And no doubt little would have happened from it if she'd not been of the same mind, but she was, and when I offered myself one Sunday afternoon while we were taking a walk down along in Halstock Glen, if she didn't up and say "Yes!" Then us got kissing, and I felt almost frightened to see how deadly in earnest the maiden was. For I didn't take the girls so very serious in them days.

The camp was going to be struck two days afterward, so I had no time to lose; and, as it happened, that very night I seed Mr. Reynold Chastey and told him how much his darter and me wanted to keep company.

He didn't waste words about it, I will allow.

"'Tis out of the question, Jonathan Pierce," says he. "'Tis impossible. Henny will be mistress here come presently, and she must have a man as I can have under my own eye, and a man given to the land, and an understanding man equal to earning good money," he says. "A soldier's no use to Henny, nor yet to me," he says. "You'm a great hero, an' a good chap, I doubt not; but us don't pay our heroes enough to make 'em very inviting to the father of a darter. So there's an end of that, if you please."

However, I wasn't be to choked off at a word.

"As for soldiering, master," I said, "it don't come no pleasanter to me than you. I'm tired of it and I'm going out of it so soon as ever my time expires. I want to be back on the land, and I'm good for a pound a week or more to any man. And I know a bit, for that matter, having been born and bred down country at Newton Abbot."

He listened very patiently, but I could see he wasn't going to change his mind.

"You talk in an easy way about a pound a week. But even that takes earning. Time enough to go on with this when you be making the money and can look ahead for a rise."

Then Henny, as was listening to the talk with a good deal of interest, cut in:

"Where's the young man of twenty-four year old be earning better money?" she asked. "There's only Ted Adams, and, tho he says he's twenty-three, many

believe he'm ten years more. Them foxy-colored chaps might be any age. And, for that matter, the man's too busy with all the things he undertakes."

Now, Ted Adams was a very queer, pink-eyed, rabbit-faced, young fellow that old Chastey thought the world of. He read the lessons to church, and kept bees, and was postman to Belstone, and a few other things, including thatcher; but Henny couldn't abide him, and so her father's ideas in that matter seemed unlikely to come to anything.

"We love one another, I'm sure," I said, "an' perfect love casteth out fear, as parson told us last Sunday."

This was my artfulness to show I'd been to church. Then I went on:

"Give me a chance, master. I don't ax you for work, but I do say that I'm not talking off book. I've saved a little bit of money. I'm well thought of and I do believe that Captain Wigram will be so good as his word and get me a job when I leave the army. If I make fifty pounds in a year, will you think better of it?"

"Say twenty-one shillings a week," he said, relenting, to my surprise.

"So I will then; and first year's wages you shall have for Miss Henny to put in the bank."

"Make the money and come to me at the end of a year with it; then us can see how the land lies and the future looks," he says.

Well, Henny rejoiced and I took him.

It seemed to me that such money ought to be in reach of any tidy chap with brains in his head and experience behind him. Besides, there was Captain Wigram. By chance I'd done this gentleman a bit of a good turn at the front. There was talk of a V. C. for the job; but many earn that as don't see it, and the luck wasn't with me there. Yet 'twas a rich young man's life I'd saved, and he valued it, and he'd always said I was to go to him in case I wanted anything in the time to come.

So there it stood, and to cut a story short, in two months after my talk with Reynold Chastey I'd left the army and got work as under-keeper at two-and-twenty shillings a week. I liked the business well enough, but only meant to keep the job till I could get a better at farm-

ing. Then, on the quiet, I bought a book about agricultural affairs and read up a lot of learned stuff touching steam power for the land, and chemical manures, and rotation of crops—all to astonish Chastey. But the best luck is yet to tell, for the billet I got was with General Sir George Luxmoore, an old gunner, and a chap who was Squire of Okehampton, and a sportsman to the sole of his foot. No man ever had a better or kinder master, and 'twasn't his fault, nor yet mine, that we fell out at the most critical minute in my life.

You see 'twas like this: Chastey and me understood each other, and tho I can't say he ever took really kind to me, he respected me, especially when he heard about the chemical manures. He'd made up his mind to let me have Henny if I kept my word; yet he didn't want me to have her, because he'd always got a liking for young Ted Adams. He was no judge of character, you understand; but, be that as it may, it comed to be a clear bargain that if I could show vouchers for fifty-two guineas in the bank on the day year that I went into Sir George's service I was to be engaged to Henny afore the face of all men.

But so soon as Ted Adams heard tell about this he caballed against me, and, what I thought was a blessing—namely, having got work so near to Henny—turned out to be just the other thing. Because Adams had an uncle on his father's side, and that uncle was head keeper at the General's—a place called Okehampton Court, with wonderful woods lying for miles along the River Oke. This here man, who was called Saul Adams, understood all about the affair presently, and for reasons best knowed to himself he set to work against me and took sides with his nephew; and I jolly soon found that I'd got a bad enemy in him. Blood's thicker than water, no doubt; and 'tis also thicker than honesty sometimes, for you'll often see them in power doing a dirty trick and offering to their kin what justice would give to a better man.

Of course, 'twas easy for Saul Adams to queer my pitch. He went about it very cunning, too. First he complained against me to the men servants; then he lodged a complaint with his master,

and I was had up suddenly without warning. But I proved the trouble weren't none of my making, and cleared myself easily. Then, three months later there was another row, and it got to be a question between my word and the head keeper's. He was an old soldier-servant of the master's and had seen service with him. And Saul's character being very good, they believed him against me, and I got a flea in my ear and a warning to behave mighty careful in future.

The injustice burnt in me, and for two pins I'd have broken that bad old man's head; but I couldn't risk a quarrel. There was three months more to go to the year, and tho I'd tried very hard round about, I couldn't get another job at that money or near it. 'Twas a terrible time, and, of course, the old man won. I needn't go over all the ins and outs of it; but in the end Saul Adams had me up afore the master and laid a charge of poaching. Right well he done it, too.

He said as he'd long feared, it was so, because once a poacher always a poacher. This he said because, like a d— fool, when first I went to Okehampton Court I told the man of my wild young days, and now he brought the matter up against me. Then he turned to his nephew, Ted Adams, and Ted testified against me how that, to please his uncle, he'd watched for three nights running in the coverts, and how with his own eyes he'd seen me kill birds.

I fought so well as I could, but 'twas the last straw that breaks the camel's back. Sir George was very sorry and he seed a bit how the land lay, because in my defense I told him all about Henny Chastey, and how Ted Adams was after her so well as me. He didn't believe all the yarn, yet, taking one thing with another, he reckoned him and me had better part.

"I shan't prosecute," he said, "but you must go, Pierce. A character you need not ask for. It is enough that I dismiss you because you don't suit me."

Ted Adams was just wild. He thought I'd be locked up for a certainty, and fail of my undertaking with Henny's father. In fact, it came out afterward that Reynold Chastey had promised him he should be allowed to keep company

with his daughter if I didn't carry out my bargain. When I got the sack, of course, everybody was against me—except Henny. She seed me on the quiet once and I found her heart in the right place. Thanks to her I kept my hands off Ted, but badly I wanted to take forty shillings or a month out of the pink-eyed cur. And that tho there wasn't many shillings to spare just then.

"You've got to come to faither in three weeks with the money," said Henny. "Then naught can be said, and these lies don't signify one way or t'other."

So that was the puzzle. I wanted five pound yet, and I had a matter of over a month to get it in. I lodged with a laborer outside Belstone village, and now I wore out two pairs o' boots looking for work. But everything turned against me, until I grew desperate and did a terrible shocking thing, no doubt. The money had to be got, you see, or else 'twas "good-by" to Henny forever more. So in a dark, savage moment, after a pint or two, I says to myself, "They turned me off for taking pheasants. All right. Then I'll take 'em!"

Nobody knowed better than me what a shameful job 'twas; and nobody knowed better than me how to do it. A wicked and a desperate man was I, no doubt. But once I gived my mind to the matter and looked round for a market, all the rest came so easy as lying. I'd got to gather up best part of five pounds, and I took it out of Okehampton Court spinneys, for I knowed to a tree where the birds was by night and to a blanket where old Adams was. With a little air-gun, what I picked up cheap at a blacksmith's in Hatherleigh, I had no trouble whatsoever; and as for old Saul, he shirked his work shameful after dark—always did so, as I very well knew.

But mine was honest dishonesty, as you'll see. I got the money together in good time. Then, on a Sunday, I marched up to "Pike's" and walked afore all the Chasteys, where they sat in the parlor after dinner. A day it was in late November. Reynold sat dozing with his feet to the fire; his wife was looking at the picture of her son who died in Africa. She had a photograph of him, took at Woolwich, and 'twas her

delight of a Sunday afternoon to go to sleep over it. And my Henny sat at the harmonium and played very beautifully all the hymns as she'd heard to church in the morning.

Seeing me, farmer wakes up quick.

"What do you want here?" he says, getting very red about the chops.

"I want your darter," I says.

"Like your impudence," he says; "you—a chap turned off from Squire's for poaching!"

"That's neither here nor there, Mr. Chastey," I answers him. "A bargain's a bargain, an' nobody knows that better than you. I've got fifty-four pound and twelve shilling in this here pocketbook. That's the figure, and there's the money for Miss Henny. What follows you know. I ask your leave to keep company with her from to-day until we'm married."

"Where be you working now?" he asked, and my answer very much astonished him.

"Nowhere for the minute," I said; "but after to-morrow I shall be working to klink."

"'Klink!'" he says. "What be talking about, Jonathan Pierce?"

"I've earned six weeks," I answered. "'Tis a pity, but I couldn't get work worth naming, do what I would and seek where I would. Only ten bob a week have I scored up of late; and that weren't enough, so I had to—to borrow the rest."

"You've been stealin'!" he cried out. "That ends the matter. You hook it from here quick, else I'll set policemen upon 'e!"

"That won't do for me," I answered. "Best to listen afore you make such a noise. I was short of three pound and over, and I didn't see no other way to raise it, do what I would. So I borrowed some of Sir George's pheasants. I owe him three pound, three and ninepence, to be exact, and I've got all the particulars for him. I shall get six weeks without a doubt, and I shall pay him back his money to the last penny in course of time."

Reynold Chastey said he was d—if ever he'd heard such a disgraceful tale; and I admitted 't was a shocking job, but none the less I held him to his bargain. Then he forgot hissself and the

day, and cussed most furious, and rose up and grabbed his hat and went straight off over the common to Belstone for a policeman.

After he'd gone the air growed a thought cooler and Henny had her say. Then it was that I understood for the first time the sort of girl I'd got.

"You bide here a minute," she said, "while I put on my hat; then us'll go off."

"Go off! Where to?" cried out her mother, beginning to shake and shiver.

"To Sir George Luxmoore," she says. "There's a very easy way out of this here fix. No call to cry, mother. I'll be back after tea."

"Mend your crooked life, Jonathan, afore 'tis too late!" said Mrs. Chastey to me. "'Twas a bitter day for you when you left the army. Better far—better far as you'd falled in Africa along with my blessed boy, afore you lent your hand to this. Then you'd be in Heaven with my son this minute."

"I'd sooner be on earth with your darter," I said.

So me and Henny set off, and we went up along over the hill, and down along by Halstock Glen, because it wasn't the right minute to meet her father and agg him into a rage, as we should have done if we'd gone through Belstone.

Tramping along I told her the whole tale, and she jumped to it in a twinkling. Then us went to the cottage, where I was lodging, and I got the tickets for the pheasants; and then she told me how she'd broken into her money box while she was upstairs getting her hat, and how she had three pound three shilling and ninepence in her pocket that very moment for General Luxmoore.

She axed to see Sir George, and the old gentleman made no objection at all. And there he was in his study, sitting dozing afore the fire—just like Reynold Chastey had been; because lord or tinker be often equally hard put to for something to do of a Sunday afternoon.

Henny told the story from the beginning—from the moment the Seventh Borders pitched their camp 'pon Watchett Hill to the time I got the sack from Okehampton Court. Then she explained the bargain I'd made with her

father, and how Ted Adams and his uncle had plotted against me to ruin me, so as Ted might be taken on and have her instead of me. Then she comed to the odd money, and how I'd earned it, and with that she put down the cash on the table alongside my account of the birds and the money I'd got for 'em. She also told Sir George that I was ready to go to prison immediately; and I said so too.

Certainly the General seemed very much interested in the tale. He quite woke up—just the same as Reynold Chastey had done; but he took it in a loftier spirit, of course, tho they were his own pheasants.

He said that he should make inquiries and he ordered me to give myself up on the Wednesday following at twelve o'clock. I said:

"At the police station or here, your honor?"

And he said:

"Here."

I promised to do so and we went out.

Then Henny spoke to me afore she marched home.

"Come what may," she said, "I'll keep my word to you, Jonathan. You done this for me, and naught but the wickedness of them two men lost you your job and drove you into poaching. I'll tell dear father this night that if you get six weeks, or six years, 'tis all one. I'll keep company with you so soon as you'm free to keep company with me; and when you can marry me, I'm ready, if 'tis fifty year first."

That's the sort Henny Chastey was.

The upshot will surprise you, for Sir George—a Christian soul to the marrow in his bones, and one as had not forgot his love-time neither, tho now up seventy years—Sir George, he forgived me, seeing the sidelights on the case.

He'd made his inquiries and heard no good of Ted Adams from anybody except the parson at Belstone. But parson, you see, judged the man by his power of reading the lessons and not by his skill at acting up to 'em.

Thanks to luck, I found work a week later; and then came my bit of real good fortune, for six months after that the bailiff to Mr. Eve's died, and I got the job temporary at five-and-twenty shill-

ing a week, and ended by keeping it altogether.

The rest you can guess for yourself. Of course, Reynold Chastey had to come round, which he did do, reluctantly; and 'tis just a year ago now since me and my girl was married. We live in a cottage on Mr. Eve's farm, and presently, when Henny's father gets a bit fonder

of the fireside, we'll be at "Pike's," no doubt.

But I hope not yet awhile, for 'tis always well to have half a county between yourself and the best of relations when it can be done. A good stretch o' land between softens the judgment and makes for charity.

ELTHAM, TORQUAY, ENGLAND.

Herculaneum

BY RICHARD NORTON

DIRECTOR OF THE AMERICAN SCHOOL OF CLASSICAL STUDIES AT ROME

THE interest that has been aroused during the past year by the suggestion of Professor Waldstein, of Cambridge, England, that an international committee be organized for arranging the exploration of Herculaneum has been widespread. In some quarters the idea was enthusiastically received, but in general the scholars best fitted to judge the value of the scheme have not thought well of it. The questions involved are not such as can be well answered by society people gathered in some friend's house to listen to an afternoon lecture, or by enthusiastic students of art hampered by a more or less accurate idea of the contents of the Naples museum. The chief points to consider are the engineering problems connected with the proposed excavation and the expense involved, and then the character of the works of art that may be found. No mere archeologist is fit to decide on the engineering question, but that the expense would be very large is indubitable, for the ancient city lies immediately under a suburb of Naples, the flourishing town of Resina. The expropriation of the land here, the carting and dumping of the refuse and finally the digging out of the deeply buried remains would foot up to a very large sum indeed. For the sake of comparison it is well to remember that the expropriation of the village of Delphi, a dirty, squalid little hill town with no business, cost, I believe, \$60,000, and the exploration of the Basilica Aemilia in the

Roman Forum has cost some \$40,000.

The archeologist's opinion, however, is important and necessary in estimating the character and value of the works likely to be found on the site. The exceptional results of the excavations carried out one hundred and fifty years ago, which provided most of the important bronzes in the Naples museum and a very large number of papyri, has thrown a glamour over the name of Herculaneum which very probably will not be justified by future excavation and which has led to many exaggerated statements getting into print.* It is frequently claimed that Herculaneum was at the time of its destruction by Vesuvius, in 79 A. D., a Greek settlement, and hence will be certain to provide beautiful works of art. This is a charming theory, but besides the fact that many a pure Greek town has given us very little in the way of art there is, as a matter of fact, no proof at all that Herculaneum ever was a Greek settlement. At first it was an Oscan town, later the Etruscans held it, and then the Samnites. Finally the Romans took it, about 290 B. C. The town is rarely mentioned in ancient literature; Martial sings of its wine and Pliny speaks of its natural charm; it was not a trading center like Pompeii,

* As for instance, in Mr. Sturges's article in *Scribner's Magazine* for April, p. 509. He says: "What is there in the way of bronze sculptures in all the museum world of Europe to set against these of Herculaneum? Of life size busts and statues there are not enough outside of the Naples collection to fill a small room." This is a misleading exaggeration.

but a favorite resort of rich Italians to pass their *villegiatura*.

The first recorded excavations were in 1709, but in 1711 the Neapolitan Government stopped the work, which was begun⁴ once more under Government supervision in 1738 and carried on intermittently for thirty years. Of the parts excavated only the theater has been left open. Two other campaigns, from 1827 to 1837 and from 1869 to 1875, complete the list of excavations on the site.

The construction of the buildings that were laid bare shows that the town as it existed when the eruption of Vesuvius took place was not an old one. Here and there in all the buildings were found statues and marble decorations, such as columns and fountains, but practically all the statues and busts that make Herculaneum famous come from one villa, called from the papyrus manuscripts found there the Villa of the Papyri, or, from its supposed owner, the Villa of Piso.

In estimating the value of the works found here one point must be clearly borne in mind: It is that while some of the bronzes are unquestionably original works by artists contemporary with the age of the house, and some are much earlier, others are in all probability merely ancient reproductions of works that pleased the owners' fancy and bear the same relation to the lost original that a copy made to-day of the Delphi

Charioteer or Cellini's Perseus would have. These are not original works.

The library is, so far as the rolls of papyrus have been unfolded and deciphered, disappointing, for the works are in the main by later and largely valueless philosophers.

This villa was without doubt an uncommonly rich one, but does it give any reason for supposing other villas still to be discovered there would be equally profitable to excavate? I think not. The public buildings, such as the theater and basilica, and the other houses that were cleared by the various diggers, showed no great luxury of decoration, nothing to imply that the people of Herculaneum as a whole cared in any special way for the fine arts. Furthermore, no one thinks of estimating the interest of all the houses in Pompeii by the standard offered by the House of the Vettii, or of all the country villas in the neighborhood by the famous one at Boseo Reale. Many other interesting things would doubtless be found, but there are many other sites where equally valuable results can be obtained at far less cost, and whether the work is done or not there is no call for the clumsy method of an international committee. It will be a good thing when Italy adopts a more intelligent attitude toward excavation undertaken by foreigners, but for the special work at Herculaneum she has men and means enough if it seems worth while to undertake it.

ROME, ITALY.

John Paul Jones

' SURRENDER? I HAVE ONLY BEGUN TO FIGHT '

BY C. ELLIS STEVENS

OLD viking of old strife,
Whose wave-tossed life
With stress and storm was rife—
Fresh blows the gale
Across a far-swept sea.
Set sail! Set sail
After one hundred years
Of conflict void of fears—
In which the Ship of State
Has faced its fate
And dauntless held for triumphs still to be.

The battle thou hast won
Is but begun—

The half-fought fight for freedom and the right.
Out from the dark of night
A new day lifts its sun;
And man wields more of might,
And stands for nobler deeds not yet full done.

Hail, son of the salt main!
Ho, for thy latest cruise! For, tho so late,
We, not ingrate,
Give deathless gage how we remember thee.
A people grown a nation call thy name,
Long on their roll of fame,
And bid the free winds waft thee home again.
BROOKLYN, N. Y.

With the Bees in July

BY E. P. POWELL

AUTHOR OF "OLD FARM DAYS," "THE COUNTRY HOME," ETC.

ONE of the most wonderful things in the world is the bee, and the most remarkable bee is the common honey bee. When Nature finds that there is a lack of touch between important affairs that should co-operate she knows just how to bring about an adjustment. In our orchards it was necessary to keep some things, and very good things at that, from over-fruiting. There are two drifts going on everywhere: one of these is the old wild drift simply to multiply, and the other is the tendency to sacrifice fecundity to quality. In this sacrifice of fecundity some of the very noblest of our fruits were left without ability to produce any fruit at all. For instance, the Brighton grape will not bear a perfect bunch, and very few bunches at all, without pollen from some other grape. The wind is unable to do this work perfectly, but the bee just fits in the gap. Covered all over with fuzz, he goes for his honey, crawling in among the anthers, until he is covered with pollen. Then, pushing his way among the anthers of other flowers, he mixes the pollen, and he does it more perfectly

than any other conceivable agency. The farmer and country home-maker should keep a few hives of bees for this purpose alone—to pollenize his fruit. If he does not he runs a sharp risk of going without Anjou pears, some of the choicest grapes and even some of his noblest apples.

Country people should invariably keep bees also as an economic method of securing a family supply of concentrated and delicious food. I am able to take from about twenty hives five hundred to six hundred pounds per year. After selling about fifty dollars' worth per annum we have still all that a large family can consume—and we use it very freely. I would keep bees also for the fun of it and for what they can teach us. It is not simply the "little busy bee" whose industry we have to admire, but a social state, worked out somewhere in the past, and with some questions of political economy solved, where man remains a mere kindergartner.

To be understood honey must be tried with various dishes, altho I am satisfied it is never better than on light buckwheat cakes. My wife was one of those who

accompanied Professor Riley when he experimented with honey and locusts during the terrible locust plague of Kansas and Colorado. The locusts were roasted and then served up with honey, all agreeing that they made a very palatable food. Our prejudices gradually wear away about such things, and the time will probably come for utilizing as food a great many things that are now abhorred. It was a compulsory lesson at that time, for the grasshoppers left little else to eat. At least half of our present dietary has been somewhere, at some time, under the ban: pork, potatoes, tomatoes, mushrooms, oysters—even beans. I like honey on meat, as I eat lemon on my oysters and macaroni. One authority says that gingerbread made with honey is delightful and that the honey makes it light and spongy. I believe that housekeepers consider that honey goes a long way toward making hot biscuit digestible. I hope so. Then we have a long list of delicious drinks which owe their best qualities to honey. An old "Meade Song" tells us of

"The foaming, pure, and shining liquor
Which the bees provide but do not enjoy."

An old recipe reads: "One pint of honey to four of water, flavored with various herbs and spices, and when cold add a little yeast of beer. Wall flowers and strawberry leaves are used by some, as also violets, marigolds, orange and lemon peels. Others add Roman wormwood and thyme." Cowslip mead was made of honey, lemons, a handful of sweet briar and seven pecks of cowslip tips.

The art of beekeeping has greatly advanced of late. I remember sixty years ago burning the last of our old straw hives on our "sparrow grass bed." It was held to be a good thing to rake up all the old rubbish and burn a bonfire over asparagus every spring. Now there is not one left of those beautiful pyramids of straw, while our bees are kept in patent hives. I doubt if one of my readers has ever seen a straw hive. The bees liked them, however, and lived in them very comfortably. Our present day hive is a good deal more scientific than our own houses are. It provides for maximum results with minimum labor, gives good ventilation and is warm in winter. The honey box is a great invention, for

in old times the bees were left to hang their honey combs on the hive itself—only that sticks were run through to help them. There was no provision for separating what was called hive honey from white honey. A little later a simple box hive was used, with small boxes on top and a hole through for communication. The bees stored their finer honeys in the top boxes.

I look down from my window over my bee republic and know for a certainty that affairs there are as much involved as in our household state, but much more orderly, more unselfish, with less of crime, less of meanness—above all, ignorance and laziness and fraud—than in the most ideal human family, with its Ten Commandments and Golden Rule. These little peoples have reached the ideal of co-operation. They have exalted work to hold the highest place of honor. There is no drone tolerated beyond his specific value, for when no longer needed he is promptly put to death.

But you are very much mistaken if you think the queen is supreme mistress in the hive. She is absolutely submissive and obedient to the general welfare of the masses. The worker is the real lord, but the workers know that order cannot be had without love, and obedience to law and reverence for the mother. It is a curious political economy. The queen deliberately murders every young queen that she can. When the workers desire to raise a new queen they are compelled to defend it continuously. When swarming draws nigh it is the old mother who goes out with the colony, while a young queen is raised to the dignity of mother of the hive.

Where did the bee nation do all this thinking and evolution? They do very little that is new or novel. They do not think much; only act. They all do the same things, and all do them alike. Their social life is superbly arranged, yet it is completed. They hold no legislatures for making new laws nor do any parliaments cover bee life with a litter of annual statutes. No Gladstones or Bismarcks are generated, nor would even a John Bright be tolerated. I imagine that a Roosevelt would be made short work of. Progress is not desired. What place is there in bee life for

a Republican party with its tariff or a Democratic party to advocate free trade? Bees have no objection to taking possession of the Philippines, but they would immediately set up housekeeping, without interfering with local rights. Can you imagine a bee hustling for votes to get the office of town constable or county supervisor? I have heard of a man who had "a Presidential bee in his bonnet," but I have never heard any buzzing to that purpose in my hives.

Of all bee foods there is nothing to surpass that secured from linden or basswood flowers. These superb trees are as beautiful for shade as any tree in our American flora, but in their capacity for yielding a vast amount of honey they are unique. It would pay any town to replace a lot of maples, which are mostly diseased, with basswoods. The latter is a healthy tree, easily healing over wounds, and has few enemies. I was surprised, however, in 1903 to find the pear psylla as fond of the basswood as of the pear, and it worked great mischief to both. Apart from this I have only known the basswood to be injured by the forest worm and occasionally canker worms. I have secured the planting of one hundred of these trees in Clinton and shall get in another hundred as soon as possible. They are not simply shade trees, but town property. The bees will make thousands of pounds of honey along the street side. There is no reason why every foot of our highways should not be utilized in some such way. Every farmer should also have a bee grove of lindens or at least have a few of these trees about his house and barn. They make a good windbreak as well, especially with mountain ashes planted between. This latter is also a good bee tree, besides being loaded with bird food. There is nothing the robins like better than mountain ash berries.

Mints of all sorts, catnip, spearmint, horsemint, all give good crops of honey—altho they flavor it if largely used, but not disagreeably to most people. Our raspberries, where there are large fields of them, constitute a splendid bee garden. The honey made from this flower is excellent. But the most curious honey field that I have ever known is the honey dew of the aphidæ (including the related

psylla). From the pear psylla in 1903 the bees secured a great weight of honey, so that the invasion of this pest was not without alleviation. The pears and thorns and linden leaves were covered with sweet exudation from these insects, and the bees covered the trees from dawn till dark. Their buzzing all day was like that of swarming time and sometimes could be heard late into the night. Meanwhile the white-faced hornet was busy eating the young insects. Dandelion honey is greatly increasing of late, at least when other food is not abundant, but it is bitter. Some years the bees give us a large proportion of a strongly flavored and dark colored honey that is coarse and unmarketable. Very little honey is made from clover.

Where the stock of food is short bees do not hesitate to break the community law and rob their neighbors. This is generally the work of a strong swarm clearing out a weak one. The bees are attacked with astounding ferocity, and after they are all killed the contents of the hive are rapidly transferred by the conquerors. The sting of the bee is at this time unusually poisonous. I have heard it said that anger and ugliness make even the bite of a human being poisonous. Robbing is, however, a rare thing in a well ordered apiary. I have not had a case of it in twenty years. Weak swarms are doubled up, and when insufficient food has been stored we provide it until the bees can gather for themselves.

Honey is stored nowadays in pound boxes, that are set in "supers," which hold thirty-six boxes. These should be taken from the hive as fast as they are filled and new supers should be provided at once. Nothing should be done to disturb the continuous economies of the hive. A good strong colony will fill the supers twice in a season, or more. In the Mississippi Valley some apiarists move their swarms up the river as the season advances, keeping pace with the opening of honey-giving flowers.

The most characteristic habit of bees is going home before a storm. If a shower be approaching they hurry-scurry through the air, often only just over your head, sometimes striking trees or running into each other. I can never see

them in one of these races without a notion that they are getting considerable fun out of it. All animals, especially all insects, are very sensitive to atmospheric changes. They feel a storm quite a bit ahead of its striking them, generally a good deal quicker than we are conscious of its approach. Yet out they come again, at the least chance, and gather between showers. In this way they pollinize near-by trees and vines, even when May is exceedingly rainy.

Bee enemies are numerous and will destroy an apiary without watchful care on the part of the owner. Kingbirds will often spend considerable time darting through the busy workers, at each flight snapping up one or more of the bees. Burroughs thinks they take only the drones, which I am sure is not quite correct. A little mouse, too pretty a creature to be so mischievous, gets into the hives and makes sad havoc. The bee moth is most destructive of all, often entirely destroying bees and honey. A shiftless beekeeper is an impossibility, simply because his hives will be destroyed under his nose. The hive should always be set up a little way from the ground and a passage underneath be free for the house cat. (During the summer "Boxer" sits on top of the hives, frequently peeping down over the edges, and laying his hands very heavily on any intruder that shows himself.)

Home seeking is always beset with trials quite as much for bees as for human beings. The process has made it possible for us to secure new swarms. I do not know what we should do if the bees started directly from the hives for their prepared home. This is often miles away, in a hollow tree, or whatever other secret resort they have been able to find. Fortunately they hang out on a limb of some adjacent bush or tree while the queen can collect her forces and move off orderly. This swarming lasts for from one to three or four hours. One day while picking currants a swarm from somewhere suddenly lit on a bush near my head. I was at first afraid they were about to select my head itself. Something had happened in their flight which disturbed the queen. We gave them a good hive and they stayed with us cheerfully. A small swarm escaped

us, and, nearly two months later, I found them in a neighbor's orchard. It was clear in this case that they had not provided a home ahead of swarming. They had fastened themselves as well as possible to a limb of a pear tree, then had gone to work and hung a good many combs of wax to the limb. In this wax there was a small amount of honey. I did not find them until hard frosts and heavy winds had nearly ended their venture. What will be the plight of bees as bee trees decrease? The woods are already so cut away that many swarms cannot get hollow trees. They are betaking themselves to hollow places in our roofs and even getting into rock piles. A neighbor had a veranda roof populated between the ceilings. Bees positively refuse to remain in a dirty hive. They hate bad smelling folk and will drive some people out of their neighborhood.

It was a puzzle for Puritans to know what to do with a swarm that came out on Sunday. Most of them concluded that God directed the bees and that no harm could be done in hiving them. In this they did not hold to the same line of conduct as they did in the hay field, for their horses and cows ate many a ton of moldy fodder that might have been sweetly cured by Sunday labor. It was my father's habit to go to church invariably, but he took care to have his pew on that side of the church where by looking out of the window he could see his house, a mile away. If the bees swarmed a white blanket was hung out of a window over the red clapboards. As soon as he could leave the church he hastened home and made sure of his property.

Nowadays we often let late swarms go, especially if the branch is high up where they have settled. The old folk lore used to say:

"A swarm in May
Is worth a load of hay;
A swarm in June
Is worth a silver spoon;
A swarm in July
Is not worth a fly."

There is a good deal of truth in this, altho the late swarms may be doubled up and so made stronger. When I was a boy I remember that the mother of the

household was expected to keep a very close watch of the bees. If a swarm came out while the men folk were in some distant hay field she frequently undertook the hiving herself. This occasionally resulted in some unpleasant experiences, but it was a poor housewife that would let a swarm escape. If she could not reach it, and it began its flight for the woods, she followed with a terrible din on a milk pan. This was supposed to prevent the bees from hearing the orders of the queen and so compel them to settle on some tree. I am myself very fond of seeing other people hive a swarm.

The belief was formerly universal that bees would not long survive the death of their master. There was some basis for the legend, for the relation is very close between a good beekeeper and his little allies. They certainly tenderly regard him, for I have seen my father carry a swarm to a neighbor's home while it crawled all over his arm and up onto his neck. When he reached his destina-

tion he laughingly but gently brushed the bees into a hive. I never knew him to be stung but once, and that was when the bee got pinched. After his death the hundred hives rapidly dwindled. Whittier sings of the closely associated custom of draping beehives with crape: "Stay at home, pretty bees, fly not hence! Mistress May is dead and gone."

I confess that I was led to write this article by being ingloriously chased across my garden and clear around my house by one bee. It left me, as I darted through the door, with a Togo song. I never can tell that bee again if I see him a dozen times. I have only one consolation, that he could do the same for any of my readers, and I can write an article about him. It was not worse than some other interviews when the other fellow would tell the story. Always pinch a stung place and immediately rub it hard with wet soil. Still the honey bee is a problem. Diplomacy with him is better than fighting.

The Scandinavian Conflict

BY BJÖRNSTJERNE BJÖRNSON

[We are very glad to be able to give our readers this week the following article by the great Norwegian playwright and statesman on the Scandinavian conflict. Björnson has been the acknowledged Norwegian leader in Scandinavian affairs for many years.—EDITOR.]

IT is possible that the way in which the Norwegians put an end to the union with Sweden may not meet with general approval. But this, it seems to me, is of secondary importance, for the dissolution of the union is a happy event, as well for Sweden as for Norway. It was the only means for bringing about a good understanding between the three Scandinavian peoples. It is true that for the moment the Swedes are decidedly opposed to such an understanding. But circumstances are stronger than men. What is happening in the Far East puts time on our side, and we can wait till the right moment comes for the consummation of this greater union.

We were united to Sweden in 1814.

The bond of union was a common sovereign. In 1827 began the quarrel which has been going on till this summer and which has eventuated in the disruption of the union. A fact in this connection should be noted. An unjust act of England was the starting point of this long struggle.

Nearly eighty years ago an English trader was engaged in smuggling at Bodö, on our northwest coast. By means of false documents and untrue statements he persuaded the British Minister of Foreign Affairs to demand damages from Norway for the seizure of his merchandise and the imprisonment of his employees. Thereupon the London Foreign Office took such a decided stand

that the Swedish Minister of Foreign Affairs was weak enough to yield and Norway had to pay. Never was perpetrated an unfairer act, and when the whole matter was unraveled the reprehensible conduct of the Swedish Foreign Office in caring, or rather in not caring, for our interests became so glaring and the comments thereon of the Norwegian officials were so full of indignation that an end was demanded of this Swedish tutelage. On every hand in Norway the question was now asked whether a free state should not conduct its own foreign affairs, especially as in this affair Sweden had assumed a degree of authority permitted neither by the Norwegian constitution nor the act of union.

Let me now enumerate some of the claims advanced by Norway, but disputed by Sweden. We asked that equal importance be given to the two kingdoms in the great seal of state; that Norway should have her own flag; that in Norway the name of that country should come first in all official documents; that the Governor of Norway should not be a Swede, for this post filled otherwise than by a Norwegian reduced our country to the rank of a province. One by one the Swedes yielded on all these points, but not without long resistance. While Norwegians were admitted to the diplomatic and consular services of the union, we could not secure what we had most at heart—viz., the conduct of our own foreign affairs. Finally, a mixed commission made up of Swedes and Norwegians was appointed to settle this and other matters in dispute between the two countries. This commission sat from 1839 to 1844, but accomplished nothing. Sweden refused to grant our demands. A second mixed commission sat from 1865 to 1869, but with no better results. The Swedes made it a condition before they would make any concessions on other points that Norway accept the Swedish Minister of Foreign Affairs. The Norwegian Storting refused. In 1885 the Swedish Parliament regulated by law the conduct of our Norwegian foreign affairs, which up to then had been a royal prerogative and which now was put absolutely in the hands of the Minister of Foreign Affairs at Stockholm. We saw in this act a direct viola-

tion of our rights. To our reiterated demand that we be allowed to participate in the conduct of the nation's foreign policy we were always given the same reply—viz., that we must recognize the Swedish Minister in these matters. In 1895 came together another mixed commission, which was divided into several factions and which accomplished no practical results. Finally, an abortive effort was made to give to each country a consular service of its own. This time the proposal came from Sweden. But at the last moment she imposed conditions which a free country could not accept. The patience of Norway was now worn out.

To these various causes of discontent should be added the embarrassing situation often occasioned in Norway by the intrusion of the King and Swedish Government into our home politics when not to the taste of Sweden. More than once our Government has had to complain of the King's interference, quite without our request, with the growth of the parliamentary *régime* in our country based on universal suffrage. From the moment when, in 1821, we abolished all titles of nobility, down to 1884, when we rejected the absolute veto power of the King, the governing classes of Sweden have tried to exert an uninvited influence in our nation.

The most natural explanation of the troubles born of the union is that the two peoples are very different and not suited to go hand in hand. The demand of the majority of the Norwegian people had long been as follows: Complete independence in the union, or separation. In the state to which things were come everybody was saying: We shall never obtain complete independence in the union, so the union must be dissolved. The means adopted to bring about this disruption may not have been the best, but since this was the system adopted, we are all one to defend it.

The Norwegian Storting decided to vote the bill concerning our having an independent consular service. Our constitution gave the Storting the perfect right to do so. The bill was carried unanimously and submitted to the King for his approval. The members of the Cabinet were unanimous in advising the

King to sign it. But he refused, adding that it would now be impossible for him to constitute a new Ministry in Norway, the former one having resigned. He also refused to go to Norway. Thereupon the Storthing declared that a constitutional sovereign without a Ministry was no longer a reigning monarch, and as the union was based on a common sovereign, it had now ceased to exist. Everybody in Norway accepted this view, and but one official refused to obey instructions emanating from the new order of things.

The spirit of the Norwegian nation is indubitably republican, and yet, in order to give the dynasty and the sister kingdom a proof of our esteem, we asked King Oscar to permit one of his family to become King of Norway. The aged monarch feels deeply hurt at what has happened and has used violent language about it; so it is very doubtful, as he is

in such a mood, that he will permit a son or grandson to reign in Norway. If he takes this course we will turn to the King of Denmark and ask him for one of his sons or we will declare for the republic. This last course will depend upon circumstances, but I think that public sentiment favors the republic.

Never was a revolution—for this was one—brought about more peacefully, and never has a revolution been based on a more noble motive. We do not desire war; on the contrary, we wish to remove an obstacle in the way of a good understanding between two peoples. Our effort is not to divide, but to unite. When the three northern nations—Denmark, Sweden and Norway—all enjoy perfect independence, then will they be in a condition to seek mutual support in a wider union and a brotherly solidarity.

CHRISTIANIA, NORWAY.

An Evening Walk

BY CLINTON SCOLLARD

BEYOND the clash and clang of cars,
The clamorous rush of trade,
One night, at earliest peer of stars,
Apart alone I strayed.

Crossing a little square where Eve
Descended, pensive-eyed,
Lo! a soft touch upon my sleeve,—
A slim form at my side!

He bowed with old-time courtesy,
And words urbane on lip,
Craving, in gracious wise, of me
A twilight comradeship.

His hat was strange; his coat was strange;
His mien had subtle grace;
Emotions swept in restless change
Across his shadowed face.

He dwelt upon the lapse of years;
His voice, smooth-toned and low,
Compassed the ecstasies and tears
Of those dead long ago.

His speech with anecdote was fraught
Of bygone beau and dame,
And evermore the sound I caught
Of Blennerhasset's name.

At length I shrank as tho a-cold;
Methought I heard a moan,
And when I turned my eyes, behold!
I was once more alone.

My questioning heart within my side
Gave sudden startled stir;—
I had companioned, stride for stride,
The wraith of Aaron Burr!

Literature

Briggs's Routine and Ideals

Six papers, or addresses, read before various societies and one poem delivered before the Phi Beta Kappa Association of Harvard University make up this cheery volume by the Dean of Harvard.* The keynote of all is given in the opening words in an address on the title subject, *Routine and Ideals*: "The older I grow, the more strongly I feel that the best thing in man or woman is being 'there.'" "Being there," he declares, "is the result of three things—intelligence, constant practice and something hard to define, but not too fancifully called an ideal." The necessity of "routine" in study and in all effort to accomplish anything worthy in the world is the constant theme. He says:

"The reaction against routine in modern education, the notion that children should be pleased with a variety of subjects made easy and interesting, rather than drilled in a few and roused to interest themselves in those few and in the thoroughness that drill demands, accounts, I believe, in large measure for the collapse of many a student's will before any subject that requires hard mathematical thinking."

The fact that the college let down the bars opening into a rather large pasture when it struck down in haste an old and perhaps outworn, or, at any rate, a much abused method and invited the newly liberated heifers to take their choice under an "elective system," the further fact that the heifers took the choice and for a long time grazed on the lawn among the flower beds, this Professor Briggs wisely ignores. It is an old story. The bars are down. It has been the task of the good dean and of many others for years past to chase the wild heifers in the "vague immense," and to reherd them, if that be possible. In this direction no man works harder or with a kindlier spirit.

The Dean of Harvard is, therefore, an

advocate of the stern routine of grammar and analysis, and finds in the lack of it his chief count in the charge against laxness of thought. Many a student, he says, will declare that he cannot understand Jevon's Elementary Lessons in Logic; many that they cannot learn geometry. These boys, he insists, "through the labor saving appliances of their schools, supplemented by their choice of lecture courses in college," have lost, or, what is almost as bad, think they have lost, the power of close logical application. Worst of all they have lost the stimulus of surmounting difficulties. How are they training themselves to be "there"?

He does not find that any particular "joy" is produced by this looseness—this inability to fix the mind. The joy of success is not to be found on "lines of least resistance." Accuracy in thought and expression is to be sought—the ability to understand precisely what is going on in the world of mind and matter is to be attained, if at all, only by a sort of work that to-day brings tears and sweat of the brow, tho to-morrow it shall bring smiles and the gladness of skies after storms. If also it brings sadness, impatience and disgust, it is, as Cardinal Newman puts it, "disgust at the random theories and imposing sophistries of dashing paradoxes which carry away half-formed and superficial intellects." By the easy method something else may come—namely, the condition of mind illustrated in the New York school girl, who, in her examination book, writing on the new ballot, says: "The Austrian ballet was introduced into this country by Cleveland to corrupt the people and keep it secret."

The dean finds a defense for the "elective system," altho he rightly attacks the abuse of the privileges of the system. In "athletics," he discovers a valuable factor of mind training, inasmuch as successful play requires close application, precision, the use of every power that bears toward a given desirable result.

* ROUTINE AND IDEALS. By Le Baron Russell Briggs. Boston and New York: Houghton, Mifflin & Co.

There is a mighty inspiration in public interest. "Never again, unless he holds public office, will the searchlight be turned" on the ambitious youth, and "never again will so many persons see what he does or fails to do."

Perhaps the good dean overestimates the value of publicity and of the joy of it. Perhaps he forgets also that the larger number in the college fraternity are not under the limelight of the public press; and as they dip deeply into the paternal purse may possibly be considering the other question: "Are there to be no more cakes and ale?"

The dean is happy in his address at Commencement to the girl graduates of Wellesley College. He believes in the education of girls to the full college extent, having little fear of evil results from it, either in the direction of "pedantry" and unwomanly dogmatism, in "masculinity" or in what is dearer than anything else to so many women—"complexion." A few late "balls," he is ready to say, will knock out the bloom of a girl's cheeks more effectively than four years of Wellesley.

Harrison's Life of Chatham*

LAST year Mr. Frederic Harrison retired from active work in connection with the London Positivist Society and gave his last annual address as president to the little group of intellectuals which has assembled every Sunday evening for so many years at Newton Hall in Fetter Lane. About the same time we saw a statement in one of the London newspapers that Mr. Harrison had left Hampstead, and at the end of a long, full and busy life, with much literary and civic achievement behind him, was living in comparative retirement amid the beauties of Surrey. Whatever truth there may be in these statements concerning Mr. Harrison's departure from London his monograph on Chatham was from internal evidence written in 1904, and nowhere in these pages is there even the faintest suggestion that Mr. Harrison has lost any of his forcefulness or power or any of the discrimination that character-

ize his earlier monograph on Cromwell in the "Twelve English Statesmen" series. Mr. Harrison's study of Chatham is based on the widest reading. Nothing in print and little that is still in manuscript or as yet printed only in the volumes of the Historical Manuscripts Commission has escaped Mr. Harrison's attention. No writer of any standing who has written on Chatham, or on Chatham's place in the general history of England, has been ignored by Mr. Harrison. He is familiar with every judgment and every estimate of every phase of Chatham's great career, and in his monograph he goes carefully over every event or episode in Chatham's life which has any significance for a student of the reigns of George II and George III and of the era in which British Imperialism came fully into being.

Mr. Harrison has not of recent years grouped himself with present day English Imperialists. No writer either in the press or in the reviews, and no speaker from the public platform, has been more severe in his condemnation of Chamberlain and the present day Imperialism. The reason for this stand of Mr. Harrison's would seem to be that while he is a great admirer of real Imperialism—the Imperialism that made this country Anglo-Saxon in its law and its civilization, the eighteenth century Imperialism with which Chatham's name is associated—he has nothing but condemnation for spurious Imperialism; and by spurious Imperialism Mr. Harrison means "small colonies of white settlers holding in serfdom vast masses of some inferior race." Chatham, to Mr. Harrison, was a real and not a pinchbeck Imperialist; and it is for this reason that Mr. Harrison admires him, and writes so glowingly yet always so discriminatingly of his achievements as a Parliamentary orator and as the great founder of the British colonial system.

There have been many estimates of Chatham since Macaulay wrote his second study of him for the "Quarterly Review" sixty years ago, and since then has been written at least one fairly full and careful biography of the Great Commoner—that by Mr. Walford Davis Green, M. P., for Messrs. Putnam's "Heroes of the Nation" series. Mr.

* CHATHAM. By Frederic Harrison. New York and London: The Macmillan Co. Pp. vi, 239. \$1.25.

Frederic Harrison's monograph, however, is for the present the best study there is of Chatham; and both for those who like a clear, direct and masterly style and those who are interested in Chatham's great achievements Mr. Harrison's study must now take the place of the two long essays on Chatham which are to be found in Macaulay's collected works.

India

ABOUT one-half of this work* is devoted to the physical geography of India, the remainder to the people, the political divisions, agriculture and revenue, railways, minerals and climate. It is illustrated abundantly and the maps are large and plain. The author, late superintendent of the official survey of India, has probably no superior in point of special knowledge of his subject. The chapters on physical geography are designed for study with the open map at hand; the others lend themselves to ordinary reading, but they are all so full of interesting information and so ably written not only from a scientific, but from a literary, point of view that the book is singularly entertaining.

Note this description of the dust storm, which is the first sign of the regeneration of dead nature after the hot weather:

"No column of troops could have advanced with such a level front, with such apparently resistless action, or with one-fifth its velocity. There was not a break in the flat wall of dull, red sand which reached upward some 200 feet above the plain, presenting its red brown front to the mountains with purple wisps and streamers curling aloft like the banners of a Dervish army. So long as the plain was unbroken and its surface level, not an opening or an indentation could be marked, but as soon as it reached the slanting spurs of the lowest hills, rushes were made from flank and center. Small clouds of skirmishers steamed up the narrow gullies between the spurs, mounting high and falling backward, as the waves fall, ere they reached the summit of the hill. Soon the whole atmosphere thickened, and altho no great amount of dust reached upward to the 4,000 feet of elevation on which I stood, a smart shower of rain put an end to further observations." Then after

the rain, "in an almost incredibly short space of time the known surface of an uninteresting level of endless plain is changed into a sea of vegetation. Not only do the young crops spread in vivid green expanse against the gray background with startling rapidity; but ill gotten weeds appear in every crevice of the broken wall and pasture land and in every unoccupied space of the cultivated garden. The gardener rejoices in a new birth of flowers and resigns himself to philosophical contemplation of the weeds and watches both grow together under the magic influence of the rains in rank abundance. Life becomes endurable once more; birds begin to chatter (they never sing under any circumstances in the plains of India), and the cultivator turns to the consideration of his annual rotation of crops."

The last clause rather rapidly drops into prose, but there is poetry in what precedes. So there is in the descriptions of the highest of all mountain peaks, Everest, 29,000 feet above the sea level, or of the valleys into one of which "the whole of the Bernese Alps might be cast," or the word picture of Ceylon where "the yellow robed priest is always *en evidence*, and the bells of the temples and the chant of the scholar learning his monotonous incantations and prayers as he sits under a hedge of sun-flowers or the shade of the temple portico," and where "are sixteen square miles of ruins—grass-grown jungles in which the contemplative stone figures of Buddha stare solemnly through the ages; forests of l  ts and pillars surrounding the ruins of tanks; foundations of monasteries, temples, walls and edifices, which must once have been the glory of the Buddhist world."

Nor are marvels lacking; not the least the astonishing success of the Indian Government in stamping out disease and petty war with a resulting increase in population of 20,000,000 souls in ten years; or, on the other hand, its failure to check the mortality from snake bites and attacks of wild animals, the first killing 21,000 and the second some 5,000 people in a single year.

After Miss Scidmore's sarcastic girding at the Indian railways in her "Winter India" it is a little surprising to be told that "probably nowhere in the world can the traveler by rail move with more comfort than in India"—and this

* INDIA. By Col. Sir Thomas Hungerford Hol-
dich. New York: D. Appleton & Co.

is not the only instance of such differences of opinion. But the India of the tourist, as the author very plainly demonstrates, is never the India of the resident in any particular and due allowances must be made.

Altogether, as a representative volume on India for the library, this book is about the best to be had, and if the disturbance in the East should shift ground to the Indian frontier and lead to a trying out there of conclusions between England and Russia the geographical data here given will be invaluable in following the military developments.

The Mind of Whittier. A Study of Whittier's Fundamental Religious Ideas. By Chauncey J. Hawkins. New York: Thomas Whittaker.

Probably the readers of Whittier as a rule are content to find in him the poet—the choice interpreter of man's moods in relation to his brother man and to external nature. Mr. Hawkins, in his little book on *The Mind of Whittier*, prefers to trace one phase of the poet's thought—his mental attitude toward religious thought and creed. Brought out every Sunday to the Orthodox Quaker meeting-house, and sitting there from childhood to manhood, the shy boy poet from the shoemaker's bench in East Haverhill very naturally imbibed the clear, quiet spring waters of that faith, and got a liking for them which lasted through life. The fact that interests us most is that he was a full and splendid man, burning with hatred for wrongdoing and a generous love for the wrong-doer as soon as the mischief could be spanked out of him. His general creed is easily put. He states it himself in a poem to "a beautiful girl"—one of his sweetest, frankest reminiscential poems:

"And wider yet in thought and deed
Our still diverging paths incline,
Thine the Genevan's sternest creed,
While answers to my spirit's need
The Yorkshire peasant's simple line;
For thee the priestly rite and prayer,
And holy day and solemn psalm;
For me the silent reverence, where
My brethren gather, slow and calm."

Amplify this creed, as Mr. Hawkins very

earnestly and cleverly does, through a hundred instructive pages, build into it as much volcanic energy as a poet can have and not explode, brighten it with fancy, a ripening taste for color and music; pure, absolutely pure thoughts, and deepen it with a yearning love for his fellow man, and you have a creed that shall, as Mr. Hawkins shows, include the doctrine of The Inner Light, so dear to the Quaker, poetic Optimism, so easily mistaken for Universalism, and an abiding faith in humanity as inspired by the creative energy which no sane church in these days would be willing to think of as altogether eliminated from its own living articles of faith.

The Return. By Alice MacGowan and Grace MacGowan Cook. Boston: L. C. Page & Co. \$1.50.

This is the first novel we have of Colonial life in Georgia. The scenes are laid in Savannah and on the sea islands off the coast of Georgia during 1739, where General Oglethorpe was establishing his colony of Irish, Scotch, German and Italian immigrants, protecting the southern coast of the State from the Spanish dons at Saint Augustine and making a sort of perpetual peace with the Creek Indians. And it is as good a story as Mary Johnston ever wrote of the Virginia Colonies, and more veracious. One can at least recognize the common earth in this tale, which no reader ever did in Miss Johnston's green velvet and rainbow descriptions of natural scenery in Virginia. The story is unique in the fact that the historical details have been so vitalized as to become the most interesting feature of the book. There is so much which is thrifty, cheerful, wholesome in the pioneer occupations described; and the love affairs of Mistress Diana Chaters, the fine airs of Lord Paris, the graver character of James Oglethorpe, all add the various personal elements of what is lovable, humorous or dramatic to the situation. The book is written in an excellent literary style, and it is to be regretted that it did not appear four years ago, when the authors first contemplated writing it and when the historical romance had not run its course as a fashion in fiction.

Beauty Through Hygiene. Common Sense Ways to Health for Girls. By Emma E. Walker, M.D., Member of the N. Y. Academy of Medicine, etc. New York: A. S. Barnes & Co. \$1.00.

This is the most practically straightforward book on this subject that we have seen. Dr. Walker has pointed out in easily intelligible detail just how beauty does depend on health and how health may be fostered and even regained when lost. All the importance of regular exercise is emphasized, and, what is more necessary in these days of the athletic girl, the proper limitations and even dangers of muscular activity in excess are pointed out. In general, the frequently repeated directions not to take up habits of any kind that are supposed to be for the benefit of health or personal appearance without consulting some one whose capability is undoubted and with regard to whom no possible hesitation as to the giving of interested advice can be entertained are likely to keep overzealous seekers after beauty from many mistakes that may prove harmful rather than helpful. The chapters on The Fat Girl, The Thin Girl, Corrective Exercises, Massage, Bathing and Care of the Hair are sure to prove of special service in this way. The chapter on Exercises in Housework is decidedly suggestive and will be read with interest by mothers at least, if not by daughters. There is, perhaps, one fault that should be pointed out in the book: While very careful, as a rule, with regard to drug suggestions, there are certain materials mentioned approvingly (mainly antiseptics for external use) that one does not like to think of young folks having round them, since accidents are so prone to happen and the young are thoughtless.

Studies in Ancient Furniture. Couches and Beds of the Greeks, Etruscans and Romans. By Caroline L. Ransom, Fellow in the University of Chicago. The University of Chicago Press. 4to, pp. 128, plates xxix. \$4.50.

Miss Ransom's work fairly earns her Ph.D. degree in archeology. She has been studying for two years, especially in the Berlin Museum, under Professor Erman, and others devoted to Egyptian and classical remains. If the general title of

this book indicates her intention to pursue other studies in ancient furniture she has a wide field before her, not too much pursued. This volume treats solely of couches and beds, and those only of Greek and Italian workmanship. It does not touch Egyptian, except as it is also Roman; nor the rich remains of Assyria and Babylonia, whose seats and couches are often figured. The plates and other illustrations in the text are many and well chosen, and the references and discussions in the notes show careful research and sound scholarship.

Out of Work. A Study of Employment Agencies, Their Treatment of the Unemployed and Their Influence Upon Homes and Business. By Frances A. Kellar. New York: G. P. Putnam's Sons. \$1.25.

Miss Kellar and her associates, during their investigations, visited 732 "intelligence offices" and employment bureaus in several of the larger cities, now in the guise of employees and now in that of employers. Her volume records the information thus gained and proffers certain suggestions of remedial measures. The information recorded is exceptionally valuable. The vicious character of the majority of these agencies is plainly shown. They are unjust and often brutal in their treatment of applicants for work; many of them are in direct partnership with thievery and prostitution, and the moral tone of 75 per cent. of them is demoralizing to all persons who come in contact with them. Forty per cent. of the "intelligence offices" have neither equipment nor system. Another 35 per cent. are but little better, and in only 25 per cent. are the conditions good. These latter are the agencies "where there are no lodging places, where there is an adequate equipment and good system, and where some measure of courtesy is shown both employer and employee." The vicious treatment of the applicants is a subject to which the author frequently recurs.

"In some offices, even the best," she writes [it], "is so brutal and humiliating that our increasing wonder is that employees are as good as they are. We are absolutely sure we could not have continued the rounds of these offices, seriously looking for work, as these women do, year after year, without becoming

untruthful, dishonest, impertinent and perhaps intemperate and immoral."

It is to the establishment of State employment bureaus and the regulation and constant inspection of private bureaus by the State that the author looks for any adequate improvement. The volume is worthy of high praise and it should be widely read.

Literary Notes

THE L. R. Hamersly Company has issued a revised edition of "Who's Who in New York City and State." While the 1905 edition is by no means perfect, it is a fact that it is greatly superior to the first edition of the local "Who's Who."

....The first number of *Current Literature*, under the management of Mr. Edward J. Wheeler, resembles the *Review of Reviews* as it was before it drifted from its original purpose and fell into line with the conventional magazine. It contains over a hundred pages of abstracts and quotations from current magazines and books well selected and admirably edited, and an interesting narrative of current events.

....Now that the question of Government regulation of railroads has come to the front the appearance of a comprehensive work on "Interstate Commerce," by F. N. Judson (T. H. Flood & Co., Chicago, \$5.00), is of special importance. It includes all the federal legislation relating to common carriers and the rulings of the Interstate Commerce Commission, together with a history of the development of Governmental control from the adoption of the Constitution to the most recent court decisions. In this connection may also be mentioned a little book published by Ginn & Co. (50 cents), containing a discussion of "President Roosevelt's Railroad Policy Before the Economic Club of Boston," by Charles A. Prouty, David Willcox, Judge Grosscup and Professor Parsons.

....A significant and gratifying indication of an awakening of civic pride is evinced by the demand for a second edition of Charles Mulford Robinson's "Modern Civic Art; or, The City Made Beautiful" (New York and London: G. P. Putnam's Sons, \$3.00 net), for as the author realizes a call for a new edition in this case may be understood as meaning the progress of the cause for the furtherance of which the book was prepared. This is the best, the most authoritative, the most useful book we have yet seen for the 1,200 local improvement societies and for all individuals seeking to advance the same cause. It provides a wealth

of information on the problems of municipal esthetics and points out the best known ways of solving those problems. By adding to the beautiful letterpress some thirty good illustrations of notable examples of civic art, the publishers have made a handsome volume worthy of the subject.

Pebbles

"THIS is a great blot on my life," said ex-Prexy White, as he spilled the ink bottle over his new autobiography.—*Cornell Widow*.

...."Our elevator fell down the other day." "Was anybody hurt?" "Not exactly, but four got the dropsy."—*Yale Record*.

....*Jess*: "I'm afraid that I'll never learn to swim." *Sue*: "Why not?" "Tom won't let go of me long enough."—*Cornell Widow*.

The window has three little panes,
But one have I;
The window's panes are in its sash,
I wonder why?

—*Gelett Burgess*.

Flo was fond of Ebenezer,
Eb for short she called her beau.
Talk of "tides of love." Great Cæsar!
You should see 'em Eb and Flo.

—*Cornell Widow*.

....An English servant of one of our great houses much astonished the family minister, who had called to make inquiries on the occasion of the birth of a child. "Is it a boy?" "No, sir." "Oh! a girl?" "No, sir." The inquirer gasped, and the servant continued, with dignity: "Madame has given birth to an heir."—*Smith's Magazine*.

....A teacher was trying to illustrate for a class of boys and girls the meaning of some long words. "What is polygamy?" The answer was, "When a man has several wives." "What do we call it when he has only one?" "Monotony," was the prompt reply.—*Ladies' Home Journal*.

....Mrs. Ed. Raines, living five miles north of town came near bleeding to death from an accidental cut on her arm in trying to extricate a horse from being entangled in its harness, a friend had driven to their home and tied the horse in front of the house and in some way got so rapped in the harness that Mrs. Rains in endeavoring to the harness and extricate the animal in some unaccountable way, by the floundering of the horse the knife was forced into her arm slashing it to the bone and severing an artery which threatened for a time of their endeavors to stop it, but after the loss of much blood they were able to cease the flow and she getting along nicely.—*Fairfield, Ia., Weekly*.

THE Semi-Annual Index of THE INDEPENDENT is now ready and will be sent free to any subscriber who will notify us that he wants a copy.

The New Secretary of State

WE have lost one great Secretary of State, but we are now to have another. If Mr. Hay himself could have chosen his successor, he would have named Elihu Root. When death so unexpectedly made the highest of Cabinet offices vacant, the President turned to Mr. Root, because he knew, as Mr. Hay had known, how complete was Mr. Root's equipment—in character, experience, poise, judgment, and administrative force—for the place from which Mr. Hay had been taken away. And the opinion of Mr. Roosevelt and Mr. Hay as to Mr. Root's extraordinary qualifications for the office which he has now accepted is the opinion of all thoughtful Americans who are familiar with public affairs and are not blinded by narrow partisan influences. This is to be seen in the comments of the press, not only of those journals which speak for the political party with which Mr. Root votes, but also of many that oppose his party and its policies.

He re-enters the Cabinet to take up that part of the Government's work for which he is best fitted, altho, when we think of what he has already done, we must admit that there is no other Cabinet office in which his special fitness for its duties would not be shown or in which he would not exhaust all possible opportunities for effective and enduring service. One would not have said that there was anything in his training or experience to qualify him for notable achievement in the office of Secretary of War, but memorable reforms and great improvements due to his genius and labor while he was at the head of the War Department will always be associated with his name. Still, it is true that his temperament, his sure judgment, his broad intellectual grasp and his ability to solve complicated problems of great mo-

ment point to the Department of State as the place in which his powers can best serve the public interest. And it happens that his previous Cabinet experience—in military affairs, in the government of the Philippines, and in his temporary control of the State Department itself at the time of the Boxer rebellion in China—has made him familiar with important phases of the work to which his entire attention is now to be given.

Not only on account of the influence he is to exert and the work he is to do in connection with the duties which are peculiarly his own, but also for the reason that his advice and influence concerning topics of general Cabinet discussion will be of very considerable value, are both the President and the country to be congratulated because he again takes a seat at the Cabinet table. Mr. Root has well-considered opinions of his own as to public policy, and can support them. Both for him and his judgment the President, during the last twenty years, has entertained the highest regard.

There has been much discussion as to the motives which led Mr. Root to accept the office. He withdrew from the Cabinet nearly a year and a half ago because he believed it to be his duty to seek the rewards which the practice of his profession offered to him. He has since been exceptionally successful and his professional income is said to exceed \$200,000 a year. This he has chosen to surrender for a salary of \$8,000 and an office in which an annual expenditure of three or four times that sum cannot well be avoided. It has been said by many, and not, as a rule, in a spirit of hostile criticism, that he could not have given up so much if his purpose had not been by re-entering the Cabinet to promote his nomination for the Presidency three years hence. This, it is asserted, must have been his controlling motive.

We do not think it was. It is true that he gives up what is probably the largest professional income now known to the American bar. But, because he is the man that he is, he does not seek an enormous fortune above all things else. He

is fond of his profession, in which he has attained the highest rank, and he would have continued happily to work in it and to earn, if this opportunity to serve elsewhere had not called him away. He has not taken us into his confidence as to his motives, but our knowledge of the man compels us to believe that he yielded to this call because he thought it was his duty to do so—because he thought he was needed in the place where he is to be. Already he has a considerable private fortune. For a man who has so much and whose conception of public duty is what we believe Mr. Root's to be, it is not a sacrifice to do what he is doing. It satisfies his conscience and is a pleasure.

Moreover, the office is very attractive to a man of his ability and character. There does not exist a more exalted one of its kind. Many problems of great international importance are to come before the American Secretary of State in the immediate future, and the reputation to be gained by Mr. Root in his treatment of them will be established throughout the civilized world. In his profession he has reached the top. There is enough in the duties and the opportunities of this public office to draw him away from the further pursuit of wealth.

Those who say that Mr. Root seeks to promote his nomination for the Presidency should remember that not for forty-five years has that office been reached by way of the Cabinet, and that the Secretary of State has almost no patronage that can be used for his political advancement. We believe that his controlling motive was a desire to serve his country in a place where he could be most useful, where the service itself would be enjoyable, and where success would have its due reward of good fame. The office itself which he has accepted has no power that could be exerted to promote his candidacy for the higher one, even if he should desire so to use it. Such power lies only in the man who holds the office, in his character, his ability, his achievements. It sometimes happens that faithful and admirable performance of duty in public office, with no ulterior purpose in view, wins from the people a reward that may have been desired but was not sought.

The Two Revolutions

THE twentieth century will reveal, far more clearly than the nineteenth century did, the profound difference between the Fourth of July and the Fourteenth, between the American Revolution and the French. Americans have never failed to proclaim a difference, with naïve self-satisfaction; but they have not often proclaimed the whole, or the exact, difference.

The American Revolution was a declaration and achievement of national independence, the birth of a national State. The French Revolution was the self-emancipation of a people, the birth of a new kind of human society; the first attainment of a certain stage of civilization, imperfectly imagined by the Greeks, but only as a dream, a Platonic Republic, yet destined to prevail throughout the world if not in the twentieth century perhaps in the twenty-first.

The French Revolution was more dramatic than ours, more terrible in its incidents, more unrestrained as an outburst of human passion, more radical in its program. These differences the American has seen or felt, with pride in his imperturbable Anglo-Saxon blood. He has not quite realized how radical the French Revolution was, how far-reaching; above all, how original, how creative, it was.

For while the American Revolution was in a measure economic, social, intellectual and moral, a stirring of all the waters of life, it was primarily and chiefly a war of separation, a struggle for independence of national life, and, therefore, essentially political. The French Revolution was incidentally political; it was primarily and essentially economic, social, intellectual. It left no idea, no belief in interest, no relation unchallenged. It was a merciless, all-searching judgment of human pretensions, achievements, laws and institutions. But it did not stop with destruction, as the superficial reader of history is too apt to imagine. It was marvelously creative.

The lapse of a century was necessary to throw into clear outline against the background of cruelty and desolation the positive work, the broad, substantial reconstruction of the whole intricate fabric

of human society that the titanic forces of the Revolution accomplished. We are beginning to discern it. Our children will see its proportions and details. They will realize, as we do not, that not only did the Revolution destroy medieval society as it destroyed medieval Paris, but that it created a new society as surely as it created the superb avenues and esplanades of the Paris of to-day.

What is the essential characteristic of that new society which the French Revolution created, wherein does it differ from the American society born of our own struggle for independence, and why must we say that the French creation rather than ours contains the promise and potency of the coming civilization?

The answer to these questions need not be long or difficult. The French Revolution, for the first time since civilization began, created a society based on the ideas of unity, liberty *and equality*. Early civilizations, the great Eastern civilizations, grasped the constructive, the imperial, ideal of unity. They welded heterogeneous hordes into homogeneous peoples. Greece grasped the idea of liberty; she set free the intellect and the creative spirit. The American Colonies, revolting against British oppression, grasped the idea of unity and liberty, balanced and combined. But they were far from believing in social or economic equality. On the contrary, the elements that became successively the Northern Federalist and the Southern slave owning Democrat were among the most intensely aristocratic social classes that ever played a part in the national life of our people. But for a certain kind of liberty Americans have had an insatiable lust—the liberty of the man of enterprise to explore, to invent, to assume risks, to organize, to control industry; this liberty we have almost fanatically defended against encroachment. And with what result? We have created in a single hundred years, in this land of the free, the most astounding economic inequality that has ever been seen among men. We have permitted to grow up in the Republic to which the men of the Revolution consecrated their lives a plutocratic oligarchy immeasurably more powerful than the Senate which trans-

formed the Rome of the Republic into the Rome of the Empire.

It is not then the American Revolutionary idea of a society combining liberty with unity that of itself is adequate to shape the ultimate type of human civilization. Circumstances conspired to evolve from the wild destruction of the French Revolution another idea, which must be combined with our American ideas for the salvation of the republican ideal of a scheme of social order of, for and by the people. Liberty must be tempered and restrained by a generous measure of objective equality. Many of the great resources of the earth and many of the dominant forms of capital must ultimately be owned by the public—that is, by all men equally—if we are to have the highest type of social organization and that gracious social equality among men without which the finest character and the truest happiness cannot exist.

Not all nations must go through a struggle for political independence; but one day or another they must all go through that social revolution—not necessarily with bloodshed, let us hope—of which the great spectacular French Revolution was the terrible but glorious beginning.

Thoreau's Journal

WHEN Emerson went on a lecturing tour through the West—it was during Civil War days—carrying his messages for the first time to the Prairies and the Lake States, he liked to talk about Boston men and things. He always spoke of Agassiz as “Our great man,” and of Quincy he spoke with special affection, but he invariably called Thoreau “Our Boy.” “Our Boy,” he said, “has left piles of manuscript, and we are looking for some one to edit it.” His Journal Emerson thought to be of special importance, and that it must be trusted only to some one who could comprehend Thoreau. A good deal of this old material to which Emerson referred has been edited in two previous volumes—not altogether acceptably.

The publication of the Journal, which is now undertaken by the *Atlantic*, under the editorship of Henry D. L. Thoreau,

is one of the literary events of the year. We are inclined to believe, with one of the Chicago journals, that Thoreau has only begun his career with the American people. He probably had a great deal to do with sustaining the natural taste for country life, which is inherent in the American people. But he did much more than this—he elevated that taste—infusing elements of a philosophic and religious sort, which recall the Greek spirit. As a literary production the Journal is more nearly to be compared with "Maine Woods." This last—the "Maine Woods"—has a wild flavor of its own and a simplicity that separates it from all the rest of the volumes previously published. The Journal will meet the mood of our times, which is flavored with a reviving love for the country.

Thoreau complains frequently that he cannot find interesting human neighbors—that he is obliged to go to the chipmunks and the beavers for rational companionship. He knows "only one" with whom he can walk and talk—he does not say that one is Emerson. He thinks he might as well sit in a barroom with most people as try to walk and talk with them. People are rarely "side by side" in their thoughts. He thinks most people are spoiled by civility.

"You can have no profitable conversation with them they are so conciliatory, determined to agree with you. They exhibit such long suffering and kindness in a short interview. . . . I would meet with some provoking strangeness, so that we may be guests and hosts and refresh one another. It is possible for man wholly to disappear, and be merged in his manners. A cross man, a coarse man, an eccentric man, a man who does not drill well—of him there is some hope. But your gentlemen, they are all alike."

He finds common laborers, fishers and hunters, and even loafers, more interesting than conventional gentlemen; for with the former he can spin yarns, and when they get through each one is still himself. But a gentleman who comes for an hour or a day, to be polite and to be treated politely—why, with him there is no living. He wishes his neighbors were wilder; but most people, after all, if robbed of the conventional would be only weeds.

It will, however, be a mistake to think

of Thoreau as lacking in social instincts. He was constantly hunting for companionship. He reproached himself because he could find nothing attractive in the employments of most people—skipping men and their affairs—the professions and the trades not elevating them, at least in his thoughts, or getting any poetry out of them. "It is narrow to be confined to woods and fields and grand aspects of Nature only." He allows that the greatest and wisest will still be related to men. Why not see a man standing up in the sunshine and casting a shadow even as a tree? He concludes that he

"will try to enjoy them as animals, at least. Do not neglect to speak of men's low life and affairs with sympathy; altho ever speak so as to suggest a contrast between them and the ideal and divine."

He says in another place that he has got to that pass with his friends that their words do not pass with each other for what they are worth. His friends find fault with him because he walks so much alone, while pining for a companion, and then puts down his thoughts in a diary, instead of seeking to share them generously with a friend. Then comes the apology that in our highest moods we are of necessity isolated.

"The mind that perceives clearly any natural beauty is in that instant withdrawn from human society. My desire for society is infinitely increased; my fitness for any actual society is diminished."

A nice comment on Emerson's definition of him as a boy is a passage that records his amusement at hearing "R. W. E." tell how he drove his own calf out of his yard into the street when it was trying to come in with his cow—not thinking of it as his own. Emerson at that moment was probably thinking over one of his essays on farming. But it is a curious fact that about those days Thoreau was feeling slighted by the world because he was not invited to lecture. He tells us that he had offered himself much more earnestly as a lecturer than a surveyor, yet he was not invited

"to lecture once last winter, and only once this winter; but I can get surveying enough—which a hundred others in this county can do

as well as I—tho it is not boasting much to say that a hundred others in New England cannot lecture as well as I.”

Really, why did we not invite Thoreau in those days instead of Emerson? We had not caught up with either. But Emerson we did not understand, and it fostered our high opinion of ourselves to pose as those who did. In these days Thoreau would be the man. He would have the crowd, but probably would not be glad, for as yet we are not sincere Nature lovers; we have not got by glorifying the city.

Like every true naturalist, Thoreau loved the morning—it was his boyishness again. He says:

“It is a test question affecting the youth of a person. Do you sympathize with the morning? Are you abroad early, brushing the dews aside? If the sun rises on you slumbering, if you do not hear the morning cock crow, what relation have you to wisdom and purity? You have forgotten your Creator and the days of your youth.”

But if he were to choose a time for a friend to make a passing visit, from some other to this world, for the first time, it would be at a moment when the sun was setting with splendor in the west; his light reflected far and wide through the clarified air; after a rain, and a brilliant rainbow overarching the eastern sky. Would he be likely to think this a vulgar place to live in—a place where one would be compelled to devote his life to dissipation and frivolity? He is quite sure that a man traveling from world to world, and reaching our world at such a moment, would wish to take up his abode here.

Summer is good because one can live out of doors.

“It behooves us to break up this custom of sitting in the house—for it is *only* a custom, and it does not have the sanction of common-sense.”

Fowls do not leave their perches in the morning and then go back to them every few minutes all day. One should walk and get into communion with just as much of Nature as possible; but you must walk so gently to hear the finest sounds, the faculties being in repose. “Your mind must not perspire.” He considers out of doors the place to constantly store up influences, and indoors a

place where expression can shape itself. He can go nowhere in the wide world without he finds the pressure of the intellectual atmosphere to be fifteen pounds to the square inch. A house is good for something only when he wants to get away from that pressure, relaxing himself.

In autumn he finds Nature in a mood even more enjoyable. “For joy I could embrace the earth. I shall delight to be buried in it.” He sometimes feels that he is rewarded merely for expecting better hours. He is rich in the autumn days, for he can smell the ripening apples, and the autumn flowers give themselves to him. Even the strong wormwood scent which belongs to the season feeds his spirit and endears him to the earth. At this period he gets a touch of mystical worship—loses Thoreau for once in the Puritan—exclaiming:

“I thank you, God. . . . I do not deserve anything; I am unworthy of the least regard; and yet I am made to rejoice. Ah! I would not tread on a cricket, in whose song is a revelation, soothing and cheerful to my ear. Oh, keep my senses pure! And why should I speak to my friends, since how rarely is it that I am I, and they also they.”

He loved the water.

“Full moon. Arose and went to the river and bathed, stepping carefully not to disturb the household, and still carefully in the street not to disturb the neighbors.”

He would lie down, he tells us, on the sandy bottom, but found it difficult to get wet through. “I would fain be the channel of a mountain brook.” All this ripens into a natural religion—still boyish, for all natural religion comes down to us from a boyish age of the world, and bubbles up once in a while in its old time simplicity. It ripens into the maxim of true evolution. “Not secret but sacred are all the forces of life.” He would treat himself as tenderly and purely as the most innocent child.

“Let me forever go in search of myself; never for a moment think I have found myself. What temple can there be but the innermost part of my own being? It is the love of virtue makes us young forever. I love and worship myself with a love which absorbs my love for the world. May I dream not that I shun vice; may I dream that I loved and practiced virtue.”

Plain Answers to Plain Questions

A CORRESPONDENT from the Gulf States requests answers to these direct questions, which he seems to imagine will be "posers":

In your editorial of June 29th, you say regarding a clipping from a Southern Church organ:

"But race antipathy is not ineradicable, as is abundantly proved the world over. It is a cultivated vice."

Now if by antipathy you mean objection to social equality, I would like to ask you a few questions:

First.—Do you really believe that the Southern people *should* mingle with the negroes on terms of social equality?

Second.—If you lived in the South, would you invite negroes to your home and receive them on terms of social equality?

Third.—Do you now mingle with them on terms of social equality?

Fourth.—Admitting for the sake of argument that a negro could be elevated mentally, morally and every other way until his smell and other physical differences formed the only distinction, would you then be willing for him to marry a female member of your own family?

These questions are asked for information. I simply want to know if there are people who really hold such views. I credit you with honesty in your opinion, and I have a curiosity to know whether or not you would be willing to apply the Golden Rule in this instance. Hoping to hear from you, I am, very respectfully,

WINONA, MISS.

WM. C. WARD.

In answer to these questions we reply,

1. That social equality does not concern us. We never discuss the matter nor urge the practice. Indeed, we do not believe in social equality, within any one race or between races. People are not equal, for social purposes. All of us find some people disagreeable; and with them no social relations are possible. Social relations go by favor and nobody has the right to complain if they are refused. All we demand is political and civil equality.

2. Therefore we do not believe that "Southern people," meaning, we suppose, Southern white people, "*should* mingle with the negroes on terms of social equality," unless they feel like it; nor with white people either. If the colored people are of their own intellectual and social grade, agreeable com-

panions, we see no reason why they should be blamed for mingling with them socially. Especially do we object to what we know has been a social relation, and the most intimate possible, but illicit, which has produced millions of offspring of mixed blood.

3. We are asked if we would "invite negroes" to our home, if we "lived in the South," and if we "now mingle with them on terms of social equality." That depends on the negro. In the South the Editor of THE INDEPENDENT has sat with negroes at their table in their home and enjoyed it; and he has entertained negroes at his own home, and no hurt done. But they were intelligent, cultivated people. What he would do if he lived in the South he cannot tell, but he hopes he would not mingle socially with ignorant and disagreeable people of any shade or tint.

4. Our correspondent wants to know whether, in the case of a negro mentally and morally satisfactory, we would be "willing for him to marry a female member" of the family. There are negroes and negroes. Some of them have been so bleached in the South that when they go West or come North they pass as white; indeed, they are negroes only in the Mississippi or Virginia patois. In the case of people having a distinct color, black, red, yellow or brown, we would prefer that there should be no such intermarriage, because the Editor prefers the color in which he was born to any other, but does not quarrel with the preference of other people for their own. Further, with the predominant white population, he thinks it would be more agreeable for such female member and for her children that she should marry with those of her own color. Equally we should prefer that a male member of our family should marry a white woman; but we know there are those who desire a darker shade, and we think the laws which in Mississippi forbid intermarriage of the races are wicked, and that they tend to create many illegitimate unions. Doubtless our correspondent has known many such. We know what sad difficulty teachers of the better colored schools have in preventing their educated and cultivated girls from being snapt up by white men in respectable

society and introduced into an irregular relation, which in New York would be a common law marriage, or which is a virtual polygamy. And with no visible sense of shame, indeed with a sense of duty, the fathers bring their children, still lighter than the mothers, to these best negro schools for education. We know of what we affirm, and can specify the instances.

Here is the amazing blindness of our critics. The section which is dead against social equality is the same that practices it most. Every small Southern city has its district where these permanent relations are carried on; for we are not talking of promiscuous immorality, but of unwedded wifedom—in not a few cases unwedded solely because the law forbids. And what is the result? The gradual and somewhat rapid bleaching out of the negro's color. Thousands have already passed the line. They have become pure Caucasians. The process will go on, and the farcical thing about it is that the section which most pretends to stand in terror of social relations is that which most supports them. Meanwhile the white race is not being darkened, and appears to be in no danger of it, while the black race is steadily whitening, and is likely to whiten more and more, by the preference of darker women for lighter men, until in time the black race will be eliminated on the continent. The present effort of the South to attract immigrants from Europe, and especially from Italy, will increase this effect, for they have not learned to pretend a "race antipathy." There never has been in the history of the world any race antipathy such as would prevent marital relations. White men have shown no such antipathy in the United States or in Latin America, whether with negroes or Indians; and equally in India, China, Japan or the Philippines do the multitude of mestizos and other half-castes support our casual remark that race antipathy is "a cultivated vice."

American Schools of Archeology

THERE are three American Schools of Archeology in the Old World, one at Athens, one at Rome and one at Jerusalem. They represent the methods and

the hopes of the best American scholarship in its study of classical and biblical history and art. There ought to be two more American Schools of Archeology, one in Baghdad, for Assyriology, and one in Cairo, for Egyptology. What university, or what man of wealth and scholarship, will found such a school? Why should we want England or Germany or France to set us the example, as they have done in the other cases? Now the teacher of Greek or Latin is hardly equipt if he has not studied his department in Rome or Athens; and the biblical teacher is equally lacking if he has not carefully traced the footsteps of David and Jesus in Palestine. The students may be few who attend these schools, but they will be the choice teachers of the next generation.

A letter just received from Prof. N. Schmidt, of Cornell, who is in charge for the year of the American School in Jerusalem, tells us that he and his pupils have completed the circumnavigation of the Dead Sea, so that it is now possible to supplement in various directions the results gained by the two previous expeditions, the American expedition of Lieutenant Lynch, in 1848, and the French of the Duc de Luynes, in 1863. Of course, the results of this exploration will be subsequently published in *The American Journal of Archaeology*. Since their return from the Dead Sea Professor Schmidt and his pupils have been exploring the Negeb, south of Palestine, and have had the good fortune to discover thirty unpublished Greek inscriptions, some of them dated, near Ruheibeh, the ancient Rehoboth. With scrupulous fidelity the stones were left *in situ*, the Turkish authorities were advised of the discovery, and squeezes were taken for publication. These are the first inscriptions found in this hitherto little known region.

The American School in Jerusalem has been put under the charge of a committee, of which Prof. J. Dyneley Prince, of Columbia University, is chairman. It greatly needs a building of its own for the residence of the Director and students, and the library, and with a room for a biblical museum. Of course the building will come when the right man sees the need.

But quite as much is such a school needed for Egyptology, and another for Assyriology, and in both of these America has as yet no rival. We are just beginning to make explorations with real success in Egypt, led by the University of California, under the charge of Professor Reisner, of the University of California, and by Professor W. Max Müller, of Philadelphia. Cairo would be the best place for such a school, for there is the splendid Khedivial Museum.

The proper place for an American School for Assyriology is at Baghdad, and it would be comfortable for six months in the year. There is no museum or School of Archeology in this, one of the two richest regions of the world for the historical student, a region where new finds are made all the time, and from which we must learn the earliest history of civilization; a region full of monuments from the beginning of human culture down to the period of the great Jewish glories of post-Talmudic times, not yet investigated where they flourished at Nehardea and Pumbeditha. Americans have taken part in three expeditions of exploration and excavation, of which that of the University of Pennsylvania, carried on by Dr. Peters and Dr. Haynes and concluded by Dr. Hilprecht at Nippur, is best known, while that now being carried on by the University of Chicago is full of promise. But a permanent school and home for American study at Baghdad is much to be desired, the Director of which might be the American Consul. Very likely a gift of \$200,000 would put such a school on a permanent foundation, and do much for American scholarship and for the opening of the buried history of Babylonia, Assyria, Persia and the neighboring regions.

The Wrongs and the Rights of Porto Rico

It is now some seven years since General Miles was welcomed with shouts of acclamation when he raised the American flag on the soil of Porto Rico. There were flowers and processions. On the 28th of July, 1898, General Miles issued a proclamation declaring that the army of the United States had come to occupy the island and to bring to its in-

habitants "the fostering arm of a nation of free people, whose greatest power is in justice and humanity to all those living within its fold." He promised that in exchange for their former subjection to Spanish rule he had come to "bestow upon the people of Porto Rico the immunities and blessings of the liberal institutions of our Government."

That event was seven years ago. The other day the public press printed a short dispatch that strike riots had broken out among the bread winners of the island and that the American flag was trampled upon by certain of the angry people. What does it mean?

Beyond question the people of Porto Rico are discontented, and they have the right to be so. Congress has not treated them with proper consideration. They imagined they were to receive the rights of American citizens, but these have been denied them.

Take the case of Miss Isabel Gonzales some time ago, a lady of position and culture. She arrived at the port of New York on an American vessel, direct from San Juan, and was detained at Ellis Island as a "foreigner" liable to become a public charge. When she was in danger of deportation to her native island her uncle enlisted legal services and by a writ of habeas corpus got her on the mainland. She had been treated like a foreigner from Turkey or China. Then she was taken before the United States Circuit Court and Judge Lacombe decided that she was an "alien." The case was appealed to the United States Supreme Court, which decided that she could land, but that Porto Ricans are neither Americans nor foreigners. They are like Mohammed's coffin.

A recent instance makes the condition even more ridiculous. A number of Porto Ricans went to the United States Commissioner and asked if they might be naturalized. They were told that they must first forswear their allegiance. They asked, "What allegiance?" The only allegiance they already had was to the United States, and it was not their desire to forswear allegiance to it but to declare it. Is it right that an Italian or a Turk can become a citizen of the United States and not one of our own Porto Ricans?

What is needed is that Congress

should pay some attention to its near colony. It should govern Porto Rico for the Porto Ricans, just as New Mexico is governed for its people. It should be raised to the rank of a Territory, with the promise of being later made a full fledged State. Nothing less is just and right.

**Nature
Studies**

In a lecture by Prof. E. Ray Lankester, lately published in London, the distinguished naturalist defends a somewhat new argument for giving the pre-eminence in the university curriculum to nature studies. He says that by his interference with natural laws of heredity and variation civilized man has proceeded so far in his interference with extra-human nature, as to produce for himself and the living organisms associated with him such a special state of things by his rebellion against natural selection and his defiance of nature's pre-human dispositions, that he must either go on and acquire firmer control of the conditions or perish miserably by the vengeance certain to fall on the half-hearted meddler in great affairs. It is, he says, practically certain that all epidemic disease could be abolished within a period so short as fifty years if the State cared to take the matter in hand and employ the means at the command of science. He would then have legislators educated in the sciences of nature, so that they will understand and appreciate the dangers and the remedies, rather than in the old studies. Professor Lankester seems to think that the highest study of mankind is nature; he hardly accepts Pope's notion that "The proper study of mankind is man," much less that of Plato, who said: "Trees and fields teach me nothing; men are my teachers." Plato was half wrong, but was he not right in thinking that, however valuable the study of nature, that of man, his history, his experience, his achievements, is the best and most profitable of all studies? Man has a brain of five or six times the bulk, in proportion to size, of any other surviving simian. The work of that brain is more valuable for study than

the anatomy of simian brains, and the culture of that big brain is more to be considered than all Pasteur's cultures of bacteria in sterilized soup. We do not join in Professor Lankester's fear that man is liable to be exterminated by his development out of ignorance and savagery. Indeed, thus far, the greater his interference with nature the greater the human population, and the bigger and finer the men.

**A Kansas
Disappointment**

Governor Hoch, of Kansas, is much disappointed over the decision of the Supreme Court of the State that the law for establishing a State refinery is unconstitutional. He says that if it is not constitutional to build it it ought to be. We think he is right; but the Constitution stands clearly in the way, as the Court decides unanimously. But a constitution can be changed. It takes only a very few years. It is a serious question whether the elaborate prohibitions of constitutions do not too much disturb the people. Governments get along very well without any written constitutions. It is not clear why a State should forbid itself to own or run a railroad or a refinery, as well as a school, or a hospital, or a penitentiary. To be sure, the plan of the Kansas reformers was a fraud on the Constitution, as the Court easily saw. The pretense was too flimsy. There was to be an unnecessary penitentiary established, to be a cover for the industry of the inmates in refining oil, the object being not the penitentiary, but the refinery. Under the Constitution the State could establish the penitentiary for penitentiary purposes; not a penitentiary for refinery purposes.

**A "Slump of
Conscience"**

In reply to those who have made Dr. Gladden's attack on "tainted money" an argument against the policy of the Congregationalists in giving *ad interim* duties to the Moderator of their National Council, Dr. Jefferson, of the Broadway Tabernacle, says that not only has it given public attention

to the denomination, but Dr. Gladden has been calling needed attention to the disgrace of ill-gotten wealth. While neither Dr. Jefferson nor ourselves agree with Dr. Gladden as to the refusal of "tainted" money for benevolent purposes, we find much to approve in his late address to the Christian Endeavorers in Baltimore last Saturday. He said:

"The one thing this country needs to-day is a clearing and toning up of the consciences of its citizens. The phenomenon known as graft is a widespread and deadly disregard of the primary rights of property, and the essence of it is the appropriation for personal uses of public property or of private property held in trust."

Very true, but we are not so sure that he is right when he speaks of "a general slump of conscience in financial circles and in political circles, in society and in the Church itself." We should not call it a "slump," but a clearer recognition of evils which have long existed, but which were not clearly seen. There is rather an awakening of conscience than a slump of conscience. We see things to be wrong that we did not see to be wrong before. The faculty of seeing right and wrong becomes more and more developed. It may be that one of these days we shall come to hold that the exclusion of immigrants, or the wall of a protective tariff, is selfish and sinful.

The Sick Sultan The Sultan is reported sick in the Yildiz Kiosk, and we do not wonder. He has suffered and done enough to shatter the strongest man's health. We should think that after all the massacres of his subjects he would feel that he was attacked by as many bat-winged ministers of justice as were those who, as Hood tells us, avenged the crime of the Eisenhutte. Just now Russia does not disturb the Sultan as much as she did, and he can dally about the proposals for a railroad and irrigation works in Mesopotamia, and he can still set Germany and Great Britain against each other; but nothing can he do in the much more important trou-

bles that beset him in Arabia. It is essential to his position that he hold control of Mecca. That makes him the head of the great Moslem world. But the Arab hates the Turk, or despises him. Both are building-stones in the grand temples of the Moslem faith, but Arab is precious marble, while he calls the Turk brick of crumbling clay. Now the disturbance has risen to the level of a real revolt. A large part of Southern Arabia has thrown off its allegiance, and Sana'a is captured, and Mecca will next be threatened. The Moslems the world over prefer Arabs to Turks, and so do Christians. There is more hope for civilization in the Arabs than in the Turks. There is a certain danger that Germany may offer her aid to Turkey, but until the Herreros of West Africa are subdued Germany is likely to avoid war with other wild tribes, and it would be foolish for England to interfere.

A curious story, which we may suppose true, for it is copied from the *Rouskoïé Bogatsvo* for April by the *Paris Temps*, tells how Russian honor was once saved by Japan. It was in 1887 that at Korsakof, the capital of Sakhalin, it was decided by the "high society" to hold a celebration of Pushkin's fiftieth anniversary, making it a national and literary jubilee. Everything was prepared, vodka, oration, prayers, amusements, when at the last moment it was found that one essential was lacking—not a copy of the complete works of the poet could be found on the island. The organizers were in despair, but the providence which cares for idiots, drunkards and fools did not fail them. The Secretary of the Japanese Legation, M. Suzuki, came to their aid and kindly consented, at their request, to loan them his beautiful and rare edition of the works of the author of "Eugène Oréguine."

Those who have been fearing or hoping that Professor Briggs will pass through the Protestant Episcopal to the Roman Catholic Church need feel no anxiety on the subject. He is not, we know, in the least danger of doing so. It is wild talk.

Insurance

Women as Life Risks

THE attitude of the Home Life toward women as life risks is indicative of the modern tendency to accept them freely by the best life insurance companies. Formerly they were regarded as undesirable risks, as an extra hazard was considered to attach itself to them. A recent review of comparative statistics of male and female mortality has been considered by experts to show that the extra hazard assigned to women is more than offset by the fact that as a class they are less inclined to excesses. They are also freer from exposure, strain and pressure than are their masculine fellows. In the insurance of women, however, social position and general surroundings are, generally speaking, carefully considered not only by the Home Life but by all conservative companies. The insurable interest is for the most part vigorously insisted upon. If a married woman has an income of her own, either from her vested estate or from her own industry, which income is devoted either in whole or in part to the general family fund, it is clear that the husband as a recipient of a portion of such income has a vested insurable interest in her life. Widows with dependent children clearly have undisputed insurable interest, but the placing of insurance upon women of advanced age, whose policies are made payable to adult children of either sex, is not regarded with the smallest favor. In point of fact such policies are rarely if ever made binding.

The Weakening of Credit by Personal Surety

IN becoming surety, business men were formerly accustomed to regard the bond as merely a matter of form. They lightly assumed liability of this kind as a very remote contingency, even when the amount involved was a considerable sum. The custom of acting as personal surety came into existence before the advent of the surety companies now organized to undertake risks of this character. The

assuming of liability as a personal surety still lingers in some sections. There has lately been a pronounced reaction against this, however, in view of the fact that the existence of such liability curtails credit. The modern credit man is forced to scrutinize all conditions weighing for or against a debtor, and if a liability for personal surety hangs over a customer seeking credit of him he is bound to take cognizance of this, just as he would anything else affecting the finances of his customer that would be. Dispatches from Columbus, O., specifically mention a case where a merchant of that city sought to be relieved as surety on a bond because he found that the obligation thus resting upon him, perhaps thoughtlessly assumed, had tended to weaken his credit. The case is typical as showing the modern trend in commercialism. If a business man seeking credit found it impossible to obtain it because he had become surety on a bond the penalty of which was equal to or in excess of his total assets, he could not escape the knowledge of an assumption on his part of a real obligation, which might at some future time reduce him to bankruptcy if not to actual want. The sooner a sentiment in favor of corporate surety is created the better it will be.

SENATOR FREAR, of Wisconsin, is the author of a bill requiring the State to provide life insurance for all persons residing therein.

...The recently published experience of a certain casualty company sets forth the fact that the cost to the company of insuring a man between the ages of fifty and sixty years is a trifle over 15 per cent. greater than for carrying him before the age of fifty. Age thus becomes an important factor in accident insurance for the reason that when the half century is passed a man's power of physical resistance is weakened and as a rule his mental powers are rather more sluggish in action, all of which tends toward increasing the cost of covering the man of advanced years as a risk.

Financial

Devlin's Broken Banks

THE failure of the First National Bank of Topeka and of two allied banks in Illinois points once more to the risk incurred by those who deposit in a bank absolutely controlled by one man, especially if he is engaged in large ventures of a speculative character. It also directs attention to violations of the law which the Government is unable to prevent and for which the statutory penalties are inadequate. C. J. Devlin virtually owned these national banks. The one in Topeka was wrecked because he had borrowed from it about \$1,200,000, a sum nearly equal to its deposits. As the bank's capital was only \$300,000, it was forbidden by law to loan more than \$30,000 to one person. As Devlin was on the State Treasurer's bond for \$500,000, it was natural to expect to find the Treasurer depositing largely with his friend. It appears that Devlin thus had the use of \$547,000 of the State's money. The three banks seem to have been used by their owner as convenient reservoirs from which he could draw funds for carrying on his business in mines and railroads. Such a misuse of depositors' money cannot always be prevented or detected by the official examinations. The penalties provided are not sufficient for restraint. Depositors should not rely exclusively upon the law and the Comptroller of the Currency. They should be guided by their knowledge of the character and the projects of the men who control the institutions to which they intrust their funds.

A New Japanese Loan

ENGLAND, Germany and the United States are to take in equal parts the forthcoming Japanese loan of \$150,000,000 at 4½ per cent. As in the case of the preceding loan of the same amount, the underwriters here will be Kuhn, Loeb & Co., assisted by the National City Bank and the National Bank of Commerce. Berlin bankers asked for a share of that loan, but could not get it; this time they are admitted. They have learned since the beginning of the war not to place Japan's borrowings below Russia's. The

loan of last Spring (\$150,000,000) was secured by a lien upon the Tobacco Monopoly; the specific security for this new loan is to be a second lien of the same kind. The annual income of the Monopoly is about \$16,000,000, and the interest upon the two loans will be \$13,500,000. But the main security, of course, will be Japanese credit, which continues to be of a high character and is sustained by the excellent economic condition of the country.

It is proposed that cars shall run every 15 minutes on the electric line now under construction between Washington and Baltimore.

....The bank note circulation of the country amounted to \$495,719,000 at the end of the fiscal year, and the increase in twelve months had been \$46,484,000.

....In the statement of the Bankers' Trust Company published in our advertising pages last week a typographical error made the deposits appear as \$248,899,785.18. The correct amount is \$24,899,785.18.

....By a vote of 105 to 99, the Connecticut House has sustained the monopoly of the Southern New England Telephone Company in that State and rejected a bill allowing competition. The company recently reduced its rates.

....Our exports of automobiles have grown from \$948,000 in the fiscal year 1902 to \$1,895,000 in 1904 and \$1,876,000 in ten months of the current fiscal year. Imports, mainly from France, were \$1,446,000 in 1904. The tariff duty is 45 per cent.

....The list of railway companies that became insolvent in 1904 was very small. There were only eight short roads (744 miles in all), capitalized at \$36,069,000 in stock and bonds. In the first half of 1905, five small companies, operating only 270 miles of road, have been placed in the hands of receivers.

....Dividends announced:

U. S. Rubber Co., Preferred, quarterly, 2 per cent., payable August 15th.

Rock Island Co., Preferred, quarterly, \$1.00 per share, payable August 1st.

The Independent

VOL. LIX

NEW YORK, THURSDAY, JULY 20, 1905

No. 2955

Survey of the World

National Topics

Dispatches from well-known correspondents in Washington say that the President intends to call Congress for a special session beginning on November 10th in order that it may take up the railway rate question, and that his views as to the great need of legislation on this subject have undergone no change.—In the course of an address at the annual meeting of the physicians of Long Island, on the 12th, the President spoke of the importance of good medical work as the basis of success in the construction of the Panama Canal. Of the work now in progress on the Isthmus he was “glad to say” that it was “being admirably done.” It would “not be a failure.” Referring to the sanitary work done by our Government in Cuba, he said that better work had never been done for this country. The man who above all others was responsible for doing that work so well was a doctor who had gone “to the field as a soldier, the present Major General Leonard Wood”:

“Leonard Wood did in Cuba just the kind of work that, for instance, Lord Cromer has done in Egypt. We have not been able to reward Wood in anything like the proportion in which for services such as his he would have been rewarded in any other country of the first rank, and there have been no meaner and more unpleasant manifestations in all our public history than the feelings of envy and jealousy manifested toward Wood. And the foul assaults and attacks made upon him were largely because they grudged the fact that this admirable military officer should have been a doctor.”

General Wood is now in this country, having returned from the Philippines

to undergo a surgical operation.—Just before Secretary Root consented to re-enter the Cabinet, a friend in Cincinnati, J. H. Woodard, sent him a telegram asking whether it would “not be better to wait three years for the substance than to take the shadow now.” To which Mr. Root replied:

“My feeling is that the things one has an opportunity to do are substance and the things one tries to get are shadow.”

It is reported that Lloyd Griscom, now Minister to Japan, will be made First Assistant Secretary of State.—The Chamber of Commerce of Portland, Ore., in a long letter prepared by its President, William D. Wheelwright, urges President Roosevelt to take steps for negotiating a new treaty with China that shall provide not only for the removal of all annoying conditions attending the entrance of Chinese merchants, students and professional men at our ports, but also for “the admission during the next ten years of a number of male Chinese laborers that in any one year shall not exceed one-tenth of 1 per cent. of the population of this country.” It is asserted in this letter that there is much less opposition on the Pacific Coast to Chinese immigration than there was a few years ago, and that public opinion there as to this question is changing rapidly.

Mr. Bristow's Report on the Panama Road

After an investigation which has consumed several months, Joseph L. Bristow, formerly Fourth Assistant Postmaster-General, has submitted a report upon the Panama Railroad. It appears that the rail-

road company, now controlled by our Government, practically owns all the land on which Colon is built, together with extensive wharves at that port and at Panama. It operates a line of steamers between Colon and New York, using six ships, three owned and three chartered. Having considered the complaints as to high local rates, monopolistic traffic contracts with the Pacific Mail Company and two South American steamship lines, Mr. Bristow makes the following recommendations: that the road be continued as a commercial line, with an additional track, modern rolling stock, additional wharves and other improvements; that the rates for through business be made as low as the cost of the service and a fair dividend will permit; that the steamship line between Colon and New York be retained by the Government; that the exclusive contracts with the Pacific Mail Steamship Company and the two South American west coast lines be canceled "and the ports of Colon and Panama be opened to the use of all steamship lines on equal terms"; that the company establish a new line between Colon and the Gulf ports if this be not done within a reasonable time by private capital; that if the Pacific Mail Company withdraws its line between Panama and San Francisco some other company be asked to take its place, and that, if no other company desires to do so, the railroad company establish a line between Panama and our Pacific ports. A line to Gulf ports is needed because it is cheaper to move Mississippi Valley supplies for the canal by way of those ports than by way of New York. In traffic connections American ships should be favored so far as this can be done consistently with treaty obligations, but, upon the theory that the railroad is performing the functions of a canal, Mr. Bristow cannot see that it is practicable to discriminate in favor of American ships at the ports of Panama and Colon. The exclusive contract with the Pacific Mail Company was canceled on the 12th inst., after this report was completed. It was in the interest of the transcontinental rail-

roads.—Contractors will be invited by the Canal Commission to supply 2,000 Japanese, 2,000 Chinese and 2,000 Italian laborers before December 1st and for a term of 500 days. Thus the merits and capacity of each race will be tested. Service on the Isthmus will be made more attractive. A competent man has been employed to provide means for recreation, such as reading rooms, clubs, amusement halls and grounds for athletic sports.

The Stolen Crop Report

Owing to the disclosures which caused the dismissal of Assistant Statistician Holmes, of the Agricultural Department, all the official crop reports have fallen under suspicion. Many believe that information as to the wheat reports was sold to speculators. Tobacco growers express the opinion that the tobacco reports have been manipulated in the interest of the Trust's buyers. Holmes, who sold the cotton reports, has disappeared. It now appears that a complete statement of the evidence was not placed in the District Attorney's hands, and that his opinion, that there was not sufficient ground for the prosecution of Holmes, was based only upon what had been laid before him. The President desires that a most searching investigation be made, and he has placed the case in the hands of Attorney-General Moody, to whom, on the 12th, he sent the following letter:

"I most earnestly hope that every effort will be made to bring Holmes to justice in connection with the cotton report scandal. Please go over the papers yourself. The man is in my judgment a far greater scoundrel than if he had stolen money from the Government, as he used the Government to deceive outsiders and to make money for himself and for others."

A prominent cotton broker of New York, who was mentioned in the published report as having been interested in the purchase of Holmes's information, but mentioned without the support of trustworthy evidence, has demanded from Secretary Wilson a retraction. The Secretary says: "This is a quarrel among gamblers. I have nothing to take back." Regret is expressed in Washington official circles that the Secretary did not have Holmes arrested.

Philadelphia's District Attorney Mayor Weaver and those who are assisting him in the war upon Philadelphia's ring have discovered that District Attorney John C. Bell does not agree with them as to the course to be pursued. This will cause some delay. It was shown in court some weeks ago that Boss Durham and Senator James P. McNichol had been and were silent partners in the contracting firm of Daniel J. McNichol & Co., owning an interest amounting to eleven-twelfths. This is the firm to which were given the great ring contracts. Mr. Bell now admits that for two years past he has been counsel for Senator McNichol; that up to a very recent date he was preparing to defend McNichol in the civil suits which seemed to be impending; that he has also been acting as counsel for the Durham-McNichol firm; that he has large holdings of the United Gas Improvement Company's stock, and that he is associated in a law office with Joseph L. Caven, an uncle of the Caven who was recently arrested and indicted for his connection with the ring contracts. It is also asserted, and not denied, that he and his relatives were interested largely in real estate favorably affected by the ring's Torresdale Boulevard. After the arrest of Councilman Caven and Engineer Hill, and the preliminary hearing which disclosed the evidence against them, he assisted in procuring the indictment of both, for offenses which were not clearly connected with what is regarded as a conspiracy in which Durham, McNichol and others were the chief actors; but when he was asked by the Mayor, with the approval of the latter's advisers (Elihu Root, Wayne MacVeagh and Judge Gordon), to procure the indictment of Caven and Hill and "certain other persons" (Durham and McNichol) for conspiracy to defraud the city, upon evidence in the Mayor's possession, he declined to do so, saying that the other persons must first be arrested on a charge of conspiracy, be heard, and be held for the grand jury by a magistrate. His attitude has been the subject of much correspondence between him and Judge Gordon. This has been published. Judge Gordon very severely criticises Mr. Bell, pointing out how

favorably his policy affects "the real and potent criminals." Some suggest that a special District Attorney should be appointed to do the work which Bell avoids. The Mayor attended a meeting of his advisers in New York on the 14th, and it is predicted that the leaders of the ring will soon be arrested. John W. Hill, recently Chief Engineer of the filtration works, has been indicted twice for forgery and falsification of records. Robert C. Hill, chief of the Bureau of Building Inspection, has been removed because he used the power of his office to "favor some [the members and friends of the ring] and to oppress others." Two members of one of the ward committees go to prison for nine months because they padded the voting lists. It is said that 50,000 votes have already been accounted for by the detection of fraudulent registration from cheap lodging houses.

Judge Calhoun's Mission to Venezuela Judge William J. Calhoun, of Chicago, has been appointed by the President a Special Commissioner to make a thorough investigation in Venezuela as to all questions affecting the interests of the United States. In April, 1897, Mr. Calhoun, who had been practicing law in Danville, Ill., was sent to Cuba as the special representative of President McKinley, to inquire as to the death in prison of Dr. Ricardo Ruiz, a naturalized citizen of this country, and also concerning Spanish rule and the condition of the people. His first report was received on May 15th. Two days later Mr. McKinley sent to Congress a message asking for an appropriation of \$50,000 to be used in Cuba for the relief of destitute Americans there. It is said that the information given by him to Mr. McKinley upon his return was very influential in shaping the latter's policy with respect to Spain and the island. Afterward Mr. Calhoun was for two years an Interstate Commerce Commissioner. It is understood that he goes to Venezuela with the knowledge and consent of President Castro. He will inquire as to the complaints of American companies concerning the conduct of the Venezuelan Government toward them, and undoubtedly will report

as to the seizure of the asphalt properties, the character of the courts and the agreement with certain European Powers relating to the payment of the country's foreign debt.

Charleston Naval Inspectors Reinstated

The new Secretary of the Navy, Mr. Bonaparte, has revoked the order by which his predecessor, Mr. Paul Morton, at the request of a contractor, transferred Civil Engineers J. C. S. Walker and F. R. Harris from the Charleston Navy Yard to other stations. They were inspectors of work in progress at Charleston, and the contractor asserted that they were too exacting. There was much gossip about Secretary Morton's order, because it was reported that it was due in part to political influence after Admiral Endicott, Chief of the Bureau of Yards and Docks, had, as the official statement now says, rejected the contractors' application and complimented the two officers "on their vigilance and zeal." In his report to the President, Secretary Bonaparte, referring to an investigation made by Assistant Secretary Darling, shows that the contractor's work (he was building a dry dock) was in need of "vigorous inspection." The two engineers were "vigilant and conscientious in the discharge of their duties," and they "held the contractor up to the specifications." He had repeatedly tried to get rid of them. At last he was successful. Of Secretary Morton's order Mr. Bonaparte says:

"Whatever might have been the merits of such action if taken spontaneously or under other circumstances, I am compelled to look upon it as unfortunate when thus induced and under the circumstances actually existing. In my opinion its moral effect would be probably undesirable upon contractors for Government work and supervising officers, and, on the whole, unsatisfactory both within and without the service."

In the present instance, he continues, it is liable to serious misconstruction. He then refers to evidence, "corroborated rather strongly by undisputed facts," that the contracting company's officers sought, some weeks before going to Secretary Morton, to secure the removal of the two inspectors by "political influ-

ence." There is not "a scintilla of proof" that if such an attempt was made it was successful, he adds, but the Secretary's order "unluckily appeared to verify the boastful talk of some of the company's officers."

Decision Against a Publishers' Association

An interesting decision has been announced by Judge Ray, of the United States Circuit Court, at New York, in the action of the publishing houses of Charles Scribner's Sons and the Bobbs-Merrill Company for an injunction to restrain the department store of Macy & Co. from selling copyright books at less than the retail price fixed by the American Publishers' Association. The court dismisses the complaint and severely criticises the association, holding that it exists in violation of the Anti-Trust law. The "declared object and purpose of this combination," Judge Ray says, is to "fix and maintain the retail price of books; to refuse to furnish or sell any books to any dealer who does not maintain such prices; to compel all publishers and dealers in books, in practical effect at least, to come into the combination and enforce and maintain these prices, or be blacklisted and driven from the business, and to drive out of the business of general publishing and book selling all who refuse or neglect to maintain these prices":

"When all publishers of and dealers in copyright books—and nearly all new books are now copyrighted—combine to exact a fixed arbitrary price, etc., the readers of books become powerless, if they would read at all, not because of the monopoly granted or sanctioned by the Government in granting the copyright, but because of the new monopoly (the conspiracy of monopolists) created by the agreement and combination of these monopolists; one that is forbidden and denounced by the act of July 2d, 1890."

If the decisions in the Northern Securities and kindred cases are to be respected, he adds, this combination is illegal; it is seeking to enforce against the defendants "an unlawful agreement to which they are not parties and by which they have not consented to be bound in the selling of books of which they are the absolute owners."

**Progress
in Cuba**

Contracts have been awarded for the construction of an extensive system of interurban electric railways, radiating from Havana. One line will cross the island, to Rosario. At the beginning about 125 miles of road will be built. The lines will be used for freight as well as for passenger traffic.—A remarkable review of Cuba's recent progress, with a comparison of conditions under Spanish rule with those to be observed under the present Government, has been published in *Espana Economica y Financiera* at Madrid. Cuba's budget, it is pointed out, is now \$23,370,000 and exceeds but slightly the average from 1888 to 1893, but in those days it included \$7,000,000 for the army and the navy and \$11,000,000 for interest on the debt. The number of primary public schools is now 3,605, against only 904 under the colonial *régime*, in 1894, and the number of pupils in attendance has increased from 36,306 to 120,000. For wagón roads \$2,000,000 is appropriated; "the Spanish administration left that work to the producer's machete." Independence has given the island 435 miles of the Central Railway, for which the Spanish administration planned for a quarter of a century. "During the last period of our dismal rule the trade balance was regularly against the island;" now it is largely in favor of it. The sugar output is rapidly increasing:

"Yellow fever was a chronic reproach to our colonial administration. A few months of hygiene and sanitation during the American intervention did more for the island than the power of Spain had done in four centuries. In 1880, under colonial *régime*, there were in Habana 7,942 deaths, or 39.94 per thousand; 645 deaths were from yellow fever, 446 from smallpox. In 1901, under Yankee intervention, the mortality had been reduced to 5,720, or 22.09 per thousand. There were only 18 deaths from yellow fever and none from smallpox. These comparisons are far from flattering to our colonizing methods and to our public men. In order that Cuba might liken herself to the great modern nations in hygiene, instruction, Governmental mechanism, industrial development, etc., she had to escape from our sway. Had she continued subject to Spain, she would still be afflicted with the troubles from which she suffered before the revolution."

—Governor Nuñez has publicly an-

nounced his departure from the Liberal Fusion party, from which he has really been separated since Governor José Miguel Gomez was nominated by it for the Presidency. He returns to the Nationalist party, which, he says, will probably make no nomination, but will support President Palma, thus insuring his re-election. The Governor has suspended from office Mayor O'Farrill, of Havana, owing to the results of an investigation concerning expenditures, and will recommend to the President that he be removed.

**Various
Items**

Mr. Balfour's promised bill for the equalization of the Parliamentary districts especially excites the Irish members. The English Liberals are ready to oppose any measure of redistribution of seats now at the tail end of the session, because they have no faith in the honesty of the measure. Mr. Balfour proposes that the number of seats remain as at present at 670, the standard unit of population, being raised from 54,000 to 65,000, which gives a much larger House of Commons than is our national House of Representatives and a much smaller unit of representation. But the scheme does not propose a uniform basis of population, but retains boroughs with a population as low as 18,500. The result will reduce the Irish representation by 22, while England will gain 17 seats, Wales 1, and Scotland 4, thus balancing the 22 lost by the reduced population of Ireland. The Irish, of course, object bitterly, claiming that their membership does not depend on population, but was fixed at 100 by the Act of Union. It may be this proposition which has called forth a flag of truce from the Belfast Orangemen addressed to the Irish Catholics. It declares that the people of Ireland have a common interest, whatever their faith, and that the Castle Government is self-condemned, and that both English parties are untrustworthy, whether Tories or Liberals, and that it is time for all patriotic Irishmen to join forces in self-protection. This manifesto is signed by a Member of Parliament for Belfast and the President of the Independent Orange order.—The King of Sweden

having refused to allow one of his sons to take the throne of Norway, the crown has been offered to Prince Charles, of Denmark, who married a daughter of King Edward of England, and the plan is favorably considered. The Emperor William, on an excursion on his yacht, received a visit from King Oscar of Sweden, but no developments have transpired, except that the Emperor has bestowed on the King of Sweden an honorary rank in the army.—The French Royalist exiles, in whose behalf the Amnesty bill was passed by the Senate, and would have been passed by the Deputies but for an insulting speech by one of its friends, will return to France, having been pardoned by President Loubet. They had been condemned for the revolutionary conspiracy of 1899. The most noted of them is Paul D  lour  de.—The difficulty between France and Germany over the Morocco situation, which led to the retirement of M. Delcass  , has been settled by the agreement by France to enter the international conference on Morocco, with conditions first agreed upon with Germany, but not yet published. It is expected that Great Britain, Italy, Spain, Austria and the United States will join in the conference.—An extraordinary petition, signed by 33,000 natives of South Africa, has been sent to King Edward. It protests against the unjust treatment of natives and instances discriminating and injurious legislation, such as the Morality act, which does not protect native women; the infliction of the lash on natives in all cases of assault on whites; the infliction of the death penalty on natives in all cases of attempted assault on white women, while brief terms of imprisonment are provided in case of white men making similar assault on native women; prohibition of natives using the sidewalk of streets; the exclusion of respectable natives from first and second class compartments on railways, and the prohibition of natives purchasing land or holding public meetings in the Transvaal Colony.—The refusal of Japan to allow China to take part in the peace conference was expected, and it is said was suggested by Russia to create ill feeling.—The Pope has suffered very much from the exceptional heat, and the report is revived that

he will leave the Vatican for a summer retreat at Castel Gandolfo.

Witte as Peace Envoy

Count Muravief has declined the position of peace envoy, and his place has been taken by M. Witte, President of the Council of Ministers. The explanation given is that Muravief's health will not permit him to go, but the real reason seems to be that the faction which desires peace had got the ear of the Czar, and persuaded him that Muravief would be impracticable and offensive, partly on account of the untimely language uttered by him at The Hague, when, as presiding over The Hague Court, he made a bitter attack on the Japanese. M. Witte is an advocate of peace, and opposed the war from the beginning. He is the ablest statesman in Russia, but has been devoted to internal progress rather than to military extension. He is 56 years old and sprung from the humblest rank, by native ability and success. His first success was in railroad management, and it was he that in the last war with Turkey saved the Russian army before Plevna by breaking up the railway congestion. Then his advance was rapid. He was put in charge of the railroads, secured the ownership of those in European Russia by the Government, and built the Siberian Railway. He was made Minister of Finance, and doubled the revenue due to indirect taxes. He made alcoholic liquors a Government monopoly. He has been the wisest counselor in all internal improvements, being careful for the interests of the people, and is regarded as with the Liberal party, altho it is not clear that he believes Russia ready for representative government. He has been bitterly opposed by the military and Ducal party, who know him to be honest; and they succeeded at last in shelving him into the harmless position of President of the Committee of Ministers. But when intelligent action is required it is necessary to call him, altho it is not probable that the Czar is much inclined to him. It seems that his enemies have been quite willing to have him go as peace envoy, partly because it will remove him for some months from aiding the Liberal movements, and partly because it is believed that the humiliating conditions of

peace which he may be obliged to accept will destroy his influence on his return. But he is an able politician, and seems able to care for himself. There is absolutely no trustworthy knowledge as to terms to be demanded by Japan, or those that will be accepted by Russia. Russian journals are placing great hopes that Germany and France will support her in resisting excessive Japanese claims.

Position of the Armies

The position of the armies is thus given by the *Paris Européen*: The left wing of the Japanese army is under General Nogi, the hero of the capture of Fort Arthur, whose soldiers made such an extraordinary rush around the west of the Russian army in the battle of Mukden. It occupies the valley of the Liao and its affluents, the Taliao and Chaosi, and its advance guard appears to be about Kintsiatun. The center army is under General Nodzu, with General Oku in reserve, and holds the railroad and the Mandarin Road, and its advance extends to the towns Sunchan, Chantufu and Kai-yuen. The right wing holds the route from Kai-yuen to Kirin, and is under the command of General Kuroki, while General Kawamura holds a force further to the east in the mountains, in the valley of the Sungari and its upper affluents. These five armies are under General Oyama, and they include not less than 400,000 men; and to them may be added bands of Chinese Chunchuses, in the pay of Japan, which keep in contact with the Russian advance posts. There is a sixth army of 100,000 men, under General Hasegawa, which landed at Gensan, and was at last accounts moving in the north of Korea, where its narrow line extends along the sea nearly to Vladivostok. The purpose of this army is to invest that port by land, while the Japanese navy invests it by sea, and to cut the railroad connections with Harbin, and the route to Ninguta.—The location of the Russian army is less certain. The main center seems to be in the region of Gunshulin and Kotsiatien. To the west the Second Army of General Kaulbars blocks the route from Sinminting.

In the center the Third Army, under General Batianof, holds the railroad to the south of Kotsiatien, and protects the route from Chantufu to Harbin. To the east General Kuropatkin protects the route from Kai-yuen to Kirin. Further south is a sort of semicircular advance line, held by General Mitchenko in the west along the valley of the Taliao, and on the east by Generals Rennenkampf and Samsonof, with Cossacks and infantry. General Linievitch, in command of the entire forces, probably has one or two army corps in reserve, as in the battle of Mukden. The entire force can hardly exceed 250,000 men. Since the threatening skirmishes of two or three weeks ago there have been no special conflicts, and it is likely that the rainy season, which has come on early, may delay movements until the peace negotiations begin in August, and there may then be an armistice. But the serious advance likely is in the extreme east, with General Hasegawa's army threatening Vladivostok and Ninguta, and they may be aided by the Fifth Army under General Kawamura, which has made serious advance in the mountain region from Kirin to Omoso. Already we know that Hasegawa's army has pushed the Russian force of 16,000 men under General Andref across the bordering Tumen River. The Russian situation seems desperate, as Linievitch, with his inferior, if not dispirited, force, cannot detach any army to meet the advance of Hasegawa. The purpose of the Japanese seems to be to obtain a foothold in Russian territory on the mainland, investing Vladivostok, while seizing the island of Sakhalin, with a view to favorable conclusions when the peace envoys meet at Portsmouth. Indeed it is reported that far north the mouth of the Amûr River is threatened by a Japanese force.

Disturbances in Russia

The most tragic event of the week has been the assassination of Count Shuvalof, Prefect of Police at Moscow. While a number of persons were presenting petitions the assassin entered the audience hall and deliberately shot

him and was arrested. He was one of the better class of Russian officials. There has been a manifesto published stating that he was executed by central orders because of his repressive measures at Odessa, and because he came to Moscow to carry out the orders of Trepoff.—The ruin at Odessa is said to be irreparable, and the losses have been estimated at 40,000,000 rubles, while 500,000 people have lost their livelihood by the destruction of factories, etc.—A multitude of statements are made as to revolts of peasants and even of troops. Near Lodz some soldiers complained of their food, and a captain shot their spokesman dead, which resulted in the calling of other troops to restrain the malcontents. Part of a regiment stationed at Lodz mutinied on Monday and killed an officer, and the mutineers were arrested. The city is in a state of siege, and has to contribute \$1,500 a day to support the soldiers quartered there. In Warsaw there were three bloody encounters with striking shoemakers, and twenty persons were killed or wounded. It is anticipated that the German Emperor may give more aid to the Czar by stationing troops on the Polish border. At Minsk many persons have been wounded by Cossacks in a general strike. Martial law has been proclaimed in Tiflis. Many have been arrested and bombs have been found. At Batûm business is at a standstill, and banks and shops are closed. From Odessa it is reported that severe measures have been taken to repress the unruly peasants in the Government of Kherson, and 1,060 arrests have been made, and the prisoners were terribly beaten by Cossacks. Disorders are reported from Kharkoff and Kursk. It is said 100 kilograms of dynamite were found in the

cellar beneath the imperial apartments in the castle near Moscow which the Czar was expected to occupy. Indeed such plots are frequent, and disturbances are so general as to be very alarming. There is likelihood of severe famine in Northern, Central and Eastern Russia, as crops have failed, and the misfortune is increased by the call to all able bodied men to join the army. In many villages the women have marched in bodies to the police stations, which are the temporary quarters of the Reservists, and demanded that their husbands be restored to them. The Government is doing nothing to relieve the distress, despite the repeated representations of the zemstvos.—Notwithstanding that the police authorities have caused announcements to be proclaimed everywhere that the meeting of the delegates from the zemstvos will not be held, it is determined that it shall be held in Moscow and represent all Russia. There was a meeting of the Executive Committee of the joint bodies in Moscow last week. An officer was sent to demand the dispersal of the committee, but the delegates refused to obey, regarding the order as illegal, whereon the delegates retired. Delegates are beginning to arrive in Moscow, and the Executive Committee has drawn up a program for approval, which condemns the scheme of political reform drawn up by M. Boulyguine as unsatisfactory, and considers what measures are necessary to realize the unanimous aspiration for a free form of popular representation. It is believed that the authorities will not venture to interfere with the proceedings in which many of the wealthiest and most influential Russians will take part.

Is It Paul Jones's Body?

BY PARK BENJAMIN

I.

PARTLY, I suppose, because for a long time past I have been making a close study of the voluminous memoirs, letters, etc., left by John Paul Jones, in order to reach an appreciation of his real place in our naval history, and partly because my professional work requires constant criticism of investigations in physical science, THE INDEPENDENT has asked me for comment on the article of Dr. Papillault published in its columns last week, concerning his identification of the body lately exhumed by Ambassador Porter. Until the publication in full of the official document upon which the Government has acted in according recognition to the remains, and which Professor Hervé says is to be "deposited in the national archives at Washington," any final expression of opinion would be obviously premature; but, inasmuch as Dr. Papillault himself invites judgment ("I am going to try and put before the reader as clearly as possible so that he can judge for himself, *with all the facts before him*, just what we have proved"), I venture the following provisional criticism, and as a present conclusion simply submit the desirability of the speedy publication of the complete detailed report.

II.

Commodore John Paul Jones, of the United States Navy, or Vice-Admiral John Paul Jones, of the Imperial Russian Navy (not Rear-Admiral in either navy), died suddenly in Paris on July 18th, 1792. He was buried in the Protestant cemetery, inclosed in a lead coffin, for the reason, as stated in a letter by his personal friend, Colonel Blackden, dated a few days later, "that in case the United States . . . should claim his remains they might be more easily removed." His funeral was a public one. It was attended by a committee of twelve from the National Assembly then sitting, which went into mourning, and a eulogy was pronounced over his grave.

An abortive attempt to reclaim the body on the part of the United States appears to have been made in 1851 by Col. John H. Sherburne, who was authorized by the Secretary of the Navy to go to France in the frigate "St. Lawrence" for that purpose. Rear-Admiral Erben, then a midshipman on that vessel, says that it was the understanding at the time that Sherburne's failure was due to the interposition of Jones's relatives, then living in Scotland, who threatened prohibitive legal proceedings. There was subsequently a rumor that these people had found the body, removed it to Jones's birthplace and there buried it in an unmarked grave, to prevent repetition of the effort to remove it.

To the knowledge of the place of interment and of the lead coffin are to be added the further facts that Jones was 45 years of age, 170 centimeters in height and had dark hair. No other physical data useful for present identification of the body without extraneous and inferential aid appear.

Nothing in this inquiry is more remarkable than the total absence of identifying marks or objects in or upon the coffin. There was no plate, not a written word, no recognizable garment and not a trinket. It is necessary to believe, therefore, at the outset, that this man whose celebrity was notorious, who was the friend of many of the leaders of the French Revolution, who was honored by national mourning, and whose body it was supposed the United States would soon exhume, was nevertheless interred with no more certain marks whereby it could be known than a pauper's corpse thrust into the Potter's Field. It must further be believed that altho Jones's sister, Mrs. Taylor, one of the two beneficiaries under his will, came to Paris within three months after his death to settle his affairs, no record which can now be discovered was made or transmitted by her to her descendants of the actual location of his grave. The later

building over of the cemetery ground might have destroyed his headstone—if he had any—but ignorance and absence of record in the premises, if such be the fact, is noteworthy when it is remembered that Mrs. Taylor, her sister and their posterity were claimants against us for Jones's prize money for fifty-six years, and finally got \$50,000 in full of all demands only in 1848.

The reference to the mark like a J found on the bag containing the hair, which, like J's in general, especially the script character, looked like a P when turned upside down, seems inconclusive. That any one should select so cryptic a symbol for the specific purpose of identifying the body is hardly conceivable. That Jones ever used it (as suggested) as a monogram, there is no evidence, and a monogram which has to be turned upside down to reveal its constituent letters is not only phenomenal, but in the present instance seems to prove too much. There is no mark easier to make accidentally or, as the school copy books show, with the minimum of skill or intention than the simple J hook, and besides there is nothing to prove that the fabric having the supposed mark ever belonged to Jones or formed any part of his apparel.

It is not the presence of such a mark as this on a scrap of cloth, but the absence of marks on Jones's actual body (for Dr. Papillault records none and apparently found none), which of all direct facts is here the most significant. Jones was wounded. In the draft of an angry and bitterly complaining letter to the French Minister of Marine written four months before his death, he says:

"M. de Sartine . . . did not say to me a single word nor ask me if my health *had suffered from my wounds* and the uncommon fatigue I had undergone."

The writer of the authoritative biography published in 1830, for which Jones's niece then living had furnished the material, says:

"It is known as I am assured that he was once severely wounded in the head and he underwent great suffering at several times from violent injuries received in discharging his duty . . . but . . . he never incised his wounds in any letter or journal"

save in the draft above quoted. Surely it is nothing surprising and even to be expected that one who, as a boy, lived the hard life of a merchant sailor, and who, as a man, took part in two most bloody fights, besides countless small frays afloat, should, as he says himself, have wounds; but is it not singular that upon his body, of which, to quote Dr. Capitan, the "skin, hair, muscles, every part, in a word, is in a wonderful state of preservation," no trace of any wound should be found?

Of course, under existing conditions, recourse follows to contemporary portraits. The living man depicted cannot necessarily be now recognized in the ancient body and so science invades the field with compass and calipers.

In 1787, not long before his unhappy connection with the Russian Navy, a bust of Jones was made by Houdon. It became well known, as Jones distributed eight casts of it among his friends. It appears to be the only bust referred to by him in his letters. Upon a reproduction of it Dr. Papillault's six measurements have been made. Five of these are vertical from forehead to chin, and while as between body and bust none vary more than two or three millimeters, two (from line of hair demarcation on the forehead to chin-point, and from mouth-opening to chin-point) are precisely the same! All this, to say the least, is amazing and suggests questions.

(a.) If a bust which gives only the contour of a living face has two dimensions identical with a face which has become reduced (to quote Dr. Papillault) to "a skeleton covered with tissues, in this instance hardened with alcohol," why does not the coincidence logically prove not identity, but non-identity? For, if the hard, woody integument now measures the same as the bust, manifestly if it were changed to living tissue its measurements should be different from those of the bust. Measurements which are the same when two objects are in different physical conditions may well prove to be entirely different when the objects are in like physical condition. Jones had not been dead 113 years when Houdon's bust was made, and if, as Dr. Papillault thinks, Houdon made exact measurements from his subject, he cer-

tainly did not take them from his mummy.

(b.) The Houdon bust was made some five years before Jones died. Do not facial changes frequently occur in men passing from 40 to 45; and does not the line of demarcation of hair and forehead commonly recede? Yet this line is here taken as a datum. It seems necessary to believe (despite that the hair of the body is "thin above the temples") that the line remained fixed for the whole five years, since the distance from it to chin-point on the body (age 45 years) and bust (age 40 years) is identical.

(c.) So also of the chin, which most people imagine shortens from one cause or another (say teeth "somewhat worn," as those of the body are reported to be) as age creeps on. This also, we must believe, had the same length at 40 to 45 years, and retains it even now after a century's entombment.

(d.) The Houdon bust is of course an artist's medium for conveying to others his impression of the appearance of the living subject. As Dr. Papillault well says, "he devotes his attention to catching the expression of the face and getting a likeness." Therefore he modifies—heightening or lowering—depicted features as his artistic instinct dictates. Why then should a portrait bust made by an artist be deemed a trustworthy standard to prove exact physical measurements—as if it were a death mask even? Is nothing to be allowed for idealization? Five of Dr. Papillault's measurements could as well have been made on a profile portrait of Jones by Mr. Sargent, if one existed, but Mr. Sargent might reasonably be astonished if he found his marvelous mirroring of the "human face divine" subjected to the millimeter rule in order to establish somebody's identity.

(e.) No proof is submitted that Houdon habitually measured his subject and reproduced facial dimensions exactly. He made many busts of persons—of Washington for instance (see the old postage stamps)—whose countenances are much better known than that of Jones. It is not shown that the bust and life measurements of these others always coincide. It is easy to see that they do not. People familiar with Houdon's work classify him

as an idealist strongly devoted to the antique.

Another bust of Jones is alluded to by Dr. Papillault as also made by Houdon, but as to the measurements of this he is wholly silent. He does not, as in the case of the bust already noted, "feel that this is a likeness." The omission of all metrical data derivable from this second and apparently earlier bust—of which I have so far been unable to find any record in Jones's papers—is sure to excite question. Did Houdon make precise measurements of Jones in producing bust No. 2 and not in producing bust No. 1? Was he not seeking a likeness in bust No. 1 as well as in bust No. 2, and if certain exact measurements, as Dr. Papillault maintains, are necessary to likeness, why, if such is the case, did he not make them in one instance as well as in the other? If these two busts were "surely made at widely different periods," would not their measurements, if different, indicate change in the subject? Are their measurements the same or not? Would it be remarkable if the measurements of both and of the body all coincided—and what deduction follows? Perhaps after all everything is sufficiently answered in Dr. Papillault's naïve remark, "one was evidently far more valuable for my purpose than the other." When an investigator hunts for facts "in favor of the thesis I am sustaining" he usually gets them, or convinces himself to that effect; but, alas for the inductive method and the questioning of nature when undertaken in this spirit!

The Houdon bust is, of course, not the only authentic likeness of Jones. In 1787 Congress awarded him a medal, the dies for which Jefferson seems to have had cut in Paris, but for the striking of it Jones apparently paid. The execution of the portrait thereon is admirable. It is in profile, like yet unlike that of the bust. It does not appear that any measurements were made by Dr. Papillault of this portrait or any comparisons drawn with it.

Earlier still another medal of Jones was made in wax by a French artist, Renoud, which Benoit André (who prints a picture of it in apparently the first published autobiography of Jones

(1798), says was produced under Jones's own eyes. No measurements of that portrait seem to have been made and no deductions reached.

Whether a *corpus delicti* can be proved as a fact—assuming this for the moment to be a case of homicide—by six measurements of a Houdon bust I leave to the legal fraternity, as also the question of whether such evidence is probably competent, in that it certainly excludes the possibility of any other body existing having sufficiently near dimensions also to be considered that of the subject copied. Dr. Papillault essays to fortify himself by pointing out that of one hundred bodies of Parisians measured by himself several years ago none had the same face length as the Jones bust, or present body. Of what possible relevancy is all that? *Non constat* that he might not have examined a thousand bodies or more out of the possible millions and said the same—or calipered the physiognomies of all the loungers from the Madeleine to the Grand Opera House with like result. Something perhaps—though little—might have been argued if he had measured the faces of a hundred Scotchmen from the vicinity of Jones's birthplace—but why Jones's plainly North British visage should be compared with that of a random lot of Parisians, 95 per cent. of which did not have brown (and hence did have probably black) hair, passes any ordinary intelligence.

Dr. Capitan's report is for the physician and not for the physicist, therefore in lieu of criticism I can only offer what may aid others better qualified to do so.

In his letter to Mrs. Taylor of August 9, 1792, Jones's intimate friend Blackden gives the details of his last illness. He says that Jones "was not in good health for about a year, but had not been so unwell as to keep house. For two months past he began to lose his appetite, to grow yellow and show signs of the jaundice for this he took medicine, and seemed to grow better; but about ten days before his death his legs began to swell, which increased upwards, so that two days before his exit he could not button his waistcoat, and had great difficulty in breathing."

At this time Jones's troubles, grievances and anxieties were rapidly accu-

mulating. He was without employment—Russia had dismissed him with promises never fulfilled. Sweden had not welcomed him to her service. The *ancien régime* in France was being swept away, and his hope of wearing an admiral's flag on a French war ship seemed ever fainter as Citizen Sans-Culotte rose to the quarter-deck. The American war had long since ended.

The Russian scandal had embittered him—France and the United States were in arrears in his prize money. His business ventures had been unfruitful. His pride had been lacerated by the repellent treatment he had encountered from politicians—and his wounds were adding their misery to that of his progressing disease.

To him sitting alone in the second story parlor of Dobecque, bailiff, in the Rue de Tournon comes Blackden to tell him in his blunt British way that his condition is perilous and that he should make his will. The notaries arrived at about eight o'clock of the July evening. He dictated his brief testament in formal legal terms, and then a schedule of all that he had. There was tragedy in the seemingly dry enumeration, for it summed up all his claims and grievances, bringing them one after another in close succession to his mind. It was an epitome of his woes.

After the notaries left him he walked into his bedroom, and a few minutes later—when his physician came—he was found as he had fallen, lying dead, face downward on the bed, with his swollen feet on the floor.

Dr. Capitan in the body which he examined finds "the heart normal and the liver scarcely affected."

III.

Concerning identification by bust measurements in general: A book has recently appeared in which are collected all known portraits of Julius Cæsar, including the busts generally regarded as authentic. While all exhibit the keen, hawklike visage of the Roman, it needs but little examination to see how each ancient sculptor modified the features to heighten resemblance. If, despite the historic incineration, a body were to-day found and claimed to be that of the con-

queror, it would, I fancy, puzzle the student to say which bust should be measured as a standard—or, on Dr. Papillault's theory that likeness depends on exact measurements, to account for the obvious variations in face measurements which they all show.

And concerning another and recent identification: A large piece of linen preserved in a church in Europe has for centuries been venerated as a sacred relic of the Saviour. It has not long since been subjected to thorough scientific examination by French physicians, who have published an elaborate and detailed report. The fabric exhibited discolorations having the plain shape of a human body, which showed marks of scourging and, as alleged, prints of even the peculiar leaden slugs on the Roman whips. Other stains were pointed out as corresponding to effusions from the crown of thorns and from the bodily wounds of crucifixion. Chemical theories are evolved to account for the shadowlike figure actinically reproducing itself on the fabric, and experiments were made to show that, in fact, a body by its exhalations acting on the embalming spices wherewith a similar sheet was saturated could in a sense photograph itself. The physical and chemical facts developed were far more numerous, far more scientifically deduced and far more impressive than the data given by Dr. Papillault.

Any one accepting the premises that

this sheet was actually removed from the empty sepulchre and has maintained its identity ever since will, I fancy, willingly regard this latter day inquiry as establishing for it a new claim to veneration. And it seems to me that those who implicitly accept as proof the deductions which Dr. Papillault has made concerning the remains which a squadron of United States war ships now brings to these shores, and to which we are paying honor greater than has been accorded many of the founders of this Republic, will now find little trouble in reaching not merely the conclusion but the conviction that the world still holds the shroud wherefrom the Body rose to resurrection.

IV.

The reader may answer for himself the following questions:

1. If you were a juror in a case of wilful murder would you bring in a verdict of guilty solely on the proof of the *corpus delicti* here advanced and thereby send the prisoner to execution?

2. If you learned that a relative long since dead, whom no one living could recognize, was interred in a European cemetery, would you solely on the proof of identity here advanced accept an otherwise unknown body, go to the expense of transporting it to this country and bury it in your family plot?

NEW YORK CITY.

In an Italian Garden

BY GERTRUDE HUNTINGTON McGIFFERT

A SHINING hour, a shining sea,
White villas glistening daintily
Hung high 'mid silver olive trees;
The foolish fauns on the gay parterre,
The conscious palms, and here and there
Rose woven crumbling balconies.

The shabby fountains, the vista'd ways,
The sunken dial of vanished days
And the phantom pomp of chivalry;
A scented hour, a scented breeze,
The sunset mantle on the seas
And everywhere—a thought of Thee.
NICE, FRANCE.

The Truth About Hungary

BY COUNT ALBERT APPONYI

[Count Apponyi is a member of the Hague Court, was President of the Hungarian delegation to the Interparliamentary Union at St. Louis, this delegation being the largest one at that memorable conference. He has represented the same constituency in the Hungarian House for a quarter of a century and has been Speaker of the House. But most of his parliamentary life has been spent in opposition, advocating stricter construction and observance of the laws which guarantee Hungarian national independence and democratic reforms in all branches of the law. He has devoted years to the analysis of the laws which define the rights of Hungary, and there is no man in the world better qualified to speak on this subject. Count Apponyi and Francis Kossuth are the leaders of what promises to be a problem for the kings of Hungary.—EDITOR.]

MY visit to the United States to attend the twelfth session of the Interparliamentary Union is among the brightest memories of my life. I found myself in profound sympathy with the people and the nation, and no other three weeks of my life have been so full of useful and lasting impressions.

It was a joy to me to assist at the Conference which resulted in the United States taking its proper place at the head of the movement for the application to international affairs of those political principles on which the United States is founded and of which the United States is the great representative.

It was a joy to take part in this movement, as a man, for it promotes the welfare of all men, and as a member of the Hungarian Parliament, because for centuries Hungary has been an island of political and civil liberty in a sea of oppression and deserves to take part in the establishment of civil and political liberty among nations.

I rejoiced also at the opportunity afforded me to do something while in America toward removing certain false impressions which have gotten abroad about Hungary by speaking to the Congress of Arts and Sciences on the Relation of Austria and Hungary, and I gladly avail myself of the opportunity to put before the readers of *THE INDEPENDENT* the essence of this, my address.

The prevalent misconception in regard to Hungary is to consider her as a member of the Austrian Empire. The truth is that there is no Austrian Empire of which Hungary is a part. There is an Austrian Empire of which Hungary is no part and then there is Hungary, a country larger in area than the Austrian Em-

pire. Hungary is not a part of the Austrian Empire any more than Canada or Mexico are parts of the United States. The Empire of Austria contains seventeen States, as you would call them, each having a Legislature of its own and Representatives in the Imperial Parliament, which sits at Vienna; Hungary is not one of these States. Hungary has its own Parliament at Budapest, in which citizens of Austria have no voice, and Hungary has no Representatives in the Austrian Parliament at Vienna. I am a citizen of Hungary and a member of the Hungarian Parliament, but I am not a citizen of the Austrian Empire. The area of Austria is 115,905 square miles, nearly the same as that of Arizona. The area of Hungary is 125,039 square miles, nearly the same as that of New Mexico. The population of Austria is 26,150,597; that of Hungary is 19,207,103 (census of 1900); so that Austria is larger in population and Hungary in territory. These two great countries have grown up side by side with a very varying history. In a short magazine article I can touch only on the most vital points in Hungarian history.

Hungary has had a representative Parliament since the thirteenth century. The right to vote for members of this Parliament was vested in a class called "Nobiles," which is better translated as "freemen" or "franchisemen" than as "noblemen." The suffrage was more general than in France under Louis Philippe or probably even in England prior to the Reform bill of 1830. At the time of the French Revolution there were 26,000,000 people in France, but only 28,000 families were in possession of the franchise. At that time there

were 6,000,000 people in Hungary and 75,000 families (equivalent to 325,000 individuals) were "Nobles or Franchisemen." Access to this class was easy. In many instances the peasantry of whole counties were admitted to it by a single act of legislation.

The executive power of Hungary is vested in a King. Prior to 1686 the crown was not hereditary. And always the power of the King has been recognized as derived by grant from the people and as limited by the law and constitution of Hungary. On the other hand the privileges of the people of Austria are derived by grant from the crown.

Furthermore, the people of Hungary have safeguarded their rights in many political crises by the declaration of these rights against attempted violation, just as has been done by the people of other nations where civil and political liberty have been preserved. The *great* Hungarian charter, the "Golden Bull," was almost simultaneous with the English Magna Charta, the latter being in 1215 and the former in 1222. They were both spontaneous outcomes of local conditions. Both were a definition and a declaration of resolution to maintain *pre-existing* rights, not the *assertion* of new rights.

Having grown up side by side, in perfect legal independence, tho ruled in fact by the same person since 1526, Austria and Hungary joined each other for certain purposes and within clearly defined limits.

It was decided in 1723 by the Hungarian Parliament that the *descendants* of Leopold I, Joseph I and Charles III, Emperors, should thereafter be Kings of Hungary, according to the rule of succession already established in the Austrian domain.

After this act the rulers of Austria, without losing any of the powers to be exercised by them in Austria and toward the Austrian people, became entitled to exercise in Hungary and toward the Hungarian people those powers which the Parliament and people of Hungary had conferred upon their King. These powers are not only to be exercised in a different territory and toward a different people, but the powers themselves are

different, tho exercised by the same person.

Franz Joseph acts, therefore, in two capacities, as Emperor of Austria according to the laws of Austria, and as King of Hungary according to the laws of Hungary. If you imagine that Mexico should pass a law making the present President of the United States and his successors President of Mexico, and fixing his powers, as President of Mexico, you can understand the relation between Austria and Hungary and how your President would act as President of the United States according to the Constitution and laws of the United States and as President of Mexico according to the Constitution and laws of Mexico.

The instrument which in 1723 provided for the same person to be King of Hungary who is ruler (since 1804 Emperor) of Austria is known as the "Pragmatic Sanction." It contained several other provisions; for instance (1) that the independence of the Hungarian Crown and the liberties of Hungary should remain unimpaired; (2) that when the lineage becomes extinct (direct descendants of the persons named) Hungary will use again her ancient right of free election to the throne; (3) as long as the lineage lasts Hungary and Austria are bound to assist each other against foreign aggression.

The forms of this their first joint action against foreign aggression were settled by the celebrated compromise of 1807, which closed an era of newly arisen difficulties. In the terms of that compromise foreign and war affairs are made common to a certain extent between the two countries; there is a common Ministry of War and a common Ministry of Foreign Affairs. In passing war appropriations and appropriations for common affairs both nations must concur. To facilitate this the bills for these appropriations are at first laid before conference committees of both Parliaments, consisting of sixty members each, sitting one year at Vienna and the next at Budapest. These committees are called "delegations," because they have no power of their own but only powers delegated to them by the respective Parliaments. The Austrian and the Hun-

garian delegation sit separately; they settle disagreements by correspondence and only if this prove absolutely impossible do they meet in order to vote together; but no discussion can take place in joint session. When the delegation agrees on an appropriation it cannot become law in Hungary unless ratified by the Hungarian Parliament.

Legislation concerning foreign and military affairs belongs to the sphere of independent action in both Parliaments. But even in the executive domain foreign affairs are common between the two nations only as far as they affect the interests of mutual defense against foreign aggression; in these both nations act jointly, but they can exercise separately the rights of sovereignty in all other international matters; for instance, treaties of extradition, copyright, railways, etc., with other nations. Each nation can erect a tariff wall on its own frontier even against the other. At present a customs union exists by special treaty between Hungary and Austria, but it is probable that a commercial battle will soon rise between them.

The machinery of common affairs of which I have given here a brief sketch, is entirely dependent on the sovereign free will of Hungary, who may abolish it any moment by a single act of her legislative power. There is no public power superior to her own public powers, entitled or able to control her to any extent. Nothing has been done by Hungary since the original arrangement was made which in any way impairs her freedom to act as an independent nation, or which removes her from her place among independent nations which was reserved and guaranteed by the pragmatic sanction.

The rights of Hungary for which her sons have made sacrifices in the past must be respected. These rights and the ways they are menaced and many other things of grave concern to our people it would delight me to unfold more fully to the American people, for I have an intense desire that they know the truth about Hungary and have spent many years of my life in preparing myself truthfully to relate these things. I must content myself, however, with reiterating

the essential truth and in destroying the prevalent error. There is no Austrian Empire which includes Hungary. There is no Emperor of any Empire which includes Hungary. Such an Emperor and such an Empire exist only in false supposition and to an extent in oppressive practice contrary to law. The truth is there is an Austrian Empire which does not include Hungary and an Austrian Emperor who has no power as such in Hungary. There is a Kingdom of Hungary as separate from the Empire of Austria as Mexico is from the United States, except in so far as Hungary has united with Austria, as above explained.

There is a territory of Hungary, there is a territory of Austria; there is no territory of an Austro-Hungarian Empire, there is no such Empire, there is no law for such an Empire, there are no instruments for the execution of such a law. And yet my nation is suffering from the fact that this false notion is in the minds of people of other lands, and is acted upon to some extent by persons whose duties require them to act otherwise.

My country's strong insistence on her national independence does not imply a wish to break away from Austria. We mean to keep faith with the reigning dynasty; we will loyally fulfill our compact of mutual defense with Austria. But equal faith must be kept with us; those enactments of the Pragmatic Sanction which make Hungary secure of her independence as a sovereign nation must be fulfilled with equal loyalty by the other party to that compact.

To complete national existence we have as good a right as any nation. We have creditably fulfilled our mission as a bulwark of civilization and liberty. This mission is not ended. It cannot be fulfilled if the organic force of our peculiar national mentality and constitution be missing—if that force which stands unshaken after trials before which stronger empires have fallen into dust should give way to artificial combinations and contrivances.

Faithful to the supreme law of our destinies, we uphold the banner of national independence with unflinching firmness of resolve.

BUDAPEST, HUNGARY.

A Martyred Wife

[The following communication tells what we believe to be the true story of the silent martyrdom of a preacher's wife. We have asked another preacher's wife to tell our readers where lies the mistake and how such unhappiness might have been escaped. As to henpecked husbands, we have something to say about them in our editorial columns.—EDITOR.]

Rev. A. B. C. is a preacher of the gospel of Jesus Christ (I will not tell to what denomination he belongs). His family consists of a wife (who is my sister), three beautiful children and a widowed mother. I have been in their home a great deal and thought they were the happiest family imaginable. My sister always spoke of her husband's mother in highest terms of praise, and I never saw a cross look exchanged between my sister and her husband, but on the evening after his departure for a trip to Europe and the Holy Land, and knowing his mother was away, I went over to chat a few minutes before retiring.

Fearing to disturb the children, I did not ring the bell but opened the door and went in. There was no light and my first thought was that she had gone to bed, as it was about nine o'clock. The hall door was open, and after tiptoeing into it I heard voices in the study, and wondering if she might have callers I paused at the door. It was slightly ajar and through the opening a view of the room could be plainly seen as the moonlight poured like a flood through the uncurtained windows.

My sister was upon her knees, pouring out her soul to God, as tho for the first time in years, and yet she spoke as tho she knew him well, but had been keeping back her complaints because they were too trivial to bring to him.

She said that ever since they were married it had been one long self denial (planned by her husband and his mother), that he might have typewriters, books and trips. She had worked harder than he, and now he was spending the fruit of her labor, as well as his, with no thought of her.

She longed to have an old school friend spend a week with her, but knowing her mother C.'s ideas in regard to the expense of entertaining she should not enjoy a moment of it should she come.

The children had come so close together that her nervous system was all worn out, and she was expectant again. Here she broke down and, burying her face in the couch pillows, sobbed until she was relieved. She then compared her lot with the wives of the poor laboring men, some of whom had not the comforts of life. Her husband was kind and good and did not intend to be selfish. Her mother C. was a good Christian, she knew, and she prayed for grace to live with her and to be kind to her. She asked for wisdom to guide her darling children aright. She implored pity for her own weakness and shortcomings. Here I came to myself and stole quietly out of the house, ashamed for having heard what was only intended for her heavenly Father, yet glad that I was not a wife of a selfish preacher.

IN the first place, we must clear the skirts of this poor woman whose prayer was heard by the wrong party. There is a highly moral difference between taking one's husband's sins to the Lord in prayer and in cataloguing them in an anonymous article. Besides, if a wife cannot talk about her husband to her "heavenly Father," to whom may she discuss him, especially if he is a preacher? For the wife of a preacher is under peculiar obligations to idealize him to every one else. She cannot afford to look even comprehendingly intelligent when other members of the "Woman's Missionary Sewing Circle" begin a sympathetic exchange of confidences about how irritable or exacting their "Mr. Smiths" and "Mr. Browns" are, altho

she knows that her "Mr. C." is as crabbed when he is interrupted in the preparation of a sermon as the most secular man in town and that he is even more exacting from having been "pampered" by every woman in his congregation. But she must not admit these perversities, lest she should injure "Mr. C.'s influence." The foolish notion that a preacher is in some particular sense "a man of God" leads unavoidably to some acting on his part and very often to much concealment on the part of his long suffering family. As a matter of fact, he has no more legitimate claim to that title than any other respectable sinner. He does not differ very much from the average man except in his dress, his manner, the honorable distinction of his calling

and in the pietistic aspect of his transgressions. For a preacher cannot be honest and aboveboard about his shortcomings as other men are, lest he "lose his influence." He is obliged to justify them according to the Scriptures in some way, and it is astonishing how many of them succeed in doing it. Thus he is not alone in the class of selfish husbands who have typewriters, buy books and "take trips" at the expense of their feeble, overworked wives. Nothing is more common among doctors, lawyers and other professional men. But he is the only one of them who makes a sort of moral excellence of his brutality and lays it as a Christian obligation upon his self-sacrificing wife's tender conscience. The average preacher's wife will cheerfully turn her last year's dress hind part before and wear it after a compulsory fashion of the seams in order that her husband may buy a new commentary on the Epistle to the Hebrews and thus save himself the mental exertion of doing some original Gospel thinking of his own. And in her heart of hearts she knows that something is wrong. But women are curious products morally when they set their heads to be good. They are rarely disposed to give their man-mates the opportunities they are entitled to have for developing reciprocal virtues. Their idea is to give *all* that is needed. This is the basis upon which "Mr. C." gets everything and a trip to the Holy Land, while "Mrs. C." degenerates into a secret martyr burning at the stake before just her "heavenly Father."

Now no woman should become a martyr unless she is incapable of being anything more effective. It is no longer a commendable form of virtue as it was in the Middle Ages. We have passed that stage now. And one intelligent, self-sustaining woman is more than a match for a husband and a mother-in-law. It is not so difficult to teach them that it is more blessed to give than to receive. It is as natural in a man to give as it is to receive, only his giving faculty is dormant and his taking one is active from the hour of his birth. It must therefore be cultivated, like his talent for music or his genius for poetry. In any case, if a woman has her natural share of feminine

shrewdness and humor and coquetry it is as much a sin for her to allow her husband to impose upon her as it is for him to do it. As for the mother-in-law, she is like the husband and the other children in the house; she should be properly managed to get the best results, and neither she nor her son should be taken to heart too seriously during the disciplining process.

Left to their own inclinations men are always going to be more or less brutal in their relations to women, not because they are brutal, but because they do not know any better. They preach better, of course. It is not uncommon for a minister who is nagging in his family about so sacred a business as their family prayers to preach with the tongue of men and angels about domestic virtues. But living and preaching belong to two different realms; one is reality and the other is the mere poetry of reality. And it is not fair to hold the preacher to any higher standard in his domestic relations than we do other men. They are just as purblind, just as dependent upon their wives for proper conditions to grow in husbandly grace as other men. And if they are permitted to cultivate the peculiar forms of pastorate selfishness so common among them there are very few preachers in the rank and file of the ministry who would not take a trip around the world, luxuriate in Holy Land sensations and even take a God-fearing peep at Monte Carlo while their foolish wives stayed at home and economized.

All of which means that there is a great need of reform among preachers' wives. We know how matters stand at present. Their husbands are the best dressed men in the country according to their income, and they are often the most dingily gowned women. Any observing person can "pick out" the pastor's wife in almost any congregation by the age, the unfashionableness and the ludicrous sobriety of her clothes. And her appearance is more creditable to her good intentions than it is to her good sense. She is a perpetual appeal to the charity of her husband's congregation, while he in his handsome broadcloth and white vests is the ideal of their hearts. He is better liked because of his assured manners

and hearty good fellowship. They mistake the well clothed, well loved expression of mortal satisfaction in his face for heavenly mindedness. Meanwhile poor "Mrs. C." is—a "little difficult, so hard to break through her reserve!" If they only knew it, "Mrs. C.'s" timidity is founded upon her consciousness of looking "tacky." If some heathen god-mother of common sense would clothe her in a summer silk with a plenty of lace and ribbon on it "Mr. C.'s" people would be surprised at the sparkling change in her personality. And it is just as foolish to wonder why pretty clothes emancipate the souls of women as it is to wonder why birds have wings. But the fact is incontestable.

Not long ago the pastor of a certain church traveled three thousand miles to attend a missionary convention.

"My wife and I have been saving up for this trip two years," he said; but she did not come with him. "Oh, she's all enthusiasm for the Church," he continued; "wanted me to get out of my ruts, come over here and get some new ideas." Then he showed her picture, a wan-faced little creature, with her thin hair slicked back, buttoned up in a sagging old dress.

"Oh, she's a hustler!" he giggled, as he passed the cheap card around; "does all her own work and keeps the five children in school."

"That's the kind of wife a preacher needs!" commented a fat old deacon. As a matter of fact, she is the kind of wife no man ought to have unless he wishes to be developed into a pig.

When a preacher on a small salary feels that he can afford a typewriter his wife should encourage him to buy it, and she should look amazed rather than aggrieved when he objects to her spending a like sum upon what she needs for herself. It will not require long for him to learn how to put that kind of two and two together, nor to cower beneath the illustrating shrewdness of her logic. It does not matter whether she thinks he can afford it or not, if she wishes to continue to love and honor him she should not fail to cost him the sum of his typewriter at this juncture. It is better to be in debt for a time than to lay the foundation for contempt toward one's own hus-

band. Besides, he will become more definite, more personal, in his plans for economy. And he will grow in grace, which is harder for a preacher to do in some ways than it is for most men. His path is beset by a very piety of temptations to self-indulgence that would often deceive a guardian angel. On this account his wife is under the more urgent obligation to make it impossible for him to yield to them.

Nor is this a matter for prayer so much as it is one for the intelligent exercise of those faculties with which Providence has already endowed "Mrs. C." She may pour out her soul to her "heavenly Father" about the way "Mr. C." and his mother carry on until she cannot lift one foot before the other in her daily tasks, and her mother-in-law will remain exacting and "Mr. C." will go on taking European tours every time she helps him save enough money to pay expenses. And he will take them conscientiously, too, because she has aided and abetted him in becoming a selfish, pious egotist who can see nothing but his "duty to the Church" and the necessity of harvesting "fresh material" for his sermons in the most agreeable way possible. What she should have done when she packed him off to Europe was not to retire to her closet in a martyrdom of prayer. She should have kissed him a tender farewell with some such announcement as this: "Have a good time! and while you are gone I shall leave the children with your mother and pay some visits to my old schoolmates. It will do me good, and your mother will need something to occupy her mind and time while you are away!"

It will be all the better if "Mr. C." flies into a righteous tantrum and refuses to go to Europe. Then she can leave both of them with the children. The point is to decide and achieve it all gracefully, cheerfully, nervily. There is nothing that takes the fury out of such a man so quickly as to find a straight stretch of steel nerves in his gentle, long suffering wife. In many instances it brings him to his senses for good and always.

The trouble is that such a wife as "Mrs. C." usually lacks the will power. She has given up so often and so much that she has no longer the strength to

withhold what she ought not to concede. Also, she is afraid of "talk." It would be so injurious to "Mr. C.'s" work if his wife were criticised. And of course the mother-in-law would talk. But preachers' congregations are not nearly so simple as some preachers think they are. And while few of them have thought very definitely on the subject of vacations for preachers' wives, since such a thing is so nearly unprecedented, they would rally with a tickling enthusiasm to the adventure that would disconcert any ministerial mothers-in-law.

The one thing absolutely necessary to emancipation of such a woman is a good temper and an active sense of humor. She should never argue, she should cheerfully turn the other cheek to her mother-in-law; she should learn the art of being prettily complimentary to her husband and of attributing to him openly, naïvely, all the virtues she wants him to have. And if he protests grumpily she should be all the more ardent in her

defense of him to himself. If he recalls incidents to prove the contrary, she should put her hand prettily over his mouth and say that she will have no one abuse her hero. And she should be morbidly sensitive with her mother-in-law on this point, passing over no speech that could be construed as reflecting upon "Mr. C.," and thus assuming a nearness and a dearness to him which his own mother cannot accomplish. Meanwhile she must pursue the even tenor of her own way with a childlike simplicity which refuses to be enlightened. It is because wives make unwarranted sacrifices for their husbands so graciously in the open and cry over having to do it only in secret to their "heavenly Father" that they get left at home so often when their husbands go abroad. In short, the whole trouble is the wife's fault and the husband's rudeness. And the fault and the rudeness arise from the fact that neither uses his wit in dealing with one another.

The Canada Underground Railway

BY WILLIAM E. S. FALES

[Dr. Fales entered the consular service of the United States in 1890 as vice-consul at Amoy, China. In his recent volume, entitled "Bits of Broken China," he has demonstrated that he has an intimate knowledge of Chinese life in this country. In view of the present boycott of American imports to China because of our disgraceful treatment of the Chinese entering this country, the following article is particularly timely.

—EDITOR.]

WHEN Congress passed the Chinese Exclusion act it unconsciously created two new industries. One was the Canada Underground Railway, which transports excluded aliens from Southern China to any place in the United States at about three times the rates paid by ordinary travelers. The other was the San Francisco Ring, which levies tribute on smugglers and smuggled, conducts a moderate traffic in contraband opium, and, most profitable of all, imports aliens at five or ten times market rates. Incidentally, it arrests and deports unlucky men who have entered America by the Underground, and thus obtains an enviable

reputation for patriotism and good citizenship. Its watchword is, "Down with the Yellow Peril!"

When Wong Lee, a merchant in New York, decided to have his betrothed come to him from her home near Canton he realized the difficulty and expense of the undertaking. With the wisdom born of experience, he consulted a prominent lawyer, who, after explaining that a Chinaman is not legally a human being, that the law presumed him to be a pauper or criminal until the opposite was conclusively shown, and that the spirit of the law was to shut out all persons with yellow skins, irrespective of character or worth, advised his client to go to Canton,

marry there in European as well as native fashion, and return with his bride. By doing this the happy couple would have no trouble except at San Francisco, where they would probably be arrested and thrown into jail for a few days.

Wong Lee paid the lawyer's fee and thought involuntarily of his native land, where all men are treated alike and lawyers and lawyers' bills are unknown. The advice did not simplify matters. Being a pagan, he did not relish the idea of marrying in European style, much less of having his young wife arrested and incarcerated. Neither did he like the prospect of going to China and back. He had spent six years in building up a remunerative commission business, and his absence would undo much of what he had accomplished.

Through a correspondent in the California metropolis he next applied to the San Francisco Ring, asking what they would charge to bring his fiancée and her brother from Canton to New York.

The application was considered by the Ring in the office of their lawyer.

"This," said the manager, "is what I call gilt-edged business. The applicant is a merchant, rated at \$40,000 by the Sam Tong. It will cost us \$600 to send the girl and her brother to New York, provided there are no obstacles. How about the law, Counselor?"

"Clear as can be," answered the attorney. "They are both entitled to admission under the treaty as well as the Exclusion act."

"I fancied as much," returned the manager. "We will have no trouble at all. Now what shall we charge the fellow for the job?"

"Five thousand would not be too much under the circumstances," suggested the disciple of Blackstone.

"Five thousand!" sneered the manager. "We are in this business for cash and we'll make it *ten* thousand or nothing."

"Supposing he won't pay it?"

"Suppose nothing! You don't know a Chinaman. No matter how clever he is in business, in love affairs he is an absolute ass."

The other members agreed, and Wong Lee was duly notified of their decision. He knew the greed of the Ring, but this

demand staggered him. He declined the offer and broke off all negotiations. Within a month he received a letter from San Francisco, which ran as follows:

"Wong Lee,

"Sir: Our society has learned with deep sorrow that you are arranging to smuggle a young girl into this country from Canton. The contemplated action wounds every Christian heart. We are determined to fight such traffic to the bitter end. If, disregarding this notice, you bring the girl over, we will have her arrested and sent back, and will institute criminal proceedings against yourself and any agent or accomplice you may employ.

"Your obedient servant,

"JABEZ MORTON,

"Secretary Law and Order League."

Wong recognized the menace and put the letter carefully away. Had the Ring understood the man it would not have made this transparent move. It aroused all the combative elements of his nature and he determined to fight fire with fire. Accordingly he visited the New York manager of the Canada Underground Railway and had a brief but satisfactory call.

The official was Charles A. Wing, better known as Charley Wing. He was a half-breed, born in Oakland of a Chinese father and an Irish mother. Mentally, he was a mixture of both parents; physically, he took after his mother. Speaking English and Cantonese perfectly, he had worked his way up in the Canada Underground until he was the second in command. Like a true son of Erin, he was "agin the Government"; yet the joy he felt in breaking the law was small compared with that experienced in fighting the San Francisco Ring.

The Underground began its work the same day. A cipher message from New York started the Canton correspondent in action and astonished the bride-to-be and her family. Preparations were made and by the time the great mails had brought full advices the girl was ready to depart.

The party took the river boat at Canton and sailed down the Pearl River to Hong Kong, where they were transferred to the Canadian mail steamer, which left on the following day. The Pacific Ocean greyhound had scarcely cleared the harbor when a half-breed filed, in the Eastern Extension Cable office, a mes-

sage to the Ring's lawyer in San Francisco, which read:

"Sailed 'Empress India.'"

A similar message went out at the same time addressed to "Charles A. Wing, New York."

In due season the travelers reached Vancouver, where they were met, before they went ashore, by a cousin of the bride and also by an agent of Charley Wing. After their luggage was cleared by the customs they drove to the cousin's house, where dinner was served. The meal was just concluded when a police officer and an interpreter entered the house and arrested bride, brother and cousin. The warrant had been issued on an affidavit which charged that the woman had been abducted and that the brother and cousin were the tools of one John Doe. The accused were too frightened to do more than expostulate, but the agent of Charley Wing took it so coolly that it was evident he had expected some such occurrence. With a few words he reassured them, and escorted them and the police to his carriage, which conveyed them to court. On entering the judge's presence they were gratified to find that the agent had arrived before them, bringing with him a wealthy Chinaman, who was ready to go bail in any amount.

The proceedings were very brief. The complainant's counsel stated that he had just been retained in the case and that he would ask for a week's adjournment, the accused to remain in jail *ad interim*. The defendants' lawyer protested vigorously and the judge ordered the case to proceed.

The complainant took the stand. He was a shabby, red-faced individual, on whom liquor and vice had left indelible marks. He knew nothing about the matter of his own knowledge. His information had come from a friend. The friend lived in San Francisco. He preferred not to give the friend's name. If the court ordered him to he would disclose it. He finally stated that the friend's name was Thomas Doolittle, which was that of the manager of the Ring.

On cross-examination he admitted that he had no regular employment and that he had several times been arrested for

intoxication, fighting and petty larceny; that he had been paid for his trouble in coming into court, and that he had no means to prove his charge against the prisoners.

This was the evidence for the prosecution. The defendants' counsel submitted to the judge duly authenticated certificates from the Chinese authorities and the British Consul at Canton, verified statements from the captain and Hong Kong agent of the "Empress of India," and affidavits from Wong Lee and the manager of the Hong Kong and Shanghai Bank in New York. There was still other evidence, but the judge interrupted the proceedings:

"You need go no further, Counsel. I am convinced that this prosecution is an attempt at blackmail or something worse. The complainant is utterly irresponsible, and the defendants are of excellent standing. The complaint is dismissed and the defendants honorably discharged."

This defeat did not discourage the San Francisco Ring. That night the wires of the Associated Press carried the following news item, which appeared in a thousand newspapers during the next forty-eight hours:

SACRIFICES TO MOLOCH.

"Vancouver, May 2d.—A beautiful Chinese girl named Ah Ho, and a low-browed Chinaman, claiming to be her brother, were arrested to-day on leaving the steamship 'Empress of India,' and arraigned before Justice Hawken on the complaint of John Alexis Smith, a prominent citizen, that the woman had been abducted in China and brought here a slave. The prisoners interposed the usual defense, that the girl was going to New York to marry an alleged Wong Lee. The magistrate declared that this infamous traffic must be suppressed, but as the complainant was unable to adduce sufficient evidence, he felt compelled to release the prisoners."

The Associated Press did *not* transmit an item which appeared in a Vancouver paper two days later:

"John A. Smith, a barroom loafer who has repeatedly been an inmate of the jail, had a windfall day before yesterday and celebrated his good fortune by getting fighting drunk. It took three policemen to arrest him and two to bring him into court this morning. Justice Jackson sentenced him to ninety days with hard labor."

The unsuccessful movement of the Ring produced results in several directions.

Wong Lee, furious at the outrage, called on Charley Wing and had a long consultation. That night Wing and a slender young Chinaman left for Montreal.

The Treasury Department at Washington sent out a circular notice to the Immigration Inspectors on the Northern border, in which special attention was called to Ah Ho and Tai Sing, her brother.

Thomas Doolittle, the San Francisco man who had instigated the arrest, was attacked one night when entering his home and beaten nearly to death.

Ah Ho and her brother remained in Vancouver nearly a week and then, accompanied by an interpreter, came East on the Canadian Pacific Railway. Among the passengers in their car were two men, who watched them closely. One of these was a Secret Service man and the other was an agent of the Ring. Nothing occurred until Winnipeg was reached, where the train stops half an hour. Here the interpreter went out, followed by the Ring's agent, and returned promptly with a pot of tea. Again he went out, carrying the emptied pot, but this time he did not return. As the train started a young Chinaman entered the car, sat down beside Ah Ho and started a conversation. A second later the agent of the Ring was seen on the platform, running for the moving train. Fortune favored him. He caught the last car, but lost his hat and badly bruised his ankle. At Montreal, where there is another half-hour wait, the party sat quiet for some minutes, Ah Ho appearing to expect some one. Then they rose, walked quickly through car and station, and, entering a closed carriage, were immediately driven off. The agent of the Ring ran hurriedly about, engaged a second coach and tried to follow them, but without success.

The Secret Service man was joined on the platform by three associates. They chatted a few minutes and then separated, he repairing to the Queen's Hotel, his headquarters when in Montreal. In passing the parlor he caught a glimpse of a handsome middle-aged

woman playing the piano. That evening he saw her in the dining room, where she made so attractive a picture that when the meal was over he asked the hotel clerk who she was.

"A wealthy widow, Mrs. Van Duyne, who is stopping here while her daughter is being treated by our best oculist."

Alston obtained an introduction and found his new acquaintance as charming mentally as she was physically. The attraction proved reciprocal, as the Secret Service man was bright, witty and good-looking. She told him how her daughter's eye had been injured in a game of tennis, three weeks before, so that the sight had been despaired of at one time. The skill of the oculist had saved the girl's vision, but it would be several months before she could remove the bandages. Alston sympathized, and, in turn, told her about Ah Ho. The widow was deeply interested and made a number of ingenious suggestions. He laughed and complimenting her on her detective ability, said he had already done nearly everything she had proposed. There was little indeed that he had not provided for. He had run Ah Ho down so closely that he knew she was in one of two houses, both of which were under surveillance night and day. When the widow heard this, she laughed and exclaimed:

"Look out, Mr. Alston. If she's a true woman, she'll get away despite all your precautions!"

In the meantime the agent of the Ring had been in a condition of mingled fury and despair. Dispatches from San Francisco had hinted at indolence and carelessness on his part. In desperation he called upon the police, from whom he obtained Alston's name and address.

That evening he visited the Queen's Hotel, passing, as he walked down the entrance hall, Alston and Mrs. Van Duyne, who were sitting in the parlor. They happened to look up as he went by.

"What a cruel face that man has!" exclaimed the widow. "I'm positive he's a card sharper or a runaway cashier from New York."

"Hardly," laughed Alston. "He looks more like a crushed tragedian. I've seen him before somewhere. Oh, yes! I remember him now. He crossed the

continent with me, but never spoke to anybody on the train. By jove, perhaps he is helping Ah Ho!"

Alston paused as a waiter came forward and handed him a visiting card. He glanced at it, then rose and bowed to the widow.

"Please excuse me for a few minutes. Here's a card from a man who wishes to see me on business. I suspect it's the fellow who just passed us, and that it concerns Ah Ho. I'll return as quickly as possible."

He handed her the card and left the room. Upon it she saw in plain type:

WILLIAM WILLIAMS,

2995 Market Street,

Private Detective. San Francisco.

Mrs. Van Duyne smiled and remarked to herself, "This is what Charley expected. Williams has lost the trail and now as a forlorn hope appeals to Alston."

The Secret Service man went to the clerk's desk and there met Williams.

"Can I see you a moment in private, Mr. Alston?"

"Certainly. There's a smoking room down the hall which is usually empty at this hour. We'll go there."

They entered the room, which was deserted.

"I came to see you in regard to a Chinese case, one Ah Ho, who came from Vancouver and is hiding here before going to New York. I suppose you are out for money, like all of us?" Williams began, insinuatingly. The Secret Service man bowed as if in assent.

"It's worth nothing to arrest that woman and send her back to China. It's worth three thousand dollars to arrest her and then let her off to go through to New York."

"How's that?" queried Alston. "Isn't she a poor slave girl that's going to some den in New York?"

"Not on your life!" sneered Williams. "That's what our society always publishes in the papers. Besides which there *ain't* any dens in New York. The girl's going to marry a rich pigtail, who'll gladly cough up three thou. to secure her release. If you'll arrest her on the border, I'll go on to New York and get the cash. Then we'll divide and let her go."

"There's too much risk for the money."

"I'll make it five thousand, then."

"But who will square me with the Government in case of trouble?"

"Why, our society, of course. We are making a fine thing out of the business and we stand by one another through thick and thin."

Alston rose from his chair. "I've heard enough, Mr. Williams, of you and your 'society.' I shall arrest this Ah Ho, and if I catch you around interfering with justice, I'll shoot you. Good evening."

He rejoined the widow and told her about the interview. She listened attentively and said after a moment's pause:

"You are a better man than I thought. Most people would have taken the bribe he offered."

* * * * *

The next day was very busy. Alston was called to the telephone by one of his men, who reported that a carriage had driven up to the house he was watching and taken away a Chinese man and woman to a house eight streets distant. The message had scarcely been received when the telephone rang again. It was the man watching the second house, who reported a similar occurrence there.

The Secret Service man gave what orders he thought necessary and started toward his room. In the hall he encountered the fair widow.

"I'm so glad to see you, Mr. Alston. I was looking for you to beg a favor. The oculist here has ordered my daughter to go to the Eye and Ear Infirmary at New York, and has had a physician sent up from there to escort us. We wish to take the express which leaves in an hour and a half. I have telephoned for berths and a private compartment on the Pullman, and am now on my way to get my daughter and the physician and drive with them to the train. Will it be too much trouble to go to the station, pay for the tickets with this bill, and explain to the porter and conductor the necessity for quiet? If it will not be imposing *too* heavily upon your good nature, you might also order some flowers to cheer our poor little invalid."

Alston gladly assented and carried out the program as requested. The little

chamber on the car was made fragrant with roses and carnations. The carriage arrived in due course. The young girl, veiled and bandaged, was lifted out by a brawny Canadian and laid in the bed prepared for her. The New York physician won Alston's heart by his courtesy and brilliancy. Thanks to Alston the invalid was not disturbed upon the journey.

Ten days afterward he received a note from the widow, which he never showed. It contained the following lines:

"My 'daughter,' Ah Ho, was formally married to Wong Lee yesterday, so that your conscience may be clear in regard to the aid you unwittingly rendered Charley Wing and myself in evading Uncle Sam's foolish laws. Sorry you did not have a chance to shoot Williams."

NEW YORK CITY.

The Cheerful Life in the South

BY MRS. L. H. HARRIS

THE South has always been missionary ground, not because we are more wicked than other people, but because we are so self-possessed. Some think this assurance is neither moral nor intellectual, and it is not, it is temperamental. We are not open to foreign convictions, because we have an awful personal integrity in such matters. We are determined to remain true to ourselves, whether we ever advance an octave in the scale of things or not. This is not an enlightened virtue, but it is a virtue, and with a better moral ancestry than many more enlightened ones.

We are also charged with a lack of energy and of enterprise. But this is not a fault. It is a philosophy, founded upon climate and a gift we have for irresponsible cheerfulness under the most adverse circumstances. Besides, it makes a difference where one is born. And most of us have been so well born we have not the same self-making impulse which spurs less fortunate people on to deeds of glory. This is why we resent with peculiar indignation the presumption which lies back of so much exhortation to be "up and doing." We have less to do than most people, in the very nature of things, and it is a matter of irritation to us that so few recognize the reason why.

It is worthy of note that there are no

disciples among us of the more recent cults in living. The reason is we have a cult of our own. "The Simple Life," for instance, requires too much discipline, too much self-restraint, and it leads too easily toward certain affectations that we could never tolerate. Disciples of simplicity are apt to be skeptical of their less abstemious neighbors. Thus, no one approves Thoreau in the South, altho so far as the simple life is concerned he had the root of the matter in him. But he became an insufferable cad in his relations to Nature, in his effort to follow out the logic of his position. The spirit which could lead him to sit astride a respectable pumpkin and patronize everything in sight would not be popular here. We do not even buy what Mr. Wagner has to say on this subject, because we are already engaged to live the merely "cheerful life." This is a less expensive adjustment to the general situation. It is not so serious or so self-cultivating as the "simple life," nor so drastic as the "strenuous life." It takes in one's neighbor genially without becoming a missionary or a taskmaster to him. It is a radiance, not an energy, except in its opposition to the "strenuous life." And it is not really immoral to be opposed to such a high working tension. Some must be strenuous, of course, because they are the tool-people

who make and keep the world together. But we of the South resigned from that business forty years ago, and now, barring a few infected souls, we prefer the merely cheerful life which curtails ambitions and does not found self-respect upon the realization of great ambitions. Besides, if we all become strenuous, there will no longer be "room at the top." And what is "the top," anyhow? A very stingily constructed and precarious elevation above the narrow brow of public opinion, from which many disciples of fame and strenuosity topple back into their original dust! It is easier to walk into the grave than to climb into it, and quite as decent a way of being dead. For, once we are buried, no Mark Antony funeral oration or memorial tablet will resurrect us till God calls. Then the cheerful Southerner who lived gayly upon a level with his common kind is as sure to rise as the most strenuous hero that ever lived. Immortality is likely to prove disconcerting to some very able, intelligent, effective people. The peace and harmony of it will not rime with their distractedly energetic spirits. But it will be an experience peculiarly suited to some of us in this region who have had the opportunities of a pleasant lifetime to cultivate the cheerful, indigent, peaceful mind.

When I was a child we went to an "old field" school. On account of a certain cheerful limitation in wit and intellectual energy I was dedicated to the "foot" of the "third reader" class, while Minnie Lee, a very freckled faced, conscientious little girl, who wore absurdly long pantalets, maintained the head of it with commendable effort. We were accustomed to reading Longfellow's poem "Excelsior" in concert. That is, Minnie Lee and the other pupils read it, while I wept for the brave young man who died at the top,

Still grasping in his hand of ice,
That banner with the strange device.

I do not know if it was because I had never moved onward, or upward in any direction, and felt in my too tender imagination the poignant agony of the long climb, or if I was moved by the marching melody of the words; but they appealed to me so strangely that I was

always obliged to retire from the class in tearful enjoyment of my emotions, while Minnie Lee carried the "Excelsior" chorus to a thrilling close in her thin, high voice.

During the twenty years that have elapsed since I have often wondered what could have been her conception of the poet's meaning. She is a good woman to know, but not because she has ever showed the least inclination to emulate the unfortunate youth with the Excelsior motto. She married a poor but cheerful man, is the mother of five children, and lives in sight of the little old school house. She has never tired of the scenery, never showed any aspiring dissatisfaction with her lot in life. She is ample and gracious, like a feather pillow that has been long in the sun. She wears flowered calico gowns which suggest a sort of colossal kinship between her and the roses in her garden. She recalls with charming appreciation every incident of our school days, and she has the biography of all her babies on the tip of her tongue. "Do you remember the blue birds that used to nest in our old gate post?" she asked me the other day, and I recalled a spring time of happy mornings when we tripped through the dewy grass to watch the young fledglings.

"They have had their nest there every year since," she said, and I knew that she still had the same Maytime interest in the pretty sight.

"Do you remember the time Johnny Kicklighter stepped on the honey bee in the spelling class?" she laughed merrily, and there flashed before me in pantomime the victim of that tragedy, a picture lost until then twenty years deep in the past. "He married one of the Bilby girls. You remember her, the little one who used to ink her toes. They have three children. Doesn't it seem strange the way we grow up and get old and can't stop, and have children coming after us who find the same bird nests and get stung the same way by the bees!" And indeed it did seem strange just then. We were so near the sun rim of an eternal childhood, out of which Minnie Lee seemed never to have wandered.

Some will call this a case of arrested development. But to my mind it was arrested nearer the gates of Paradise than

many of us will ever come. She filled the day with her precious annals. I felt that she could fill every one the same way, and that it would be like listening to a long poem with epic stanzas here and there. She knew so much that was good and natural and innocent. She loved so much with peaceful tenderness. She hoped so cheerfully from day to day for the sunshine and the rain, looked forward to her Sabbaths, and believed more in God than any modern interpretation of life or Scriptures would warrant.

The South is full of such women. They are the granddaughters of the old war dames who wore silks and counted their slaves by the hundreds. And if anybody thinks they have come down in the world it is because they do not know where up is. If we ever do see clearly, one of the first things we shall discover is that some of the best people are not where we think they are and that some of the wise ones are not where they ought to be.

NASHVILLE, TENN

Race Prejudice in a Northern Town

BY FRANKLIN U. QUILLIN

[Nothing about this town, we believe, has ever appeared in print, as no one knowing the circumstances has appreciated their uniqueness. The town has produced but one college man besides the author, who as a post-graduate at Harvard received his M. A. degree last month. He is making a special study of the negro question in connection with his course in economics.—EDITOR.]

IN the town of Syracuse, Ohio, on the Ohio River, four miles above Pomeroy, a town of about 2,000 inhabitants, no negro is permitted to live. No negro is permitted to stay in the town over night under any consideration. This is an absolute rule in this year, 1905, and it has existed for several generations. The enforcement of this unwritten law for keeping the negro from staying in the town over a single night is in the hands of the boys from twelve to twenty years of age, while the attempt of a negro to become a resident of the town is resisted by the town *en masse*.

When the colored man is seen in the town during the day he is generally told of these traditions, if he is so ignorant as not to know them already, and is warned to leave before sundown. If he fails to take heed, he is surrounded at about the time that darkness begins, and is addressed by the leaders of the gang in about this language: "No nigger is allowed to stay in this town over night. We don't care what you are here for. Get out of here now, and get out quick." He sees from twenty-five to fifty boys around him talking in subdued voices and waiting to see whether he obeys. If

he hesitates, little stones begin to reach him from unseen quarters, and soon persuade him to begin his hegira. He is not allowed to walk, but is told to "get on his little dog trot." The command is always effective, for it is backed by stones in the ready hands of boys none too friendly. So long as he keeps up a good gait, the crowd, which follows just at his heels, and which keeps growing until it sometimes numbers seventy-five to one hundred boys, is good-natured and contents itself with yelling, laughing and hurling gibes at its victim. But let him stop his "trot" for one moment, from any cause whatever, and the stones immediately take effect as their chief persuader. Thus they follow him to the farthest limits of the town, where they send him on his way rejoicing (?), while they return to the city with triumph and tell their fathers all about the function, how fast the victim ran, how scared he was, how he pleaded and promised that he would go and never return if they would only go back and leave him, how Johnnie Jones hit him with such a big rock that it knocked him down. Then the fathers tell how they used to do the same thing, and thus the heroes of two

wars spend the rest of the evening by the old camp-fire, recounting their several campaigns.

In my youth I participated in several of these chases, and must own that I always enjoyed them, with the exception of one evening, when the poor victim was so fagged out that he could not maintain the "dog trot" on the last few hundred yards of his "dash," but fell off to a walk. The poor fellow pleaded for mercy with all the despair of a doomed soul, until a few of us stepped forward and defended him, notwithstanding the gibes and threats of the worst of the mob, some of whom would not have felt remorse had they taken the life of the poor wretch.

This was an exceptional case; in general the boys know that they can make the "nigger" (I never heard a colored man called anything else in the town) run without injuring him; they liked the fun of the chase and the terror of the victim, incidentally using a few stones to enliven the situation.

The conditions and circumstances in this town of Syracuse are unique in many ways; for all the surrounding towns have a considerable negro population. Just three miles below is the small town of Kerr's Run, which has more black residents than white. Most of them are afraid to go up to Syracuse even during the daytime, for the reputation of that town is known by almost every negro that works upon the Ohio River between Cincinnati and Pittsburg. Syracuse is the eastern terminal of the White Collas Line Steamboat system from Cincinnati. Many of the negro hands on this line are afraid to go up into the town to load salt and to get freight, unless the steamboat officers are with them. When they want anything from the stores they usually try to hire some little boy to be their messenger.

One colored family lives in the country on a small farm, just beyond the town limits. The father, whose name is Rush Johnson, came there during the Civil War, and he tells many stories of how he was brutally stoned and in other ways warned to leave the country. He was a courageous, industrious, and honest negro, and in a few years so won his way that he was permitted to stay without

being molested. However, he and his children have never dared to come into the town after night.

The oldest son of this family, in resentment at an insult one day, struck a white schoolmate. He was pounced upon immediately by a mob of white boys, brutally beaten, and rolled over a steep embankment, sustaining many injuries. He left school, went West, worked his way through college and is now an eloquent minister of the Gospel in an African church in Illinois.

A daughter of this family attended the High School in the class before that of the writer of this article. Living within the limits of the High School Special District she could not be debarred, but was practically sent to "Coventry." None of her schoolmates ever talked with her, and they objected so much to sitting near her that the principal had to arrange a desk for her completely removed from the rest of the school. She was scarcely if ever called on to recite, while all her classmates were reciting continually. For weeks it seemed the poor girl never spoke a word from the time she got on the school grounds until she left. Through all these and many more discouraging circumstances the brave girl struggled on through her four years' course, passed her examinations, and was within two months of graduation when she was attacked by consumption and compelled to give up her school work. Then for the first time the heart of the town was touched by the sufferings of a colored person. All knew her case, had seen her struggle, most had opposed her; but at last sympathy sprang up. The Board of Education suspended their rule requiring the passing of final examinations, voted Miss Margaret Johnson her diploma, complimented her upon her unusual pluck and perseverance, and wished her a return to health.

During these two months of illness before Commencement she was not idle. For four long years she had gone to her school regularly, had studied her lessons, had attended her classes, like the rest of her classmates, and during those years she, too, had thought of the night when she should stand before her friends (her family, of course, for none others of her race dared come into the village)

and should receive the diploma that would crown for her so many hours of weariness and of longing.

So during these days of sickness she produced her essay and prayed that she might be permitted to read it, along with her classmates, for she was always eager to do as they did, altho she knew that she was among them but not of them. Whatever her bitter thoughts, she never expressed them; never once had she complained of her treatment or shown resentment.

On the day when the long looked for Commencement Exercises were to be held in June, 1896, she appeared in a carriage and was assisted to the front seats, where she sat by the side of her father and two brothers, but her mother had recently died of the same disease that had seized upon her. She was too weak and ill to sit upon the platform with her twelve classmates, and so with sad but triumphant eyes, sat facing them. Were they proud of her achievements? Far from it. Several of them until the last minute strenuously objected to graduation with a colored person, as tho it were a disgrace that would be visited upon their children to the third and fourth generation.

Finally the name, Margaret Johnson, was reached upon the program. Tho aware that she would not be required to read her essay, she insisted upon doing her part. Rising from her seat, she took a few steps forward, but was unable to mount the platform; so she turned where she was and in a low voice, scarcely above a whisper, read her essay on the threadbare topic, "Perseverance," but it was a theme that burned with life for her, the first and last of her race to stand before a Syracuse audience.

Thus she triumphed, the diploma was hers, won on just the same grounds as those of her classmates. She had done her part in winning respect for her race, but the sacrifice had to be paid. Two weeks after her triumph her course was run. Consumption, the disease so destructive to her people, claimed one of the fairest "flowers of the race."

While this girl showed to the white people of the town the possibility that the negro might amount to something, that he might possess some qualities that

they admired but did not always show themselves, yet she could not dispossess them of the prejudice that had been nourished by them for so many years. After nine years still no negro lives within this Northern town, no negro works alongside of the white man during the day, and no negro so much as breathes the night air within its gates.

The cause of this extraordinary race prejudice is hard to discern. The majority of the inhabitants are not from the South, but, strange to say, are of New England stock. In the early days of the town many Irish lived there who were so bitterly hostile to the negro that some people attribute the subsequent treatment of the colored man to their influence. The population is mixed, including many Welsh and Germans. Most of the people are day laborers working in the coal mines and in salt manufacture, and perhaps they feel the danger of negro competition. Certainly they would as readily associate with a snake as permit a black man to work by their side. They almost feel that he defiles anything that he touches. To the women he is an object to be dreaded and feared, even in the day time. The little children are taught to fear the "Black Man" with all the horrors associated with that name. The writer has seen many a child frightened almost into hysterics at the mere sight of a colored man, and he was himself imbued with the terror. What has caused this fear? No crime has ever been committed by a negro within the town, altho many have occurred nearby, which perhaps serve to maintain the prejudice in spite of many things that might have worked toward undermining it.

Since the town was founded, about 1815, not a single negro family has lived in it. About the year 1855 two negroes were employed as domestics by a family in the extreme lower end of the town, practically in the country, but they did not stay long. Since the Civil War two attempts have been made by negro families to settle in the town, but both were summarily driven out. The following incident will reveal the mode of dealing with such cases and the temper of the people:

About the year 1886 a colored man said

that he was going to live in Syracuse; he had a right there and he was going to show them that he was just as good as they were. So with his wife he brought his few household goods and put them into a small house which was only four or five doors from the writer's home. In the afternoon he was called upon and told the rule of the town and that he too must leave before night. He replied that he would live there as long as he wished, but he was clearly told what would happen. The town was not incorporated and hence he could obtain no police protection. The word went over the town with wonderful rapidity, and the people immediately prepared to resent this affront to the town's dignity and pride. As soon as darkness had fallen upon the scene an immense crowd

of boys and men assembled before the house. They called for the occupant to come out. Growing impatient the crowd went through the door with a rush. The negro was quickly overpowered, taken from his wife and marched into the street. There he received the direction to march. He marched to the edge of the town, where he was left with the information that he might sleep anywhere that he wished, so long as he was out of the town limits; his wife would be guarded in the house over night, and if he were caught sneaking back before daylight he would be hanged to the nearest tree. The next day he was allowed to return to the house and reload his wife and goods.

So ended the last attempt of a colored man to live in this Northern town.

CAMBRIDGE, MASS.

The Ministry and Social Reform

[The following letters in reply to the two recent articles in *THE INDEPENDENT* which described the motives of one who left Socialism for the Church and another the Church for Socialism have called forth many replies, of which we are sorry that space only permits us to publish the following. Singularly enough, most of the writers confine themselves to the question of the Church versus Socialism, whereas we had hoped that the larger question of whether the Church is now the most efficient organization for the promotion of the brotherhood of man would have been more fully discussed.—EDITOR.]

Why I Stay in the Ministry

In some of the great European cathedrals the traveler is arrested by the startling announcement, "Confessions heard in all languages." It appears that *THE INDEPENDENT* has assumed that rôle for America, and Bachelor Maids and modern Socialists here tell out to all the world the story of their blighted hopes and realized dreams. May I dare to hope that here, too, one who has kept the beaten track may tell the story "Why I Stay in the Ministry?"

One who has tasted of the joys of the Christian ministry will not readily haste to other labor. One morning, before I had my breakfast, a professional man called at my home. His was a short and sad story. He wished his name dropped from the Church roll. He was a hypocrite, he said, and wished to be such no longer. His years had been filled with struggle and failure and discomfiture with the demon drink. He was ready to give up the fight. We talked and prayed together, and he

went forth a new man, stronger to endure and pledged to stand true. *And he stands.* Why should I quit a job that gives me work to do like that?

I sat in a little country hotel out on the Western prairie not long since. A man sat opposite whom I took to be a railroad man. He entered into conversation and, when he learned my business in life, said somewhat cynically, "I'd like to be a preacher and be petted and get twenty dollars an hour and do all my work in one day." He urged his case against the ministry quite bitterly, as it would seem, and a friend of the cloth who was with me left the table in disgust. I felt that the man was speaking not his own thoughts and that his bark was worse than his bite. The conversation drifted to daily toil and then to home and family. He was a widower. His wife had died six months ago and he was alone with four little children. Strong man as he was, as he told the story of the parting the tears came into his eyes and he said: "Brother, I've been fooling you a bit. I am

trying to be a Christian. I run an engine on the Limited across these plains, but when my wife died the first man who stood beside me ready to help was the preacher who was my wife's pastor. I've joined the Church, but I find it hard to live a Christian life on the road. If it were not for the fact that I can get to church occasionally I think I'd have to give it up." I stay in the ministry because I want to be at my post when he and his countless brethren come for help.

(REV.) HUGH T. KERR.

FIRST PRESBYTERIAN CHURCH, HUTCHINSON,
KANSAS.

Why I Left Professional Propagandism

I have not only left the ministry; I have left all professional propagandism. One's soul may be troubled not only with the alternative of the Church or Socialism; it may also be tormented in rebelling against the life of a propagandist, and that is one reason why I left the ministry.

It is quite true that I had come to disbelieve the Christian doctrines. Indeed, I went through three distinct tho somewhat overlapping stages in my intellectual life. I may call them the theological, the ethical and the social, and it will be plain what I mean as I go on.

In the theological period of my thinking I connected all phenomena with a divine being. What does God do with dead heathen? What is his purpose in causing pain to multitudes and in giving a few men great comforts and much power? All duties I looked at as ordained by God. This is right and that wrong because God says so. In a word a person above and outside of myself was the center of all my thinking. My theology was largely teleology and the purpose was a divine purpose. Doing right was pleasing God and doing wrong was displeasing him. In a personal God I lived and moved and had my being. My difficulties in this first stage began to arise when I was in the theological seminary, and when the mission board, to whom I had applied for appointment, tried to insist on my believing certain things about the fate of dead heathen. This made me wonder what became of dead Bostonians, for it was a theological inquisitor in Boston who insisted that different psychological processes took place at the time of death in pagan Hindoos and in Americans. The inquisitor and I were both agreed in not raising the question whether there could be anything that could properly be called life after death had taken place, but we could not agree as to what took place in this unknown sphere of existence. He thought the heathen in Boston as well as in Canton were surely damned, but I was inclined to give them the benefit of the doubt, just as much

as I did the heathen Chinese. And so I was kept on the rack for a year or more, and then there were some good people who thought the principle at stake important enough to raise a sum of money sufficient to support me for a few years in the foreign mission field. The principle at stake was whether or not one might be free to believe that men who were out of hearing of church bells were to have a fair probation before the judgment day. As soon as I was out of hearing of church bells myself I laid this question of future probation on the shelf and thought no more of it. But having begun to entertain doubts, I could not stop, and for six or eight years I wrestled with the question of miracles and the supernatural. What really happened, I asked, when there was an alleged miracle? Of course, like all good Christians, I did not believe in Buddhistic miracles, but soon I also disbelieved in the Old Testament miracles and later in apostolic miracles, and later yet in Jesus' virgin birth, and still later in his reported wonders; but I did cling to his resurrection for a long time and took the general position that we do not believe in Jesus because of the miracles, but we believe in the miracles because of Jesus, who was the culmination of a special revelation and the example and proof of a special providence. But before long I saw the absurdity of believing in one miracle and no more. Because Jesus' body was raised from the dead it did not follow that my soul would be. His so-called resurrection did not prove immortality; and just as true the other way around, my immortality did not prove his resurrection.

The last hope to which I clung was the belief in Jesus as the ideal man. I let everything else go that involved the supernatural in his life. The healthiness of a skeptical frame of mind appealed to me, and I accepted without flinching Paul's alternative: "If Christ hath not been raised, then is our preaching vain; your faith is also vain." My faith had become vain. But still for a long time I refused to doubt that God is good. I remember as clearly as if it were yesterday going home one evening from a native prayer meeting, my very attendance at which had begun to seem to me an untruth, that as I passed through the darkness of a bamboo grove I said to myself: "Well, whatever else is true, I believe that God is good." But before long my fine new weapon of doubt had to be turned against this belief too.

More and more there arose to my mind insuperable difficulties in adjusting the Christian theology to any rational view of evolution. So with the evolutionary philosophy as a clue, I started on an entirely new path. I abandoned the attempt to account for events by referring them to a plan, divine if you please, according

to which they took place. Instead of trying to find out causes by searching for ideas in themselves I tried to find out the processes by which things have come to be. Instead of asking why God did thus and so, I began to ask how it came about that this or that is so. Instead of querying, "Why must I suffer?" I began to ask for the steps of evolution that made me a sensitive being. Under this method I soon abandoned the idea that I and other Christians were favorites of heaven, and equally that any one was in special danger of calling down divine wrath on his head for irreverent inquisitiveness. In the upheaval that followed I was driven to cast about for a new ethical standpoint. If I could no longer explain the world by referring everything to God's inscrutable goodness, then I must have a new standard by which to measure moral values. Duty seemed to be the one thing sure. If I could no longer sing "And Right Is Right Since God Is God," I began to preach that it is right to do right because it is right. Not reward now or hereafter, not the pleasure of God, but simple duty must be one's guide and inspiration. Such mottoes as "Not religion as a duty, but duty as a religion," found in me a responsive chord. The absolute theory of morals, with its dictum of "natural rights" and "eternal principles of morality," possessed me strongly enough to carry me through what seemed a very important crisis in my life. I had come out of what I have called my theological frame of mind and I found myself in a new atmosphere. I had gone through a revolution in my thinking in dethroning dogmatism and enthroning doubt, but I was still in the process of adjustment in working over my metaphysics to fit the facts of evolutionary science. At the same time I was confronted with the very practical problem of how to fit my everyday practices to my new ideas. I worried more over the question how to be a consistent agnostic in the Christian environment in which I had grown up than I did over the whole intellectual adjustment. It took some courage to think away from the old mental moorings, but in anxious anguish that was nothing compared to deciding what to do about it. I was too cautious to make a leap in the dark. I had come to my conclusions all by myself and knew no one who could sympathize with me. So I consumed much time trying to think through the problem how to be both true and honest. In the process I did some timid, not to say cowardly, things. I went to church like a true "pillar of society" setting a good example. I actually baptized some people after I had repudiated a belief in the Trinity. I conducted a communion service when I thought it was the relic of a superstition. I "gave thanks" at table even after it seemed only my good luck that I, instead of the beggar

on the street, had something to eat. Such are the constraints of custom and habit.

Nor was I idle. I carried on my school work, and since preaching had come to mean a means of converting people to an accepted philosophy of life rather than an opportunity for shedding light on facts scientific and social, I lectured rather than preached. But of course I could not long remain a missionary of orthodox churches while harboring disbelief in their professed creed; common honesty forbade. So I found myself face to face with the problem of conformity. It was not enough that I privately rejected the old creed and the theological philosophy; my very profession belied this. Actions speak louder than words, and hence my active identification with a certain group of thinkers must be interpreted, I said, as an expression of my own views. In a word, "Shall I," I asked myself, "pretend to subscribe to a creed in which I do not believe? Shall I work in a church which believes in its own ultimate supremacy when I do not believe in it? Shall I accept the name Christian when Jesus is not my only or chief ideal?" Just at that time the editor of the *Outlook* wrote that if Jesus were here to-day "He would remain a member of whatever church He happened to be born in." I did not agree with the editor, but in any case such a course meant to me to be intellectually conscienceless. To be an ordained minister of an orthodox mission board meant, if it meant anything at all, an implied, if not an avowed, assent to the beliefs held in common by its churches. Those were not my beliefs and the sooner I left my position the better. "Duty" was my watchword and my comfort during this trying time, yet in the name of duty I had done some questionable acts.

On my return to America I looked with longing eyes to liberal bodies, some of which called themselves churches and some not, in my hope of finding an audience for my "message" and a field for my activity. The cordiality of my reception convinced me for a while that my aversion to professional propagandism was mistaken. I went to work in a charity organization and in a social settlement in a Western city with the avowed purpose of training myself for ethical leadership. It was not long, however, before I realized that to work in harmony with the organization meant the commitment of myself to a particular set of views which, tho "liberal," were not one whit less dogmatic than the Christian philosophy from which, with great pain to myself and friends, I had parted. Clearer and clearer to me it became that to make one's living by preaching meant the stultification of the preacher. It was absolutely necessary to preach about such things and to reach such conclusions as the organization wanted to

hear, be it "church" or "society," or whatever.

But now new difficulties began to arise. I began to ask, "What is duty, after all? What are the bounds of morality and what are its sanctions? Is there such a thing as an absolute standard of morals? What is the origin and the nature of the sense of right and wrong, of conscience and remorse?" I began to strain out the moral quality of things, to surmise that morality and immorality were largely relative terms and that the universe was mostly unmoral. Virtue, I conceived, was an attainment, and morality an acquisition. Actions were not right because of conformity to some abstract law thought out by some being apart from things. There are not two worlds, one God's world and the other the real world. There is, I thought, only one world, and if there is any God in it he is finding out as he goes along what is right and what is wrong. It seemed to me that the only way in which the extra human world had evolved at all was by the method of trial and occasional success. Nature's so-called plan is like the firing of a load of shot into an open field a million times until you hit a rabbit and then doing it over again. Make a million organs of a million shapes and a million colors and one of them may fit the environment nearly enough to survive. Then do it again. Do it a million times and finally you get a species. That seemed to be nature's way. Not much Providence about that! Not much "eternal beneficence" about that! It seemed to be the same in human history, except where man was reasonable enough to adapt means to an end. Nature or "God" did not adapt means to ends except as "she" or "he" did it in man. "The only intelligence in the universe worthy of the name is the intelligence of the organized beings which have been evolved, and the highest manifestation of the psychic power known to the occupants of this planet is that which emanates from the human brain. Thus does science invert the pantheistic pyramid." This, in the words of Lester F. Ward, had come to be my belief. So, I concluded, it is no use to try to find out what is right by going back to an authority in earth or in heaven. There are no natural rights. We invent rights and after a while they become wrongs, and then we try again and invent new rights.

But of course I was not stewing this broth out of pure ethical abstractions. Long before this I had begun to have an interest in social problems, which grew to be an absorbing interest. This brings me to the third stage of my mental conflict. I had wrestled with the unknowable and learned that that of which theology is surest is what needs most to be called in question. I had struggled to speak out and to act out my disbelief—i. e., I had

wrestled with the ethical question of conformity—and now I tried to find out the real causes of human unhappiness. In other words, I became interested in the social problem. First I became a shallow Utopian Socialist; then I puzzled over the land problem until I "saw the cat" and became an ardent single taxer. Then I learned that the law of rent pertains to other objects as well as to land, and I became a more thorough Socialist. Then I found that the social problem is greater than the economic problem; that side by side with the great elemental social force of self preservation is that of race perpetuation, and following close alongside them both appeared the impulse to social betterment. The desire to live, to multiply and to improve, these seemed to be the great social forces. To understand them, to help make new institutions fit for their expression, these became my aims. But I soon found that "unsound" economic and social views were distasteful in all organizations in which wealth was invested or whose success depended upon the good will of the wealthy. This was inevitable. No congregation or club or society will support one who questions or opposes its point of view. And, on the other hand, a man who accepts support from a society for proclaiming its views is bound to be orthodox to them. So evermore the idea of a paid propagandist became obnoxious to me. To sell my time to a church or to any other organization of propaganda meant to sell to it my freedom.

And no less true is this of a political organization. To become a paid Socialist propagandist would mean to sell one's freedom to the Socialist party. This I could not do. What then should I do? All my training had been for preaching. But I was convinced that to preach truly a man must preach freely, and that meant that he must have a means of support independent of his preaching. Therefore I left professional propaganda to earn my living in another way, so that when I taught or lectured I could do so freely.

That socialism had much to do with my leaving the ministry I do not deny. With honorable exceptions I may say that the religious, semi-religious and quasi-religious bodies with which I had to do were supported by men whose chief interests were vested interests. Economic justice was not one of the doctrines of their creed or their life. On the other hand, I was a Socialist chiefly because socialism seemed to me to be the only way in which economic justice could be realized. Therefore I parted company with these organizations. Had they been more truly the champions of the wronged, instead of lining up on the side of wealth and privilege, my scruples about freedom of thought and speech might never have troubled me. But when I

realized that they were apologists for economic injustice, then it became clear to me that to make my living by preaching views acceptable to them was impossible. In other words, the frame of mind which propagandist organizations cultivate is not the scientific, but the dogmatic. Therefore I left them.

AN EX-MISSIONARY.

Why I Did Not Leave the Ministry

My father was a village carpenter. There were nine mouths to feed by days' work during eight or nine months in each year. He was an industrious, sober, gentle man, but there was no margin above roof, and food and bodily covering. My mother worked hard all day long, and part of the night, to keep her brood respectable and clean. I went to school until fourteen. Then I went to work on a farm "by the month," beginning at five dollars. I worked five summers thus, going home in winter for a few months of school. At nineteen I began to learn my father's trade. I married at twenty-one. For five years I worked at my trade, saving and scrimping to get ahead a little. Then the flood came and carried me away.

From my childhood I loved books. I squandered much time on the cheap stories within my reach. Then I formed a taste for Scott, Dickens and Charles Kingsley. At twenty-one chance brought my way a small library of choice literature—books of history, science, biography and philosophy—into which I dug through long winter days and nights, until at twenty-six I was filled with general knowledge. From my childhood I attended church in a little Methodist meeting house. During my youth I passed through many "revivals" there. I had been taught that I must get "converted" in order to save my soul. I believed this. I tried over and over again to "experience" religion. I failed. I remember now with sensitive nerves the horror of that failure. How all night long I would lie afraid to go to sleep for fear I would wake up in hell. All this when I was only sixteen, a crude, coarse boy. I had dreamed of being a preacher, but the vision vanished and for years the reaction unsteadied me intellectually and morally. Then I married; the little child came; I grew anxious to earn and save money, and my mind turned from religion with indifference. I grew more and more interested in social and political questions; threw myself earnestly into temperance and industrial reforms, and became known as a radical, if not a "crank."

Then at twenty-six one of those mysterious psychical waves shook me through and through. I could not eat. I could not sleep. I could not work. I became broken in courage and nerve. I would leave my work and crawl away and cry. I would get out of my bed at

midnight and walk the room or the street. That period is a nightmare to me now. The sorrow of the world was on me. The old dream came back—the dream of my youth—that I was to be a preacher of the Gospel. My friends discouraged it. Those who loved me thought me beside myself. But there is no help for God's fool. I sold my beautiful house, turned my little belongings into cash, sent my wife and baby to her parents for a little time and went away to learn to be a minister. One year and my money was gone. Then life began over again in a little village far away from the home of my youth. I do not know how those people put up with me, but they did. One woman thought enough of me to mention me to friends a hundred miles away, whose pastor had resigned. Thus a committee came to hear me, and as the result I went to a community of culture and wealth to be pastor of a beautiful church and a well to do congregation. Four years I remained there. It was a neighborhood of factories and mills, a vortex of social and industrial problems. There I slowly came to myself and gradually came to a self-consciousness of my real interest in the Gospel. Long ago, in that flood-tide of misery, where in the dark I had wept my heart's desire out in anguish, there had gone out of me forever the anxiety that had crushed me. I had been obliged to turn my soul over to God to do with me as he willed. Out of the ashes of that defeat rose an absolute faith that the Judge of all the earth would do right with me. From that day I have trusted in a good God and have not agonized over my personal salvation. But the sorrow of the world got deeper hold in me. The call of the deep was in me. My comfortable congregation did not satisfy me. I was unutterably wretched at times. My path was all flowers and friends, but my soul was vexed. I had not found rest. I wanted to be at work where people toiled and bore the heavy burdens of life.

Two doors opened to me: From a beautiful New England city came a rich old man. He invited me to his home and laid before me his plan to build a beautiful memorial church. If I would come as pastor he would guarantee double my present salary and provide me with a pleasant home. The other call was to a poor congregation of a large city, where the church was divided, discouraged and in debt, and where my salary would not be increased, but rent would be added to my expenses. I accepted the latter, and after all these years I am not sorry that I did. It was hard lines at first. They almost broke my heart a dozen times. I had yet to learn that when one makes great sacrifices he must not expect people to understand it. They were cold, penurious, without faith in me or in my work. How I tried to win that people and get a hearing in

that city! How full my soul was with longing to help toward a better day and life! Perhaps I did overdo it. Perhaps my zeal was too hot. God knows I was sincere and in dead earnest. But about the only external reward I got for a long time was the warning of friends and the severe criticism of the community. My church trustees took me aside and scolded me. They told me that if I went on I would kill what was left of the society. All this time I was speaking to all sorts of groups of working people. I visited jails, reformatories and prisons that I might know human misery and help it.

One day the situation became unbearable. I walked the city streets at night, discouraged and heart broken. I went to the door of the home of the chairman of my trustees, determined to resign, leave the ministry and join the army of socialism. To my death I shall remember that hour. I stood there in the dark, all alone, and if ever man prayed I did. I do not know how the decision was made, but I turned away for one more trial of strength with my miserable situation. Among my most intimate personal friends were two men outside my church. One was an old doctor who never went to church. He was a free-thinker, a social radical, and an old saint who worshiped a dead wife in place of God. The other was a college professor. He was a gentle, quiet speaking person, but as brave a man as I ever knew. He, too, was a social radical, as we classify men, but a true, noble, farsighted student of human life. He lost his job at the wink of a trust magnate. To-day he is at the head of the department of political economy in one of our great State universities. These men I took into my confidence. Thus began a closer fellowship between us three, which was broken only by the death of one and the removal of the other. This professor and I went to labor lyceums together. We visited many gatherings of Socialists, labor unionists, municipal reformers, etc. We carried the discussion of social questions into our city ministers' meeting. We became involved in a number of strikes, all but one on the side of labor. For three or four years, with my sympathies all alive and my mind and heart bent on finding out the best place to work for social and industrial righteousness, I tried to understand socialism and the Gospel and compare them. It is twelve years now since the close of that period of storm and stress. My sympathy is still with the overburdened workers of the world. I have no taste for dwelling with the idle, well-fed rich. Time after time I have refused to "move up" among people of wealth and social power. Three times I have turned away from the offer of a pulpit that carried with it a large salary and an open door to an exclusive social group. I love plain folks. I prefer to spend my life with

those who toil. I hate the social and industrial injustice that is all around. If I could I would establish a novitiate of service—of personal, consecrated service—as a condition of full membership in the Christian Church. I am absolutely certain that the wage system and competition as now operated are but one remove from barbarism. I know that they must go the way of all the earth, to give place to some nobler economic system. I am still one of the social radicals of my city and church and sect.

All this, and yet I came out of that struggle convinced that we will never win what we are after through that movement of many phases which we loosely call socialism. I have known personally many of the leaders of this movement. I have invited them to my home and gone with them many times to some corner or gathering where we could thresh out the whole subject. Among the men I have intimately known for years is Charles H. Corrigan, the candidate of the Socialist party for President in 1904. What grew in me out of this contact and study was the conviction that socialism as a movement for social progress is based upon a fundamentally wrong interpretation of history. Socialism insists that history is economic at heart; that progress is the result of changing forms of industry. Selfishness is the dynamic power. Men are never disinterested. Pleasure, self-gratification, in some form is the end. "The man who goes to a saloon for a glass of beer, and you, if you go out to-night to rescue a child whose cry comes to you out of the storm, are both actuated by selfish motives. There is no such thing as unselfishness," is the way Mr. Corrigan stated the case to me one winter's night in my own study. He argued, and as I get it socialism insists, that the difference is simply a difference in culture or development. I grew to see, and still grow to see, that there is unselfishness in the world; that some Socialists are the living example of a philosophy which discredits every theory of selfishness. My study, my experience, led me quickly to discover two classes of Socialists. One class was made up of as disinterested a set of individuals as I ever met. But I have heard these men cheered by a shouting crowd when they uttered sentiments which, if put into operation, would have looted the city where they were uttered. I have now in my desk slips on which a hundred different persons wrote for me, in a meeting of Socialists, answers to this question: "If socialism could be inaugurated, what would be the first and the second laws you would have it pass?" It was in commenting on these answers and this gathering that Prof. John R. Commons, now of Wisconsin University, said to me: "Mr. —, we must moralize this movement, or it will be brutalized."

Here lies that deeper truth which I grew

to see that socialism neglects. Selfishness can never undo selfishness. The spirit that built up social wrong cannot tear it down. Untempered by great elemental moral ideals self may be writ greed, and greed is anarchy in rich or poor. Justice is the larger interpretation of the world's need. How could we invade the realm of capital and reach society as a whole with this human cry for help? Through the moral sense. Through the sleeping idealism of all. I could never get away from then, I cannot get away from now, the conviction that justice, judgment, righteousness, the kingdom of God on earth, is the true battle cry of those who want a better world. And when I came to ask myself where to look for this great hope and how to work it out I found my face turned toward Jesus and my feet going straight to the Church. I thought of St. Francis and the Poor Priests, and read from the pen of Frederick Harrison, agnostic and positivist, that these men were the social regenerators of Europe. I saw in them the reproduction of a nobler personality. The longer I brooded the clearer it came to me that of all the lovers of men and all the social reformers this world has seen Jesus was the greatest of all. I came to see in him the solution of my problem. I turned to him simply as a holy, gracious man, with a passion for individual and social righteousness. Since then he has become more to me. I care nothing for all the speculative theological definitions of him. I simply believe that in some marvelous way he fathomed the secrets of the heart of man, and his way lies the hope of the world. Gradually, how I know not, my preaching grew toward him. I went back to my church humble, trustful, hopeful. There is a long story this side of that day. Slowly, painfully, with many a disappointment, I have led my little flock to the feet of my Good Shepherd. We have transformed one little corner of the world. We have learned to love each other. I have discussed every moral problem between the dawn and sunset, in my pulpit. I believe I can honestly say that I have spoken the truth as I saw it at every step. My pulpit has been as free as any spot on earth. I have had only one set of convictions for private and public utterance. I still meet rebuff. Sometimes some friend is very sore. Often the wish has come to me that I might never again accept money for preaching. I would rather go to my trade than hold my tongue when I feel that I am right. I am more radical, more tenacious, more determined than twenty years ago concerning the necessity for turning some things in this world upside down. Often as these great issues stir me, often as the echo of the world's wo and want sweeps through my soul like the sob of the pine trees that makes me sad, I go down deep in my soul

and lift up from there the spirit of my Lord. I can never get away from him. I must preach his gospel to sinful and sorrowing men. I see no hope except as we grow up into his spirit. Justice will never come, truth will never be done, love will never destroy greed faster than humanity grows up into the life and character of Christ. We must quicken the conscience, stir the will, increase the sympathy of men. The dream of socialism attracts me. I almost see the invisible. In moments of exaltation I almost see that new earth in which dwelleth righteousness. My head is sometimes hot with grief at the slow pace of man, but I know that we must toil and trust and wait. And so I jump no fences, seek no other fairer spot, but here in my place, where I thank God that my lot is cast, I try to win men as my Master did—by love.

A UNIVERSALIST MINISTER.

Why I Left Both the Church and the Socialist Party

Having been for three years a Protestant minister, and for five years a socialist lecturer, I find myself to-day entirely out of touch with both organized Christianity and organized socialism. For the past seven years I have said "A plague on both your houses," and have found no reason as yet to change this opinion.

More than this, I discovered that the same objections apply to both Church members and Socialists. In the following particulars, at least, there is nothing to choose between them:

(1) Both are mere matters of creed. To pass from one to the other is to exchange nothing but phrases. Socialism has its definite plan of salvation, without which there is nothing to be expected but damnation. It has its Marxian Bible and its heresy trials of all who refuse to believe in the verbal inspiration of every chapter. It replaces the Church doctrine of holiness with its theory of "class consciousness." To vote for the Socialist party has been exalted to the dignity of a sacrament. It is the supreme test of faith and fellowship. Socialism is regarded as a fixed and finished revelation, which is to be interpreted and believed, but not improved. The word "renegade" or "traitor" conveys just as terrible a meaning to the devout Socialist as the word "heretic" or "atheist" does to the orthodox Christian.

(2) Both ignore character. My quarrel with the Church began when I discovered that a nonmember who was living a clean and useful life was rated lower than a member who was neither clean nor useful. And when in the Socialist party I found that in this respect I had jumped from the frying pan into the fire. A large proportion of Socialist leaders and candidates for office were drunkards or dead-

beats. While in the Church I objected to the conferring of an honor upon a notorious political corruptionist. "But he is a church member and a liberal contributor," said an older minister. And while in the Socialist party I objected when a worthless sot was nominated for the position of Alderman. "But he has been a member of our party and a faithful comrade for ten years," said the chairman. In both cases my objection was regarded as trivial and out of place.

(3) Both oppose practical progress. While a minister it was supposed to be "none of my business" that one of my church members employed little nine-year-old boys to do dangerous and unhealthy work, and while I was a Socialist lecturer I was expected not only to keep away from all organizations that were trying to improve social conditions, but to denounce them as "unscientific" and "reactionary." I found that the real work of making the world better was being carried on in spite of both Church and Socialism. Ministers and Socialists, generally speaking, are to be found among the enemies of such leaders of social progress as Mayor Johnson, of Cleveland; Governors Folk and La Follette, of Missouri and Wisconsin, and the late Mayor Samuel M. Jones, of Toledo.

(4) Both are based upon enthusiasm, not intelligence. In neither the Church nor the Socialist party did I find any sincere desire for information upon religious or industrial questions. Both abhorred new ideas; both loved best the old phrases in the old way. A "good meeting" was one in which the audience had heard nothing which it did not know before. A "discussion," in the Socialist sense of the word, never means more than a general onslaught upon any unorthodox outsider who ventures to give a frank opinion. The minister or Socialist lecturer to be popular and influential among his fellows must ignore all the really difficult problems and strive only to produce the psychological rapture which comes from drifting along the old and easy lines of thought. As soon as he becomes an investigator he is a heretic.

(5) Both pursue futile methods of propaganda. Granted that the minister and the Socialist have each a message to the world, the simple fact remains that both are unable to

reach the average man. The Church and the Socialist hall are high and dry on the bank, while the current of the nation's life flows past their doors. The Socialist flings many a sneer at the Church because of its clumsy inability to "reach the masses." But after twenty years of frantic effort the American Socialist has failed to win more than three per cent. of the voters. Regularly, every year, his creed is voted down and treated as a nuisance by the American Federation of Labor. The vote of his little party zigzags up and down from year to year. In the entire country there are probably not more than twenty thousand dues-paying members of the Socialist organization.

(6) Both have brought their own principles into popular disfavor. I have no fault whatever to find with the central precept of Christianity—"Love one another"—nor with the exhortation of Marx—"Workingmen of all countries, unite." But I have found that the Church promotes sectarian hatreds and that the Socialist party has again and again divided workingmen and disrupted their trade unions. Both talk unity and promote strife. If they would practice what they preach we would all become Socialists and go to Church. But when we see in both disunion and endless wrangling over trifles, we are obliged to "throw out the child with the bath," as the Germans say. We turn our backs on both the organizations and on the principles they claim to represent.

As for my own present position, I am hoping for a reinterpretation of the wonderful story of Jesus and for a banding together of all patriotic Americans against the present lawless concentration of wealth in the hands of a few multimillionaires. Like thousands of others, I am waiting and working for a new Christianity and a new social system.

A RADICAL OPPORTUNIST.

NEW YORK CITY.

Sickening

We have taken THE INDEPENDENT a good many years, but we have to say that such articles as Gladden's and the "Socialists" are so sickening that we are disgusted with the paper.

J. R. SHELDON.

HORNELLVILLE, N. Y.

Literature

Mrs. Wharton's Latest Novel

MRS. WHARTON'S new novel* is a story of society life, its refined ferocities, its sensual extravagances, its delicate immoralities and, above all, the tragedies which underlie its outward appearance of mirth and prosperity. Society, indeed, is the coming field in fiction for the author who knows how to reap his literary wheat from the tares that are sowed there. And we ought not to complain: These books are missionary efforts of a sensational kind, made in behalf of what is the most corrupt class of people in the world, if we are to take seriously the representations of writers like Mrs. Wharton and Robert Grant.

But there is one curious thing about the dogma upon which these stories are founded. It is that old-fashioned one, "the soul that sinneth it shall die." Now ministers have been obliged to abandon the rigors of this doctrine in the pulpit, or, at least, to emphasize it less; but these novelists dramatize it with all the terrors of their imagination, and they demonstrate it by the life of every character in the story. Thus the men and women in this novel who go about showing their ghastly mirth give the impression of being "hair hung and breeze shaken," as the old preachers would say, over the ancient lake of fire and brimstone. This same class of writers find their ethics by what may be called the dredging process. Formerly we all got our morals and golden texts from the lives of saints and from the Holy Scriptures, whether we were writing or actually living them. But now it is the fashion to get them out of the cesspools of vice. The author who can portray the most sins in the best style is the most popular literary preacher now.

And, according to this standard, Mrs. Wharton should stand very high. She has selected a situation in that circle of society where conditions make for the destruction rather than the development

of honor and virtue. The heroine, a capable, well poised woman, is inmeshed in it. And this is the tragedy—that a creature so morally sane should be subjected to a process sure to prove disintegrating. Her acting, her subterfuges, her pitiful treacheries are simply the threads of a common web which entangles with her every person in her set. She is surrounded by men and women whose esthetic sensibilities are so highly developed that they have become emasculated. Their pleasures are self-indulgences founded upon some social form of almost every vice. Meanwhile beauty is her own spirit's art of expression, just as religion might be a nun's. The need of money, the petty intrigues and delicately veiled temptations which follow, sully conscience and damage self-respect, even if they do not betray the woman to her moral death. And the whole picture is the more distressing than if the victim were a man, because the destroying of a woman means the passing of a finer spiritual nature. The thing must be accomplished with a frightful delicacy which is not so essential in the destruction of a man's character.

We all have the diathesis of iniquity in us, to be sure; but the question is how far right are these authors who prove that the development of the disease depends upon environment? And since it is such an excusing doctrine, it will be easy to inculcate. Then what will be the effect when these people accept it and resign themselves to being the inane creatures of circumstances? If Mrs. Wharton could write a story dramatizing a means of escape for her victims she would do a better business. As it is we would not be convinced even if the heroine marries for love instead of money. That depends upon the author's conception of what the sequel should be in order to make a good story. We know that in real life the woman could not hold out against such terrible odds. The trouble is our literary exponents have a spell cast over their imaginations. Their eyes are

holden. And never since the old days in Greece, when men accepted fate with pagan cheerfulness, has fatalism been so emphasized as it is now, particularly in fiction. The difference is that we lack the pagan cheerfulness.

Some writers have a permanent literary style, others have merely a fleeting fashion of expression, which is not founded upon art and which is meant to appeal to the passing fancy of the public mind. Now some years ago, when Mrs. Wharton's stories first began to attract attention, it was claimed that she had that rare thing, distinction in literary style. And she still has a fine manner, but it is like the fine gowns of her heroines, a fashion of the times for interpreting decadent symptoms in human nature. What she says will not last, because it is simply the fashionable drawing of ephemeral types and still more ephemeral sentiments.

Studies in the Life of Christ

THERE has come about a change in recent years in the method of treating the life of Christ. Farrar, Geikie and Edersheim, Strauss and Renan, B. Weiss, Beyschlag and Keim grappled with the entire subject and sought to set forth in detail explanations of all things connected with Jesus's life and teachings. But in more recent times the subject has not been thus handled *en bloc*. Except for Holtzmann, whose life of Christ, translated by Mrs. Ward, has not received the attention it deserves, the newer lives of Christ have been short sketches or outlines, of which Stalker's is the best example. The problems of the history and personality of Jesus have been left to the writers of monographs, and there have appeared a large number of able discussions of single questions connected with Christ's life, as, for example, on his teaching of the Kingdom of God, his use of the term Son of Man, his relation to the Mosaic law. The work done on these particular questions has made out of date, from the point of view of New Testament science, every life of Christ hitherto written. The thorough student of this greatest of Biblical subjects finds the latest and best work in

small volumes on comparatively small sections of the theme, rather than in elaborate treatises covering the whole ground.

Such a monograph, on a question hitherto not adequately treated, is Dr. Macfarland's *Jesus and the Prophets*.¹ The author examines every direct quotation of Jesus from the Prophets and the Psalms, and every allusion and reference, with a view of determining Jesus's feeling toward the prophets and his conception of prophecy. He distinguishes with good critical skill between Christ's own use of the prophets and that of the Gospel writers, and finds alongside the profoundly spiritual conception which Jesus held a literalistic and rabbinic idea of prediction and fulfilment, above which, despite Jesus's example, his first biographers did not rise. Jesus was vastly greater than his interpreters. Our Gospels are interpretations, and we must go back of them and inquire what manner of man he was whom they were endeavoring to describe if we would know the real Jesus. Dr. Macfarland does this, and, therefore, his study of Jesus's view of prophecy is not only an enlightening explanation of important New Testament passages, but also a contribution to the understanding of the inner life and thought of Jesus. His work is scholarly, thorough, careful and sane and is a good example of what criticism can do in vitalizing scripture. No one should hereafter use Dr. Briggs's or any of the older works on Messianic Prophecy as authorities without parallel reference to this newer treatise.

Mr. Hale's study in the life of Christ,² while also the work of a student, is more popular in manner of presenting results. In some twenty-eight chapters, not without attractiveness from a literary point of view, the author seeks to portray as best he can the personality of Jesus, the "man behind the form." He is certainly right in two important statements, that in large measure the lives of Jesus have been "concerned with the outward events

¹ JESUS AND THE PROPHETS. *An Historical, Exegetical and Interpretative Discussion of the Use of Old Testament Prophecy by Jesus and of His Attitude Towards It.* By Charles S. Macfarland, Ph.D. With an Introduction by Frank K. Sanders, Ph.D., D.D. New York: G. P. Putnam's Sons.

² WHO, THEN, IS THIS? *A Study of the Personality of Jesus.* By Harris G. Hale. Boston: The Pilgrim Press. \$1.25 net.

of his career," and that the Christian world has idealized Jesus with real knowledge of him whom it was idealizing. Mr. Hale has nothing to say of chronology or geography, of feasts or cities, but on the basis of careful study of the Synoptic Gospels he endeavors to set forth the mind and spirit of Jesus. Any attempt at such a task must be tentative and not fully satisfactory, but Mr. Hale deserves respect for serious work and few will read his reverent pages without new insights into the character of Christ.

The Noble Lectures at Harvard,³ by the learned and versatile Bishop of Ripon, are upon the influence of Christ, his work in the world since his death, rather than upon his life and teaching. Dr. Carpenter finds that Jesus has exerted his marvelous influence through his exhibition of the perfect type of religious consciousness as the embodiment of the "law of the soul," and he declares that Jesus has been "verified in experience," and in that verification rests his authority. The thought is worthy and is set forth with exceptional literary skill, with recurring pregnant expressions of much suggestiveness.

Mr. Peyton, a Scotch Presbyterian, holds that the three imperial forces which have made Western civilization are the Incarnation, the Crucifixion and the Resurrection of Christ.⁴ The present volume is on the Incarnation, and while the author is a man of considerable originality and independence of thought he is too much lacking in critical judgment and too fond of large sounding generalities to make his work of value. His philosophical argument for the Virgin Birth, which he explains as non-miraculous, is interesting if not profitable.

Rosadi's work on *The Trial of Jesus*⁵ is rich in information of court procedure among Jews and Romans in the days of Pontius Pilate, but the total absence of

criticism in the use of the Gospels renders it unsafe as a guide in historical study.

The same literalistic use of Scripture disfigures the work of Dr. Andrews,⁶ who regards the present Christian world as almost wholly given over to unbelief and fast slipping into pantheism, which as the culminating sin is hastening the end of the world. The words on the pages look familiar, but the premises and presuppositions are those of another age, an age which even saintly character and pathetic pleading cannot call back from its tomb.

Buell's Andrew Jackson

THE world of books has had many a Hamlet with the Hamlet left out, but here we have a more pathetic case—a life of Hamlet with the major part of Hamlet's testimony left out. Mr. Buell must have devoted years of careful research to his new life of Jackson,* but, while he has gathered hundreds of out of the way records, reminiscences, letters and literature, he gives nowhere any evidence of having used the great Blair collection of Jackson's letters and papers, left by the famous old man himself as an authentic source for the story of his life. That mass of four or five thousand letters was transferred two years ago by the Blair family to the Library of Congress, and several historical students have already had free access to the treasure. Nowhere can the old political autocrat be so intimately studied as in these letters. His own letters and papers with their original bad grammar, bad spelling and testy comments can alone give the real spirit and temper of Andrew Jackson. It is a pity that Mr. Buell has missed them.

In spite of Parton's exhaustive life of Jackson, the new biography contains much new material, tho by far the larger portion of it consists of reminiscences of doubtful value, solicited by the author from old friends and acquaintances of Jackson. How worthless is the attempted

³ THE WITNESS TO THE INFLUENCE OF CHRIST. Being the William Belden Noble Lectures for 1904. By the Right Reverend William Boyd Carpenter. D.D. Boston: Houghton, Mifflin & Co. \$1.10.

⁴ THE THREE GREATEST FORCES IN THE WORLD AND THE MAKING OF WESTERN CIVILIZATION. Part I: The Incarnation. By William Wynne Peyton. New York: The Macmillan Co. \$1.40.

⁵ THE TRIAL OF JESUS. By Giovanni Rosadi. Edited, with a Preface, by Dr. Emil Reich. New York: Dodd, Mead & Co. \$2.50.

⁶ MAN AND THE INCARNATION; OR, MAN'S PLACE IN THE UNIVERSE AS DETERMINED BY HIS RELATIONS TO THE INCARNATE SON. By Samuel J. Andrews. New York: G. P. Putnam's Sons. \$1.50.

* HISTORY OF ANDREW JACKSON. By Augustus O. Buell. 2 vols. Charles Scribner's Sons. \$4.00.

recollection of events that happened thirty years back has been signally shown in the famous instance of the testimony of Adams and Jefferson that the Declaration of Independence was signed by the members of Congress on July 4th, tho we now know beyond the possibility of a doubt that it was not signed until August 2d. Mr. Buell seems to give quite as much weight to such questionable testimony as to a contemporary document. This very confidence in the garrulous reminiscence of old age gives to the book a charm and an interest denied to more critical works. There is hardly a dull page in the two volumes, and while there is little dramatic interest, the mere human details found in every paragraph hold the eye and heart to the end of the book.

The author has very strongly expressed prejudices, especially in all that concerns Clay—"a man who always played for the stake in sight, and who never let a trick pass him, no matter how high the card he might have to play to take it." That, Mr. Buell says, exhausts his ability to fathom Mr. Clay. Calhoun also gets little justice. These prejudices are not alone in proving that the author has made a more careful study of his hero than of the historical setting, the events in which Jackson took part. Much poor history is mixed with some very good biography. The myth of the Mecklenburg Declaration of Independence is still in good standing in Mr. Buell's book. The "Booty and Beauty" accusation against General Pakenham at New Orleans is given full faith. Much that is mere contemporary gossip is treated as well established historical fact. Nevertheless, as a mass of biographical material, pleasantly and honestly presented, these volumes have a real value, especially to the student who can remove the chaff.

One could almost believe that there was a grim humor in dedicating the work "to the embodiment in our times of the Jacksonian spirit, Theodore Roosevelt." Hath an enemy done this? Accepting the popular conception of Jackson, the hot headed, stormy, grimly determined, self-willed and warlike autocrat, one might see malice in the dedication; but, viewed as the author sees Jack-

son, "a plain man of the people and for the people, first, last and all the time," a compliment is intended. In general Mr. Buell's attitude toward Jackson is favorable, tho he is not blind to the mistakes which Jackson made in his treatment of the Bank of the United States and in his unreasoning charges against John Quincy Adams. The author evidently took up this subject at a time when he was a Democrat in politics, and after his transfer of allegiance to the Republican party in 1896 he retained enough of the Democratic spirit to remain an admirer of Jackson.

Freckles. By Gene Strattan Porter. New York: Doubleday, Page & Co.

Although he married the author's fancy, the hero of this story is really the kind of character in fiction which bright, innocent-minded country girls are most likely to appreciate. He is a crippled lad who guards a large tract of timber for a lumber firm. In his loneliness he turns to the birds and creatures for companionship, and we are charmed with many pages of bird courtships and bird bickering, while "Freckles" takes notes. Everything happy comes to pass in the most unexpected and romantic manner. "Freckles" feathers forth first into an ornithologist, then into a lover, and finally into an Irish gentleman of enviable pedigree. But the story is not so ingenious nor so well written as "The Song of the Cardinal," by the same author. She has carried sentiment a trifle too far this time and made it ridiculous.

Beverly of Graustark. By George Barr McCutcheon. New York: Dodd, Mead & Co. \$1.50.

The Lord has been very merciful in providing enough natural scenery on this earth to suit the changing phases of human imagination from the time the first author laid his scene in the Garden of Eden to the present time, when he lays them in the moon or some other place where it is equally impossible to verify his topographical representations. And the latter is a sort of literary ingratitude to providence which is practiced with more and more impunity. Here, for example, is George Barr McCutcheon's new

story. We easily recognize "Beverly," the Southern girl, by her provincialisms, by her charming insolence, and her masterly way of managing situations foreign to her experience by ignoring the laws that would naturally govern them. The princess "Yetive" is, we confess, absurdly artificial, considered as a princess, but singularly like other society women whom we have met in fiction in every other respect. And we have long been familiar with the "goat hunter" type that swaggers and wears a patch over his eye. But where is the principality of Graustark? "East of the setting sun," says the author; and later he says it is "this side of Vienna" and five days' journey the other side of St. Petersburg. Of course, much depends upon the precise longitude and latitude of the place the author occupied when he wrote the story. But not even if he had set his literary compass of directions from Greenland's icy mountains would this location of Graustark seem rational to the average reader. Plainly, he fashioned the whole country out of the hills and valleys of his own imagination; and while he was about it, he fitted every sylvan cove and roadway to the fairy ending of his own story. The "goat hunter" is a Crown Prince masquerading as a beggar. Beverly has no difficulty in becoming a Crown Princess on his behalf; and one feels that the only reason why she did not become a Queen was because the author would not spoil the tale by introducing a character so dull and unenterprising. The book is written in a delightful literary style, and is especially refreshing because the interest is objective.

Off the High Way. By Alice Prescott Smith. Boston and New York: Houghton, Mifflin & Co. \$1.20.

This is a California story. The author paints her characters in with the air of an artist who hurries from one canvas to another, concerned merely to produce the facial expression under a variety of circumstances. It is a curious fact that nearly all writers of fiction in the West see clearly, with a kind of emotional high light, whatever they attempt to portray. And what is more to the point, they cause the reader to see clearly. Thus the characters and scenes in this book are

fixed in the mind, altho the story is of no consequence. When it comes to developing the plot, the author's dramatic instinct is about as coherent as that of a woman shut into a room with a mouse. She whispers mysteriously, and dashes wildly up and down the mountain with her skirts tucked up for action as if the very devil was after everybody in her story. As a matter of fact, this is not the case. The most thrilling thing that happens is where each heroine, in turn, discovering herself to be in love with a man, makes a break for the nearest railway station. They are impelled presumably by a morbid instinct to escape. But why? Would it not be braver to stand firm and flirt the thing out conventionally to a matrimonial finish? And in real life the "man" would not have had the gallantry or tact to head her off in time at the railway station. A man never acts in this melodramatic manner except when some lady novelist is his stage manager. No writer of the year has produced a more absurdly artificial story, and not one surpasses her in literary portraiture and in descriptions of natural scenery.

The Phase Rule and Its Applications. By Alex. Findlay. With an Introduction to the Study of Physical Chemistry by Sir William Ramsay. New York: Longmans, Green & Co. \$1.50.

The phase rule of chemical equilibrium discovered by Professor Gibbs, of Yale, altho it is probably the most original contribution that America has made to science, is not as well known even to chemists as it should be, while the outside world knows it not at all. Except Bancroft's volume there has hitherto been no consecutive account of the phase rule and its numerous applications. Dr. Findlay is more successful than Bancroft in making things clear by abundant illustration and repetition, but the subject is not one which is susceptible of much simplification, so we cannot say that the book is easy reading, but it is accurate and up-to-date, and that is the important thing. If the other volumes of Ramsay's series of text-books on physical chemistry are as good as this they will serve a useful purpose in summarizing a branch of science whose progress during recent years has been so rapid that only specialists could keep track of it.

A History of English Furniture. By Percy Macquoid. London: Lawrence & Bullen, Ltd. New York: G. P. Putnam's Sons. \$5.00 per part.

This work is to be published in twenty folio parts. The first number contains 44 illustrations and 3 plates in color after Shirley Slocombe. Good paper, broad margins, artistic illustrations, and instructive reading matter in large type make this a most attractive book. We have had Lockwood's "Colonial Furniture of America" and Lyon's "Colonial Furniture of New England," but this work goes further back and covers a broader ground. It begins with "The Age of Oak" from 1500 A. D. to 1660. The second period from 1660 to 1720 A. D., is "The Age of Walnut." The next period of fifty years is called "The Age of Mahogany." The fourth period of fifty years is considered as "The Composite Age." This brings the history from the beginning of the Tudor times down to the last of the Georges. The first number is especially attractive, covering as it covers the Gothic period, and is rich with specimens of oak carving. The three colored plates of notable pieces of old oak furniture include a credence, a hutch and a buffet. We might think the color in the plate too red for oak, but we are told that old furniture was treated with a varnish mixed with oil, which in time gave it the color of a ripe chestnut. The other illustrations are all of oak furniture except one, French walnut credence. These old names are most interesting, and the reader will take pleasure in seeing for himself the difference between a hutch and a chest, a credence and a buffet, an armoire, a cupboard and a court cupboard, a coffer and a coffret. These are all simple, almost rude in construction, but dignified by Gothic perforated windows or by hand carving. These half-tones are remarkably well done, and one feels as if the old dust in the corners could be touched with the hand. Chairs were used only by kings and queens, lords and ladies. Common folk sat on chests, hutches, benches or forms. The dossier and canopied chair is represented by twelve illustrations from Westminster Abbey, Christ Church, Hampshire and Kings College, Cambridge. The choir

stalls at Westminster give the flamboyant Gothic and perpendicular design. Christ Church, Hampshire, represents the transition period, being part Gothic, part Renaissance. King's College Chapel, Cambridge, gives the best example in England of Renaissance wood-carving. The provost's seat represents the high-backed seats in Italian palaces. The fixed provost's seat and the miserere seats of the Cathedral give the best examples England has of the free canopied chairs of the sixteenth century, none of which now remain. Detail carved work from English cathedrals is not easily found in our libraries. "Choir Stalls and Their Carvings" from drawings by Emma Phipson, is a very full collection, but only the lower portion of the seat is given. These illustrations are in full and taken directly from the wood. The many examples of linen-fold carving in the old furniture are extremely interesting. Among the old oak panels one is evidently not Gothic, but the design was suggested by old Eastern embroideries, having the leaf and flower forms used in embroidery. This seems to be simply a line drawing with a gouge tool. This book will be valuable, not only to lovers of old furniture, but to art students interested in wood-carving.

The Value of the Bible and Other Sermons (1902-1904). With a Letter to the Lord Bishop of London. By H. Hensley Henson, B.D. New York: The Macmillan Co. \$1.75.

Canon Henson has been much in the public eye because of his plea from the pulpit of Westminster Abbey for the recognition of non-conformists by the Established Church, and also from his frank admission of the rights and the results of the higher criticism. In this volume his views on biblical criticism come to the fore. In sermons which were given the widest publicity he maintains that "there is much in the primitive accounts of the Resurrection which is demonstrably unhistorical," p. 208; that "in all the appearances there was nothing of the nature of a resuscitated body, which could be touched, held, handled, and could certify its frankly physical character by eating and drink-

ing," p. 204; that "the materialistic details were gradually built up into the narratives," p. 205. These sermons and similar views advanced in articles in the *Hibbert Journal* and the *Contemporary Review*, stirred much popular opposition and provoked the Bishop of London to a public attack upon their author. Fairness to Canon Henson demands that besides the sentences quoted above others should be placed, such as "The reality of the appearances of the Risen Christ to the Apostles remains unshaken by the searching criticism of the documents," p. 207; "we can still say with St. Paul, 'Now hath Christ been raised from the dead,'" p. 210; "the case for the Resurrection grows stronger with every Easter," p. 210. The sermons, as a whole, should be read, and their author will be found to be by no means an unbeliever or a disparager of faith, but a devout and scholarly Christian man, familiar with recent biblical criticism, who believes in confiding to the public just exactly what he thinks.

The Second Wooing of Salina Sue. By Ruth McEnery Stuart. New York: Harper Bros. \$1.50.

Ruth McEnery Stuart's last book is a collection of "darker" love stories. She very wisely locates the scenes on a Southern plantation and chooses for her characters negroes in actual slavery or those who are removed from it by only a few years. The white has no artistic conception of any other class of negroes, and if the modern representative of the race ever figures in romantic literature, he must interpret himself. So long as he was merely an obsequious, picturesque figure we had no difficulty in portraying him, as Mrs. Stuart has done in these stories, but when he becomes more like us in his sense of things the whites best able to depict his character lose sympathy with him and are no longer generous enough to dramatize his finer emotions and aspirations. With this need for expression so apparent, it is a curious commentary upon the negro imagination that writers like Dunbar choose white characters for the heroes and heroines of their stories. A fortune, besides fame, awaits the first negro novelist who

writes a great story of his own people. Meanwhile, in this series of sketches, love is a sort of burlesque sentimentality. The dusky heroes and heroines are very much in earnest, but their points of view, their tender passions, even their moral obliquities, are set down so as to appeal to the white reader's sense of humor rather than to his respect. And of course Mrs. Stuart shows one side of the truth. The plantation negro is very different from the educated negro. He is gently primitive, like "cross-eyed Steve," "Salina Sue's" husband; he is a creature of affections and hopes rather than of intelligence or achievement. Many will think that the author has gone too far with her fancy in the story, "Milady," but the accommodating notion of piety upon which it is based is also characteristic of the rural negro. And all the sketches are written in her touching, witty style.

The Holy Spirit Then and Now. By E. H. Johnson, D.D., LL.D. Philadelphia: The Griffith & Rowland Press. \$1.00.

The writer's thesis appears to be this: 1. If thought of as the Paraclete, the Spirit is thought of as a person and should be called He. 2. If thought of as divine energy or influence, the Spirit is thought of as impersonal and should be called It. 3. If thought of as the divine essence, the inmost reality in God, the Spirit is then thought of as indeed personal, but also as sexless, or as he elsewhere expresses it, "impersonal personal." The book gives evidence of much study, yet, as might be feared from the nature of the case, it raises more questions than it answers satisfactorily.

Before the Crisis. By Frederick B. Mott. New York: John Lane. \$1.50.

Apparently it is the plague spots, scamps and fanatics in American history which attract our novelists more particularly. A few years ago Aaron Burr figured in nearly every historical novel of the season, and in such a romantic confusion of villainies as would have turned the head of Satan himself. Now it is John Brown, that diabolical saint and hero of abolition fame. He

has raged like an inspired firebrand of righteousness and destruction in no less than six novels this year. The scene of this story is laid in Kansas during the fierce contest there between the abolitionists and Southern slave holders for political supremacy. "Brown's Raiders" carry on one part of the fierce drama, while mobs of desperate men from Missouri are equally active in opposition. There is an attractive girl, of course, caught up among the difficulties of the situation, who chooses her lover from the wrong political party, and is often obliged to turn pale with fear for his life and her own safety in consequence. It is a thrilling story, however, and well enough told for those readers living too far North to detect the author's egregious errors in representing negro character and negro dialect.

Gainsborough and His Place in English Art.
By Sir Walter Armstrong. Popular Edition. 45 plates. New York: Charles Scribner's Sons. \$3.50.

Few biographies in the space of nine short chapters include so much delightful analysis of the work of a man as Sir Walter Armstrong gives us in his book on Gainsborough. Best of all parts of the book for public guidance is the introduction, in which much of the best modern thought on esthetics is presented in a concise and clear form. There is discussion of the idea that "art is the use for subjective expression of a power which displays itself objectively in what we call beauty," and we are reminded that "mere correctness of imitation holds no higher place in a picture than grammar does in a poem. It is an antecedent condition to enjoyment on the part of audience or spectator, but no amount of it will constitute art." An interesting chapter on the precursors of Gainsborough traces some characteristics of British art back through the seventeenth century to miniaturists of a time even before Hölbein, and considers the possibility of an influence on Van Dyck himself of the English expression of elegance noticeable in the works of Samuel Cooper and others. The English school work is said to show always moderation, or the absence of mere virtuosity; simple

ideas expressed with a single pictorial impulse and a breath of sincere esthetic emotion (and possessing emotion the English painter had to be a colorist) and, third, a kind of objective reproduction which understood feminine charm in all phases as it has never elsewhere been understood. The landscapes and portraits are, properly, treated together, for Gainsborough's art was always that of the impressionist who paints hotly under the stimulus of any vision fitted to appeal, whether in the shape of a lovely scene in nature or a beautiful woman. Armstrong considers Gainsborough one of the greatest, if not the very greatest, of *painters* technically. He admits that Rembrandt was greater in the seriousness of his subjects, but claims that Velasquez only "rendered" where Gainsborough "expressed." In a catalog of works at the end of the book out of several hundreds only twenty-five are listed as belonging to Americans. That seems a small number considering how often Gainsboroughs are seen in New York. The list may not have been revised since the first edition.

Theodore Watts-Dunton: Poet, Novelist, Critic. By James Douglas. New York: John Lane. \$3.50.

This book has the twofold interest of revealing the personality of Theodore Watts-Dunton himself and throwing most valuable side lights on the personalities of such men as the Rossetti, William Morris, William Black, Burne-Jones, Tennyson, George Meredith and George Borrow. About the unique and lovely life of Mr. Dunton and Mr. Swinburne at "The Pines" we do not learn so much, for privacy is part of their code. Many readers of fiction have read Theodore Watts-Dunton's "Aylwin," but very few readers of modern day criticism—except those of the most serious cast of mind—are aware of the great bulk and range of his critical writing. Rossetti said of Mr. Dunton that he "sought obscurity as other folks seek fame;" and certainly the writing of fugitive criticism, buried in the columns of *The Athenæum* and similar periodicals, is a process that might seem to be a safe one to secure obscurity unto oneself. But

there is a certain eternal adjustment which Mr. Dunton could not escape. His personality was evident behind his anonymous writings; and altho few of his admirers would exert themselves to the extent of unearthing all his critiques, they have resurrected many of them, and now Mr. Douglas' record completes the enlightenment of those who want to know more about this interesting man. To Theodore Watts-Dunton praise is due for the origin of the philosophical generalization, "The Renaissance of Wonder," and all that is meant by it in the great romantic revival following the wave of materialism that set in after the publication of Darwin's great book. Indeed, the story of "Aylwin" seems originally to have been named "The Renaissance of Wonder," but this name was abandoned in favor of the less suggestive title.

The Winged Helmet. By Harold Steele Mackaye. Boston: L. C. Page & Co. \$1.50.

The author of that clever book of last year, "The Panchronicon," has again called on his tricky imagination for an improbable tale, convincing as we read. There was a Stocktonian flavor about "The Panchronicon" which is missing in *The Winged Helmet*. Perhaps it would be out of place in an historical novel. The nervous, vigorous style is here and things happen with amazing frequency and rapidity. Like most historical novels, it leaves us with a profound thankfulness that we live in another age with other customs than those of the cruel and brutal centuries of chivalry.

Pebbles

Van X.: "What made Blank blush when I asked him if he was making any money these days? That's a natural question." *De G.*: "Yes; but he's a reformed counterfeiter."—*The Paris Temps*.

LADY CLAIRE.

Lord Ronald bought a diamond ring
To give his Cousin Lady Claire;
He had it charged to his account,
It was a splendid solitaire.

In came Alice the nurse, who said:

"Land sakes, my lady, that's a beaut!
How sad it is my lord is broke—
Say, really, ain't that just too cute?"

"For shame! For shame!" said Lady Claire;
"Oh! what care I, if you must know,
That he is on the hog train since
It happens that I love him so!

"We'll let you come and wash and scrub
And mend his socks and wait on me,
And run the house and cook the grub
To show your loving loyalty.

"Then, hid from all the world, my lord
And I will love day after day
And let his London creditors—
The coarse louts—whistle for their pay."

Back came Lord Ronald on the run
And snatched his ring from Lady Claire;
He'd met a girl from Washington
Whose daddy was a millionaire.

"What means this now?" the lady cried.
"Why have you yanked from me yon gem?
If it's your creditors we'll hide
While Alice empties slops on them."

"Nay now, nay now," Lord Ronald said,
"I've met another who is fair
And has the wish to shine at court
And wants a coronet to wear.

"Her father used to deal in lard
And other products of the pig;
I hate to throw you down so hard,
But, oh, his wad! It is so big!

"My creditors are after me,
My castles are in poor repair;
You're up against it, as you see—
Good-by, good-by, sweet Lady Claire."

They watched him as he loped away
And with him took his flashing ring;
The nurse, at last was moved to say:
"The nawsty, vulgar little thing!"

"Hush! Hush!" said Lady Claire, "it's
tough
To get turned down this way, I trow;
I hope they'll fight like cats and dogs,
And break loose in a year or so.

"My lord was on the hog train ere
He met this beaut from o'er the sea;
When he has made his deal in pork,
Upon the hog train still he'll be."

"Ho, ho!" laughed Alice the nurse; "he, he!
I do declare you gentle folk
Just cawn't hold in when there's a chawnce
To be a-crackin' of a joke."

That day Lord Ronald took to wed
The daughter of the millionaire;
The nurse scared up a loaf of bread
And boiled an egg for Lady Claire.

—*Chicago Record-Herald*.

Editorials

Governor Higgins and the Equitable

IT is difficult to account for the curious disinclination of Governor Higgins to satisfy the popular and entirely reasonable demand for a legislative investigation of the affairs of the Equitable Life Assurance Society. He alone is now responsible for the failure thus far to provide, by thorough legislative inquiry and by the legislation which such an inquiry would suggest, a remedy for the evils that have been brought to light. The Legislature is in session, but for a special purpose, and it cannot take up other subjects unless requested to do so by the Governor. He admits that evils of a very serious character and of great magnitude have been disclosed, but his excuse for refusing to direct the attention of the Legislature to them is that the Legislature of the greatest of our States is not competent to devise a remedy!

It may be that Governor Higgins does not realize how great is the iniquity that has already been revealed. We must go away from New York to learn how deeply the American people are impressed by the record of what Equitable officers, directors and financiers have been doing—to learn that this Equitable case, with its remarkable variety of offenses, has come to be regarded, and justly regarded, as the greatest American financial scandal of recent times. Here in New York the continuous din of shameful reports, of repeated disclosures pointing to one breach of trust after another, of witness after witness confessing to wrongful acts with a callous indifference that excites the disgust of honest men, has dulled the perceptive powers of some of us and so tried the patience of others that they are unwilling to hear more about the foul mess. But the people at a distance see more clearly; they

measure more correctly the size and the significance of the great scandal. They are asking what steps the people of New York are to take for the enforcement of the laws, the protection of hundreds of thousands of policyholders, and the preservation of their State's honor. If Governor Higgins has his way, they will do nothing.

Publication of the testimony taken by Superintendent Hendricks, or of those parts of it that he was willing to give in confidence to another State officer, has, by the disclosure of offenses hitherto unknown to the public, sharply emphasized the need of an impartial and complete investigation. At the same time it has destroyed such public confidence in the impartiality and righteous zeal of the State's Insurance Department as may still have existed. It was not intended that this testimony should be published before the adjournment of the Legislature. Now it is the subject of amazed and indignant comment from one ocean to the other, and experienced legislators of the Governor's party are saying that the Legislature should take up the question at once. Even ex-Governor Odell, chairman of the Republican Committee, whom the public believed to be an advocate of silence and whitewash, because of his relations with prominent men affected by the testimony, now argues earnestly for immediate legislative action. But the Governor stands in the way. He declines to yield because, he thinks, if his thoughts are faithfully represented by what he says, that the Legislature is incompetent.

This testimony relates to shameful transactions that were not mentioned in the report which the Superintendent made and published after the witnesses had been heard; to the diversion of millions from the Equitable's treasury by dealings in banks, trust companies and stocks; to syndicate promotions of great issues of new securities by direc-

tors who were at the same time officers of the companies issuing them; to the purchase of securities from directors and the following sale of the same securities to the same directors at lower prices; to the sale of trust company stock to directors at \$500 a share at the very time when the Equitable was buying it at \$1,000; to similar sales of other shares at \$500 when the Equitable was paying \$815 for them. These are merely samples of the contents of a transcript of testimony that fills five closely printed pages of a newspaper. There is also the repeated assertion of so prominent a director as Mr. Schiff that the company's official record of dealings with his banking house has been falsified.

No part of these new chapters of the Equitable story is more interesting to the average reader than that which touches upon the annual salary of Senator Depew (for many years a director) and a loan granted to a corporation in which he was interested. For the Senator's long explanation of the reasons which led him to accept \$20,000 a year from the company for some thirty years we must refer our readers to the published verbatim report of it. To us it is not satisfactory.

Concerning the loan of \$250,000 by the Society to a corporation, the Depew Improvement Company, in which the Senator was largely interested, there is room for only one opinion in the minds of good men. Upon property appraised by the Insurance Department at only \$150,000 this loan of \$250,000 was granted. The Senator remarked that as a member of the Executive Committee he voted for making the loan, altho as counsel he had given no advice about it. He wrote to the Department for a new appraisal, because the first one was "ridiculously below the real value," and a new valuation of \$393,000 was made. The company got in a bad way, and the Equitable had to foreclose, realizing only \$54,000 upon its claim of about \$275,000. It appears, therefore, that the original valuation of \$150,000 was neither low nor ridiculous. Mr. Depew admitted, and others testified, that he had given the Equitable a promise that he would protect it against loss in this transaction,

and at the same time he added that his promise was not legally binding!

He was receiving \$20,000 for acting as counsel, he says, for the funds upon which widows and orphans relied. As a director, also, it was his duty to guard those funds carefully. But, being both counsel and director, he voted for this loan of \$250,000 to a corporation whose property had been officially appraised at only \$150,000 (a corporation bearing his name and in which he owned a large interest), and then, having guaranteed the loan by his own promise, he repudiated his guarantee when great loss was at hand and (as counsel, we presume) informed the Society, his client, that the guarantee was not legally binding! Mr. Depew must have a very elastic conscience if he can make it approve his conduct in this case. It is partly on account of this loan that we find his explanation about his annual salary unsatisfactory.

Public confidence in the Equitable and in the life insurance business in New York can be re-established only by thorough official investigation and by legislation. A searching inquiry would show clearly what new laws are needed, and it should precede the making of them. In the case of the Equitable a just mutualization must depend in part upon action of the Legislature. There should also be a legal standard for investments and some restrictions as to connections with subsidiary companies. Investigation would disclose the persons who ought to be prosecuted, if such there be. If any director or officer has defrauded the Society, he should have no more consideration than was given last week by Judge Foster to Neumer, the young clerk of the same Society, who was sentenced to be imprisoned for assisting in robbing it of \$52,000. The inquiry should begin at once.

We cannot understand why Governor Higgins has so stubbornly refused to take the action to which he should have been guided by a clear perception of his duty. Some have thought and said that he is restrained by fear of new testimony that would affect persons not touched by the evidence now known. Can this be true? We do not believe it is. And yet, if he persists in his strange course, this

will be the explanation accepted by many to account for obstruction that now promises to end his political career in the near future.

The Business Freebooter

HAVE we reason to suppose that the moral conditions disclosed in the directorate of the Equitable Life Assurance Society are exceptional? In paying themselves enormous salaries, fees and "rake-offs" for nominal services, out of money which thousands of men without fortune toiled to earn that they might provide for wives and children, were the Equitable officers worse than a multitude of American business men in this generation?

We hate to say that they were not, because, the longer one thinks of the real quality of their conduct, the baser it appears. And yet, looking over the field of corporate business in a cold-blooded way, is it likely that these gentlemen of the Equitable Society were greatly different in character and conduct from men of their class that might be found in the offices of any big corporation between New York and San Francisco? As a proposition in sociology it does not appeal to the mind as scientifically improbable. Moreover, whenever the lid has been lifted, in Boston, in Philadelphia, in Chicago, in St. Louis, in Milwaukee, similar conditions of dishonor, corruption, heartless extortion, have been disclosed.

And what unspeakably shameful conditions they are! Men of wealth and economic adventurers; men of education and men of the coarsest vulgarity; smug, praying hypocrites of every denomination and blaspheming scoffers of every argot—all tumbling over one another to rob their fellows, to betray trust, to defy public decency, and all for what? For money! For money in dimes and in dollars; money by thousands, or money by millions; money more or less; money in any form, so long as it is—money! It is not a pleasant picture. If it is a true picture it means that a part, at least, of the American people has become as rotten as any people that has lived and spawned since the days of Sodom and Gomorrah.

What is the cause of it all? Americans

are supposed to be the offspring of men that cared rather more for morality than their licentious contemporaries did. An astonishingly large proportion of American business men are of Puritan ancestry. Possibly three-quarters of them have had a religious bringing up. Their fathers, on the whole, were honest men in their day and generation. Their mothers were respectable, church-going women, who believed in the elementary virtues. Why have the offspring of such forbears become the ruthless economic freebooters of to-day—worse than pirates, because greedier and meaner?

The American business freebooter is probably not at heart worse than the common run of embezzlers, forgers, incendiaries and murderers. Indeed, within a narrow range, he is capable of sympathy and generosity. Like the professional thief he is often "good to his family," and he often treats his man servants and his maid servants with liberality. He provides swept and garnished stables for his horses and hygienic kennels for his dogs. The lack, therefore, does not seem to be on the side of elementary softness of heart. Apparently it is almost wholly on the side of the moral intelligence. Altho he can sneer finely at the economic theorist, and likes to ask with cool cynicism if the socialistic reformer supposes that the State can legislate wealth into existence, the business freebooter himself seems to believe that his own wealth has been created out of nothing, by the word of his power. His imagination does not picture the toil, the struggle, the anxiety, the heart-break of the unnumbered thousands of plain men and women, whose savings for a rainy day are flipped over into his bank account by a clever deal, or are extorted in prices, or in insurance premiums, two to ten times as large as they would be if he were an approximately honest man. He has intelligence of a certain kind, but not of the kind to grasp the facts of social relationship, of the right and natural claims of his fellow men.

If now we ask the further question why the business freebooter's intelligence remains on this side so embryonic, we suspect that the answer is, because he has not as yet developed the social, or communal, or public sense. The idea is not

new. Aristotle, it will be remembered, was of opinion that the business classes are unfit for citizenship, because their minds are too much absorbed in their own precious—pecuniary—affairs. Landowning gentlemen, often holding office as magistrates or otherwise, may learn to see things from a public viewpoint. The military class, accustomed to hold itself in readiness for any sacrifice in the public defense, acquires disinterested public spirit. The professional classes, too, by virtue of intellectual training, develop an interest in large affairs and in the social welfare. These classes are fit for citizenship; not because as mere human beings they are intrinsically better than business men, but because, from the character of their pursuits, they have acquired a social or public sense.

Two milleniums have fled since Aristotle wrote and in that period, short as the evolutionist measures time, large numbers of business men have acquired social sense and have become exemplary citizens. It would be unnecessarily pessimistic, therefore, to conclude that the business freebooters will never change for the better, that they will never learn to picture in imagination the struggles and feelings of the fellow creatures whom they exploit. Optimistic, even when we contemplate the morals and the manners of the American business freebooter, we hold it possible that he may one day develop honor and common honesty, and so, in the long, slow course of evolution, become, in spite of Aristotle, fit for the privileges and the responsibilities of American citizenship.

The Escape from Responsibility

OF the apologies given in this issue of THE INDEPENDENT by those who remain in or who have left the ministry we think it important to discuss but one, that of the man most radical of them all, who has rejected all forms of "professional propagandism." He has such an apprehension that he will be put under obligation if he takes a salary for service in behalf of any cause, religious

or social, to defend and support it, as will interfere with his liberty to change his views, that he remains a free lance.

We are not surprised at his fear, for he is in much more danger than are most men. A Congressman representing a party can have, generally, the assurance that he will not suffer any serious change of political faith, and so he can continue to take his annual salary until he serves as long as did Senator Hoar. So John Mitchell can feel that his doctrine of capital and labor is settled, and he has no difficulty in taking his salary. And equally there are many thousands of others, in the churches and in political and social life, who are not troubled by the anxiety which affects our correspondent. Why should they? Perhaps they have ceased to raise old questions; perhaps they raise them to answer them still in the same way.

But our correspondent is of a different temperament. He has suffered many evolutions. He began with a heterodox orthodoxy, which faithful reading of Jonathan Edwards would have cured him of, or, rather, would have saved him from, that God's will is the basis of virtue, duty, of right and wrong, and that, accordingly, as God is the center of all things, all life is to be centered about God. Then he changed his view and accepted the doctrine of essential right and wrong, independent of God's will. Then he changed again and concluded that duty is not essential, but relative, conditional, developed with the evolution of things, and dependent on use and custom. Equally he changed his doctrine of Theism. He began with the great All in All, the supreme creative God. Then he gave up the divine activity and control, then gave up the miracles of the Old Testament, then those of the New; then gave up, necessarily, Jesus as a peculiar expression of the character and will of God, and finally reached the position in which he lingers at present, that we know nothing of God, know not that there is any God; only know that the men we see think and feel and will. He believes in Man, the Father of all the might he knows of. Equally he has been changing his sociological views. From the belief that man's chief end is to

glorify God he passed to the thought that it was God's duty to glorify man, and so not to condemn him to future suffering. Then, as God receded and man advanced, he went through the succession of socialistic progress, single taxing and common ownership, and now he has outgrown socialism with its economic panacea, and he is resting—or roosting—with those who resent legal restrictions as to how to “live, to multiply and to improve.” If we can gather his present position, or, we should say, drift, it is in or toward absolute anarchism. But it is liable to change and develop or recede. We think that such a man does well not to put himself again under fetters of conformity. He has already been an evangelical minister, a foreign missionary, a Unitarian preacher and an advocate of Henry Georgeism and of various schemes of socialism, if not of anarchism; and he is not yet an old man. He should remain his own master.

What a pity that a man should begin as he did with the philosophy, “All duties I looked at as ordained by God,” a notion which destroys the goodness of God by identifying God's goodness with his wilfulness. If so, God might damn whom he pleased, for whatever he might will would therein be right. It is not strange that with such a starting point he passed over to the strange conclusion that God is not good. How unnecessary was his conclusion that evolution eliminates God; that if there was suffering there was not a good God. Most of us, men of science as well as theologians, see no contradiction, and indeed they ask whence came this order of existence and nature which is subject to law and evolution.

But what most concerns us is his lack of any sort of anchor to which he can hold. God or no God, is there not *Man*, the great Humanity, with its suffering, with its tasks, with its advancement? Are there not human duties and human rights? Are there not obligations of man to man and man to woman and child? Does not ethics rest solid yet? And even so, does there not remain the duty to make the world better, and so the force of that spirit which led him to the foreign mission field and which ought to make a propagandist of every

one of us? Take away Christianity, take away Theism, and you have taken away tremendous influences for altruism, but you have not removed the basic principles of duty, of love, which Jesus preached and which, well understood, would make missionaries of love and civilization and righteousness and character out of the veriest Agnostic or Atheist. They do sometimes; we hope they still do and will in our correspondent.

The Henpecked Husband

FROM time to time we have opened our columns to the feelings, opinions and woes of women in regard to the marital relation. And there has been no dearth of material. The “Bachelor Maid” has told why she did not marry, the “Childless Wife” has explained why she did not have children, and the mother who had so many has made it perfectly clear that she did not regret what she had done. The down-trodden Illinois Farmer's Wife has given a complete exposition of her husband's cruelties, and in this issue the sorrows of a preacher's wife are set forth in a way to harrow the feelings. That is to say, the women have done the talking, and it is hard to tell which class have been the most voluble, the self-protecting ones in their explanation of why they will not suffer and endure the ways of men, or those who have evidently endured them too much, or those serener ones who rejoice in their trials and blessings. Meanwhile the slandered man has preserved a silence which is either dolorous or discreet.

Naturally no one expects the childless husband to say anything, because there is nothing proper for him to say. But what of the “henpecked” husband? Far be it from us to invite his confidence on so delicate a subject, but as a matter of psychological speculation why is it such a man so rarely unfolds his tale of woe? Indeed, we should like to hear from him. There are such husbands. We recognize them in every circle of society, but did any one ever hear a husband *admit* that he was “henpecked”? Some women take a mournful pleasure in retailing their marital grievances, because they are sure of a measure of sympathy, but the “henpecked” husband

never tells; first, because he is ashamed of his condition; second, because he knows that his complaints are apt to excite mirth rather than compassion. Thus his "cock of the walk" manner in society, assumed to conceal his pitiable state, is one of the most patent symptoms of his case. How often have we seen some little Jupiter man hurling his thunderbolts into the conversation with a Dominique fierceness grow suddenly and feebly silent at the entrance of his Mrs. Juno! She may be thoroughly unconscious of him, and he may not confess her presence by so much as a glance, but her very aura stifles him. And every one with comprehension may see him creep down and cower within his hiding place of a body.

Then, again, it is some little sparrow wife who openly hectors her big husband. How she manages it no one knows, but we have seen her lead a man around by the nose who would charge into a cannon's mouth, lead a rebellion, or browbeat a Senate chamber full of opponents. She is not pretty and there is no coquetry in her methods. She comes straight to the point, with a level eye and a quickening tongue, and the man, however intelligent, distinguished or successful in the world outside, flinches, turns tail and *runs*.

And there are other husbands who have troubles of their own. They do not take European tours, for the same reason that "Mrs. C." does not. They are not asked. They are not wanted by their better bred (?) families. Often this kind of husband cannot afford the expense except for his wife and daughters. He is the money-making machine upon which the realization of their social ambitions depends. He is not simply hen-pecked, he is "plucked." But no one will see an anonymous article from him rendering a scale of his household's extravagances, and his sister-in-law will never run upon him pouring out his sorrows to his "heavenly Father." He has such a God-forsakenly hard time that he has forgotten to recall a heavenly Father. He has materialized into gold, and he only keeps his spirit for the profane purpose of swearing. Nothing is harder, colder or more pathetic than such a man—an old, furious, grubbing fowl,

plucked to death by his engagingly pretty wife and daughters.

School Gardens

THE school garden has grown up as an adjunct of the common school without any preconception of its relations to a system—hardly with a thought of its industrial tendencies. It has been a spontaneity of the age—an emotion of the times. It is now beginning to appear in its proper place as closely related to a general industrial movement in education. The world is coming to a conviction that education must take in the whole being; that the hands especially must be trained to enter into full accord with the brain. At the same time a reaction has appeared against muscular uselessness and a mere acquisition of learning in storage, without power to apply or utilize it. Labor is more in honor. Mere work is the best thing in the universe that we have yet found out. "My Father worketh hitherto; and I work." The school garden, employing the hands, has done a full share in bringing about a great social evolution.

We owe the first impulse in the way of associating the school and the garden to Arbor Day. The idea came to us from Nebraska; but garden schools are now common in the East and the South, and even in our insular possessions. They are maintained in connection with every grade of schools. The most important fact is that they are no longer considered as pleasant accessories, but as closely associated with the fundamental ideas of instruction. Not less than a dozen of our agricultural colleges have prepared school garden plans; while they are actually in operation in connection with fifteen or twenty normal schools. Young people preparing to enter upon teaching as a profession are expected to prepare themselves to go into our rural schools not only with a sympathy for nature study, but with a capacity for leading the boys and girls on our farms in the primary sciences. These sciences, such as entomology and botany, underly modern farming. Minnesota has led the way, requiring of the incipient teachers work in the garden and orchard, while careful

notes are taken. Two of the normal schools of Massachusetts have also incorporated school garden work in their training, and it is made the basis for exercises in mathematics and drawing. Connecticut has a School of Horticulture at Hartford, and there are school gardens in connection with the normal school at Willimantic. One of the Vermont normal schools maintains an experimental school garden, with co-operative flower and vegetable growing. Instruction is given in the use and effect of fertilizers. The normal schools in California and Utah are also working in the same direction. This is a very important feature of the movement, because if we cannot have our teachers trained both in the practice and in the love of nature studies our schools will lack at the top while we are trying to infuse the true spirit at the bottom.

The association of flower and vegetable gardens with the common school began in Massachusetts twelve years ago or more in connection with the George Putnam Grammar School. The work started with wild flowers and ferns, but for the last four years vegetable gardens are prominent features. At present not only the Boston schools, but the New York schools and St. Louis schools, in fact those of nearly all the larger cities, are engaged in cultivating vacant lots. East Dedham, Massachusetts, employs a landscape artist, whose business it is to direct the boys and girls in planting shade trees, shrubbery and playgrounds. They will go so far as to create a botanic garden. Here, as in many other schools, each pupil has his individual plot. The School of Horticulture at Hartford apportions for each boy and girl a garden ten by twenty-five feet for first year pupils; others, ten by thirty feet, for second year pupils, and ten by forty for third year pupils. The teachers also have their own gardens. It is understood in this sort of education that the teachers are at school as well as the pupils. They are at work together—to find out, discover and learn the truths that have heretofore been considered out of the sphere of school life. The report is almost universal that the children work in these gardens like Trojans and are learning with immense rapidity. They

do not forget, nor do they show signs of tedium. In the toughest neighborhoods of the large cities just as much zeal is shown by the pupils and women teachers are as safe as in their own parlors. The ethical result is fully equal to the intellectual.

The Home Gardening Association of Cleveland is leading the work in that State, while the work is spreading from the schools to many private institutions that employ boys and girls. The National Cash Register Company at Dayton, Ohio, furnishes gardens and instruction for seventy boys. In St. Louis the work is at fever heat, under the direction of the Civic Improvement League. This league is permitted to use all the land it needs from a one hundred and sixty acre tract. Nearly one hundred gardens are already laid out, in size eleven by one hundred and sixty-five feet. Any boy in the city can have a plot, free of charge, on application. They must come, in classes of fifteen, one morning of each week, to receive instruction. The citizens are taking a deep interest in the movement and providing funds for as many as will apply.

In Yonkers we have a fair example of the zeal which is awakened among our smaller cities. A block, one acre and a half in extent, was secured, surrounded with a fence and furnished with a tool-house. Two hundred and forty gardens were laid out, and the boys were invited to take hold. Three hundred immediately responded. The gates are unlocked at eight in the morning, and a host of boys are always ready. From that time until the garden is locked up, at six o'clock, there is a scene of unremitted activity. The rule requires that work be done at least two days in the week; but the majority of the boys work every day, and do their work well. Blank books are furnished and every boy must keep record of his work and the consequences. A large amount of freedom can be exercised in all such gardens, altho a superintendent or teacher must not only direct the work but have restraint on the digging of plants. A curious fact is reported that, whereas depredations on fine gardens were formerly common, now the owners can rest in peace; the robbing has entirely ceased.

The ethical result can be stated in the words of the superintendent: "Not once during the summer did a boy have to be rebuked for any cause whatever." And there was no vandalism from outside either! A perfectly democratic spirit prevails. The rich assume no airs; but the barefoot boys, who are most successful with vegetables, take on a slightly superior manner. There is so much fun in this sort of work that other plays are neglected, especially the mischievous.

We must be blind not to apprehend the fact that we are entering on a new age of school enterprise. Education is being industrialized. The agricultural college is to be the center of a State system which educates the hand together with the brain. The physical result will be very important, and, as we have seen, the moral consequences will be quite as marked. It seems specially important that the drift shall be understood as soon as possible. Our high schools or town schools, which are rapidly absorbing the old district schools, should not be built on the street side, but in large plots of land. These are easily obtainable everywhere outside of large cities. Our school authorities must also be prepared to see a part of each day set apart to garden work—that is, to applied studies. We are nearing the day when there will be no longer any complaint that our farm boys are educated away from the farm and out of love with plant life and animal life.

By making speeches,
 Mr. Lawson's Mr. Lawson has lost a
 Advice part of the popular
 strength which he gained by writing. Much that he has said to Western audiences has been entertaining, and a part of it was true, but the intelligent Western farmer's opinion of his remedies for the evils of "the system" will not differ widely from the Eastern merchant's or the Eastern broker's. Municipal or Government ownership is not in any sense a remedy, he says, because "the system" and the "frenzied financiers" would like nothing better. But Western farmers and the people everywhere know that this is not true. The capitalists whom Mr.

Lawson is attacking are notoriously hostile to every movement for Government ownership of public utilities. His remedy is the sale by the American people of every share of stock and every bond they now possess "back to the frenzied financiers at present inflated prices." This is the advice he has been giving for a long time past, and those who were induced by it to sell some months ago are now sorry. If the suggestion of such action as a remedy for all the evils of which he speaks really deserved serious consideration, it might be pointed out that those whom Mr. Lawson was addressing have few shares or bonds to sell (altho they are not poor); that if there should be such a general sale, the "present inflated prices" would melt away so rapidly that only the early sellers would know much about them; that "the system" would get at bottom prices such shares as it desired to have; and that the fall would yield a rich harvest to a certain class of speculators, especially to any one who could foresee or start it, if he should "go short of the market." Even Mr. Lawson, an expert trader for either the rise or the decline, might yield to temptation and capitalize his advice. There will be no universal selling when he "gives the word"; but if there should be, both the guilty and the innocent would suffer in a widespread and disastrous panic. There are some old-fashioned remedies which Mr. Lawson should think about, such as the enforcement of the laws and the election of honest men to legislative and executive offices.

Miss Margaret A. Haley,
 "Terrorized" who represents Chicago
 Teachers teachers and has organized
 them into a sort of labor union, and has done good work in city reforms, sends out a circular severely opposing the plan to centralize the National Educational Association. She concludes with this remarkable assertion:

"There has been afoot for several years a powerful, persistent, silent and largely successful conspiracy to make a despotism of our entire public school system. State boards of

education have demanded, and in some States have obtained, almost absolute control of the public school system. Local boards of education, themselves appointed and not elected, are made corporations with powers superior to the city government. Superintendents generally are demanding, and have frequently been conceded, autocratic powers over school boards, courses of study, selection of text-books, and the appointment, promotion, transfer and dismissal of teachers. The result is that teachers fear to protest against 'fads and frills,' against what they believe to be wrong and injurious educational methods, or even against 'graft,' for they know that any such protest is certain to result in forfeiting all chance of promotion, if it does not result in persecution and professional ruin, as is often the case. It is safe to say that with the exception of a few specially enlightened communities there exists to-day in America no such thoroughly terrorized and oppressed body of men and women as our public school teachers. . . .

"The whole tendency of school administration in the United States is toward 'centralization,' and this is the policy that is now being forced upon the National Educational Association. Who is responsible for this policy of centralization, and what is its purpose? From every quarter comes the suggestion that great commercial interests are at the bottom of the movement, while many calm thinkers believe that it is actively promoted, also, by certain institutions of learning which are interested in propagating doctrines agreeable to their founders and in strangling the propagation of disagreeable doctrines.

"Our public school system has become a veritable 'Golconda!' a 'mine' to be 'worked for all it is worth!' and the interests that would exploit, and are exploiting, it find it far easier to handle a well organized, central, despotic machine than to manage the great body of principals and teachers and the people at large. The latest move in the game is the scheme to obtain control of the National Educational Association."

This is startling enough; but we presume Miss Haley has found something of a mare's nest. If things are in this way teachers not from Chicago will find it out and not consent to be terrorized and victimized.

Union for
Christian Endeavorers

A Methodist editor of THE INDEPENDENT, Edward Eggleston, organized in Brooklyn a church which he called "The Church of the Christian Endeavor," later called, we believe, the Elm Place Congregational

Church. But the name did not perish. It was taken up by a humble young people's society which the Rev. Francis E. Clark organized in his mission church in Portland, Me. Other churches took up the plan and the name, until now it has spread all over the world, and the Young People's Society of Christian Endeavor has four million members, tho but twenty-four years old. It is now proposed to celebrate its quarter century, during the lifetime of its founder, by raising a fund for a central building and headquarters, which should bring in the few thousand dollars of income necessary for the expenses of travel and management. Unlike the Young Men's Christian Association, the Y. P. S. C. E. has no buildings, no funds and no money backings. All that is proposed now is that each active member should contribute twenty-five cents for this fund. It ought to be done, and it would be a great relief to Dr. Clark, who has no princely salary, but has paid the most of his expenses by writing articles and books. If the energy which he put into the Christian Endeavor had been put into a life insurance company, one can guess what his salary would have been. But the best monument to him is the Society itself and the other societies which evolved, or, rather, seceded from it, the Methodist Epworth League and the Baptist Young People's Union, the Luther League and other societies. Dr. Huckel said, at the great Convention in Baltimore, that they all ought to come together, and last week the Baptist *Examiner* said that many Baptists think so too. Nothing but denominational pride—and publishing business—stands in the way. Why should not the hymn John Hay wrote for the Christian Endeavor suggest the reunion? It begins:

"Lord, from far-severed climes we come
To meet at last in Thee, our Home.
Thou, who hast been our guide and guard,
Be still our hope, our rich reward."

Georgia
Justice

That was a great day for lynching in Georgia last week when a mob took nine men out of a prison, eight black and one white, tied them up against fence-posts and shot eight of them dead. One of them was only wounded and feigned death. And

this is a civilized country! But if Georgia marksmanship is failing, the sense of social privilege is yet maintained. In a small South Georgia town it is the rule that at a public trough a horse or mule owned by a negro can drink only on the left hand side. Lately a negro bought a spirited horse, paying all but a dollar, and let it drink at the right hand side, which was all right, as it was supposed it still belonged to the white owner. But when it was found that the negro had bought it he was arrested and taken to the Mayor, who declared that as the price was so nearly paid the negro was the owner and must pay a fine of forty dollars or go to jail. He said that then he would go to jail, but the Mayor-judge then refused to allow it and ordered the horse sold at auction for the fine, and pocketed what was over for costs. Thus in one way or another can dignity and justice be maintained.

Exactly what is the meaning of the first decision made by the Papal Biblical Commission it would not be easy to say. This is the question put to it:

"Is it lawful for the Catholic exegetist to solve the difficulties occurring in certain texts of sacred Scripture, which appear to relate historical facts, by asserting that in these we have to deal with a tacit or implicit quotation of a document written by an uninspired author, and that the inspired author did not at all intend to approve or adopt all of these assertions, which cannot, therefore, be held as free from error?"

And this is the beautiful answer which the Commission has given in sounding Latin:

"In the negative, except in the case when, due regard being paid to the senses and judgment of the Church, it is proved by solid arguments—(1) that the sacred writer has really quoted the sayings or documents of another; and (2) that he has neither approved nor adopted them, so that he may be properly considered not to be speaking in his own name."

That is, let there be "solid arguments" that documents were really quoted from "J" and "E," and that the compiler does not say that they are true, and then No may become Yes. There is liberty enough for any higher critic—only it does not sound so.

Until the Perdicaris matter we had not for a hundred years had any particular interest in Morocco; and in our vigorous demand for Perdicaris alive or Raisuli dead we treated with Morocco through France as intermediary. Now it may be that in the international conference the United States will have part. At present ours is a waiting attitude until France and Germany have settled their preliminaries. The explanation of Germany's insistence is, that it is well known there that the Socialist faction of the Bloc will under no circumstance countenance any military action in Morocco, or preserve French interests there, except in the case of war with Germany. Accordingly the Kaiser can press the subject as otherwise he could not have done. Again we are likely to take part in an international conference of the sort that prepares the way for the later permanent international Parliament sure to come by and by.

A quotation from Laurence Hutton's "Talks in a Library" is timely:

"Mr. John Hay once told me that while listening to a somewhat dull sermon from a preacher with whose views and doctrines he was not altogether in sympathy it suddenly occurred to him, *apropos* of something he had heard in the discourse, that, after all, perhaps 'Saving a little child, and bringing him to his own,

Is a derved sight better business than loafing 'round the Throne.'

"And out of this fragment of cloth was cut the 'Little Breeches' which are not soon to wear out! In the same way, he added that some sentence in a long, impromptu prayer gave him the impression that, maybe, in the end,

'Christ ain't going to be too hard
On a man that died for men.'

"And on this pedestal was erected the statue of the famous 'Jim Bludso' of the steamer 'Prairie Belle,' who gave his own life to save the lives of the passengers entrusted to his charge."

The American Consul at Newcastle, New South Wales, reports that the old age pension act has been in operation there for five years and that it is not working well. The Federal Parliament has appointed a commission to consider whether such a law should be enacted

for the whole of Australia, but it finds the evidence hardly favorable. The director of the Government asylums for the infirm testified that on the passage of the act in six months 600 old people secured pensions and left the benevolent asylums, but that the majority returned and surrendered their pensions; so that now there are almost as many inmates as before, with no increase of population, while \$2,500,000 is expended annually for old age pensions.

The Pacific Coast is not all for Chinese exclusion. The Portland, Ore., Chamber of Commerce has, through its President, sent a letter to President Roosevelt asking for a modification of the present law. They say that the fear which thirty years ago led to the drastic legislation has now passed away, and experience has shown that it was without warrant. They would allow free entrance, with no exacting conditions to students, merchants and professional men, with perfect freedom to visit their native country and return, and the free admission of Chinese laborers, who are much needed, to the limit of 70,000 a year. This shows that light is breaking in the West.

The proposed bill for the settlement of the difficulty in the Scotch Churches allows any Church to modify its creeds without such change being submitted to Parliament. But this was not made to apply simply to the United Free Church of Scotland, but also to the Established Churches in both Scotland and England. One would think that the Nonconformists would rejoice to have such liberty allowed, but, somewhat selfishly, as it would seem, they protest that a Church established by law should have no such freedom. They seem to wish to make the position of the Established Churches as disagreeable as possible, so as to hasten disestablishment; not a generous attitude, and hardly wise in the long run.

It seems clear that the present Pope is ready to break from the intransigent attitude of his predecessors and find a basis for friendly relations with the

House of Savoy. It may be that the Papal States were seized by violence; but in a course of years possession becomes fixed and restoration is a new wrong. It is of no use to fight the inevitable. The people of Rome want civil and not Papal rule, and so the Pope must submit, and all the world will approve. Already he allows good Catholics to vote, so that as a lesser evil they may support the Italian Government against Socialism. The new policy will make friends for the Church.

At last Commander Peary has sailed for the North Pole, and America wishes him good luck. He takes the best known route, goes immediately to the north of Greenland, and then will sledge it, if possible, to the Pole. Generous contributions have been made, and it is for a most worthy and most useless project. He promised once that he would never go again, after his fourth or fifth voyage, but how could he help it?—he had the Arctic fever. "*Mox reficit rates Quassas.*"

Our readers remember the recent article we printed by Professor Dennis, of Smith College, in regard to the unique municipal theater in Northampton, Mass. We have since learned that Red Wing, Minn., also has a municipal theater. It was donated by Mr. T. B. Sheldon, and is controlled by a Board of Managers, consisting of five men recommended by the Mayor and approved by the City Council. Thus municipal ownership and operation are moving on.

Syracuse, O., is not the only town in which not a negro is allowed to live. We have heard of such towns in Florida, Texas and Oklahoma. But such tyranny is most detestable and inexcusable in such a State as Ohio. The story we tell in this issue is pitiful and disgraceful.

Dr. Huckel, of Baltimore, pleads for the reunion of the Methodist and Baptist young people with the Christian Endeavor Society. Does he not know that what stands in the way is the interests of publishing societies? It is the love of money, the source of most evils.

Financial

The Growing Crops

A VERY favorable report concerning the growing crops was issued on the 11th by the Department of Agriculture. This was the Department's first statement as to this year's crop of corn. Last year's yield was very large (2,467,480,000 bushels), but there is a prospect now of even a more abundant harvest, the condition of the plants being higher than on the corresponding date in 1904, while the area planted is larger by 2,000,000 acres. The condition of both winter and spring wheat considerably exceeds the average for ten years. Increased crops of oats, rye and barley are indicated by the figures for condition and acreage, but last year's exceptional crop of potatoes will not be equaled. As interpreted by the Statistician of the New York Produce Exchange, the report indicates crop yields as follows, and we add the harvest figures of last year:

	Indicated, 1905.	Harvest, 1904.
Corn	2,651,110,000	2,467,480,934
Winter wheat.....	413,150,000	332,935,436
Spring wheat.....	292,376,000	219,464,171
Wheat, total.....	705,526,000	552,399,517
Oats	949,698,000	894,595,552
Rye	30,676,000	27,234,565
Barley	141,262,000	139,748,958
Potatoes	318,581,000	332,830,300

A Year's Agricultural Exports

OUR exports of cotton during the fiscal year which ended on the 30th ult. had never been exceeded in quantity or in value. There were 8,333,793 bales shipped, valued at \$379,747,454, against 6,004,595 bales, worth \$370,505,583, in 1904, when the price was so much higher. In only two previous years had the value exceeded \$300,000,000. On the other hand, exports of wheat and of wheat flour (in terms of wheat) showed a great decline, being only 43,797,000 bushels, against 120,241,000 in 1904 and an average of 213,000,000 for the six years immediately preceding. This decline is accounted for in part by last year's short crop, but the demand for consumption at home has, of course, been increasing. Corn exports rose from 55,000,000 bushels (in 1904) to 88,500,000, but the average for five

years preceding 1902 was 188,000,000. The value of all our agricultural exports for the year was \$751,755,057, against \$790,211,051 in 1904. In wheat and wheat flour alone there was a loss of nearly \$60,000,000. The net decrease for all breadstuffs, provisions, cattle and hogs was a little less than \$48,000,000.

THE Lawyers' Title Insurance and Trust Company, of which Edwin W. Coggeshall is president and general manager, announce that their sales of mortgages for the six months ending June 30 have aggregated \$35,938,000, which is in excess of the sales for the entire year 1904. The surplus of the company amounts to \$5,000,000; the undivided profits are \$869,700, and the total assets \$25,420,133.

....The Franklin Society for Home Building and Savings, of this city, announces its thirty-third consecutive semi-annual dividend, at the rate of 5 per cent. per annum, to more than three thousand share holders. The Society's investments, which are exclusively in first mortgages upon small homes, are especially exempted from the operation of the Mortgage Tax Law. Its officers report that the demand for its funds from responsible home-seekers is far in excess of its resources.

....Dividends announced:

Phenix Ins. Co., Brooklyn, 5 per cent., payable on demand.

United Copper Co., Common, $\frac{1}{2}$ of 1 per cent. and extra $\frac{1}{2}$ of 1 per cent., payable July 31st.

Louisville & Nashville R'way, 3 per cent., payable August 10th.

Greene Consol. Gold Co., 2 per cent., payable July 15th.

N. Y., Ont & West. R.R., Common, $1\frac{1}{2}$ per cent., payable July 21st.

THE HOME INSURANCE COMPANY, NEW YORK.

The Home Insurance Company, of which Elbridge G. Snow is President, has just issued its one hundred and fourth semi-annual statement. This statement shows that on the first of July, 1905, the total assets were \$19,961,447, being a gain of more than two and one-half million dollars during the past year. The reserves for premiums, losses, reinsurance and all other contingencies amount to \$9,254,470. The capital stock is \$3,000,000, leaving a surplus as regards policyholders of \$10,706,976, an increase since July, 1904, of \$689,169.

NEW YORK, THURSDAY, JULY 27, 1905

No. 2956

Survey of the World

National Topics

The President has decided to issue a call for an extra session of Congress beginning on November 11th. It is understood that he will ask for legislation concerning the Panama Canal as well as for action upon the railway rate question. After a conference between the President and Secretary Root last week it was announced that the administration of Canal affairs would remain for the present under the supervision of the War Department. On the 19th Mr. Root took the oath of office as Secretary of State.—Owing in part to the recent disclosures about the sale of the cotton reports, John Hyde, Chief Statistician of the Department of Agriculture, has resigned. The office has been abolished. Mr. Hyde says in a long letter that for four years he has been constantly under fire from one side of the market or the other, that his administration has been investigated five times and that he has always been vindicated. But physicians tell him that the attacks upon him have shortened his life. As "a powerful combination" is now bent upon causing his retirement, he does not think the office worth fighting for. It does not appear that he had any knowledge of the sale of the reports. These will be prepared hereafter by a board of officers under the direction of Assistant Secretary Hays. It is admitted that recent charges concerning the June tobacco report were well founded. The explanation is made that clerical errors caused the announcement of a large increase of acreage. Complainants say that the errors were in favor of the Trust and against producers.—It is reported that the investigation of the Government Printing Office, now in progress, will be followed by the appoint-

ment of a new Public Printer to succeed Mr. Palmer.—The trial of Congressman Williamson and his partner, in Oregon, for obtaining public land by fraud, resulted in a disagreement of the jury. The final vote was 10 to 2 for conviction.—Dispatches from Washington to Kansas newspapers predict that Senator Burton will not be tried again, altho it has been expected that his second trial would take place in September.—John McMackin, until recently Labor Commissioner for the State of New York, has been appointed United States Consul at Georgetown, British Guiana. The reappointment of Mr. McMackin as Labor Commissioner was prevented by the protests of the Child Labor Committee and other philanthropic organizations, which asserted that he had neglected to enforce the laws.

Mr. Root's Advice to Mayor Weaver

After Mr. Bell, the District Attorney of Philadelphia, had refused either to ask the grand jury for the indictment of the leaders of the municipal ring or to take steps for the arrest of them, Mayor Weaver sought the advice of Elihu Root, and the situation was considered at a conference in which Judge Gordon and Wayne MacVeagh took part. Having reviewed the evidence, Mr. Root, on the 17th, sent to the Mayor a letter setting forth his opinion as to the Mayor's duty "in regard to further criminal prosecution for the frauds clearly indicated by the testimony already taken and by the further evidence which your counsel have collected." Altho "the evidence of grave crimes by a number of powerful and important persons," he went on to say, had been

laid before Mr. Bell, the latter had declined to "proceed with proper prosecutions for such crimes either before the grand jury or before a committing magistrate," and had suggested that the Mayor himself should "proceed before a magistrate as a private prosecutor:"

"It is your duty as Mayor of the city to see that the laws are enforced, and when you find that they are set at naught by criminal combinations, it is your duty to bring the facts to the knowledge of the officer who is elected by the people to prosecute crime, and it then becomes his duty to prosecute, and not yours."

The Mayor had done what the law required, he continued, and he could not justly be blamed if the prosecutions "so clearly indicated by the evidence in the possession of the prosecuting officer should fail for want of further action." He showed, however, that while the law did not require the Mayor to prosecute, it permitted him to do so, up to a certain point. It was his opinion that now it was the Mayor's duty to go before a magistrate and carry these prosecutions as far as the law would permit him to go, inviting the co-operation of Mr. Bell and giving him "every possible opportunity to perform the duty for which he was elected:"

"Crimes committed by men who have political power are often sheltered behind official indifference and inactivity, and then some one has to do more than his duty to secure justice; and you will not be the first public officer who has done a great public service against the resistance of those from whom the service ought to come. There is more at stake here than the mere punishment of isolated offenses. There is the question whether your city shall continue to be governed by criminals or shall take its place on the list of American cities capable of honest self-government. To secure the right solution of this question you cannot omit any proper and lawful efforts."

If the prosecutions should fail after coming within the exclusive power of Mr. Bell—having been carried through the first stage with or without his aid—then the responsibility for failure could be easily placed. Mr. Root expressed regret that he was unable to proceed further with the Mayor in these cases, owing to his new official duties:

"I have taken very great interest in the cases, because I have acquired absolute con-

fidence in the sincerity of your purpose and in your pluck and persistency; and I have a strong desire that the city of Philadelphia, whose history and good name are so dear to every American, shall be relieved from the stain which a corrupt and criminal combination, masquerading under the name of Republicans, has put upon her."

On the same day, one of Mr. Bell's legs was broken by the fall of an elevator in the building where his office is situated. Therefore it was decided that the arrest of Boss Durham, State Senator McNichol and others should be delayed for a time. Mr. Root's letter is regarded in Philadelphia as having much weight and significance in a political sense, owing to his prominence in the Cabinet and as a Republican. The press points out that it must indicate the attitude of the Administration, especially toward Senator Penrose, who from the beginning of the revolt has been associated intimately with the ring leaders whom Mayor Weaver is advised to prosecute. We showed last week the admitted relation of District Attorney Bell, as counsel, to these men. The city newspapers have since published evidence as to the large interest of his relatives in the lands whose value was affected by the ring's Torresdale Boulevard. Among the election officers arrested last week for fraud was a ward politician who held office as inspector of elevators. It appears to have been owing to the inefficiency of this officer or of other similar inspectors that the District Attorney's leg was broken.

Terrible Explosion on a Naval Vessel A shocking accident occurred last Friday on the United States gunboat "Bennington," which was lying in the harbor of San Diego, Cal., having recently arrived from the Hawaiian Islands. Two of the gunboat's main boilers burst and more than 60 men were killed. It was a little after ten o'clock in the morning. All hands were at their stations, and steam was up, for the gunboat was about to leave port. The bay was dotted with pleasure craft and ferry boats. Thousands were looking at the "Bennington." They saw a cloud of steam suddenly issuing from the ship at a point just forward of the smokestack. Then there was the roar of a

great explosion and bodies of men were thrown upward through the steam cloud, some of them rising to the height of a hundred feet. On the shattered deck were dead men and in the water were other victims, some of them struggling for life. These were picked up by the small craft. The gunboat was quickly beached. Water was pouring in through a great hole in her side. At last reports it was known that 60 men had been killed, but 17 of the crew were still missing, and it was foreseen that several of the 55 wounded could not recover. The only officer killed was Ensign N. K. Perry, who, as officer of the deck, had been standing directly over the boilers. Commander Lucien Young, the commanding officer, was on shore at the time. His report says that the top of the lower furnace of one of the boilers exploded, causing the explosion of another, and that the gunboat is almost a total wreck. The first of these boilers had shown signs of weakness during the voyage from Honolulu, and for this reason the pressure upon it had been reduced. Some of the injured men say there had been talk for six months that one of the boilers was defective. They were of an old type and had been in use for fifteen years. Probably they were not in good order. They were under a pressure of only 120 pounds. Just before the explosion one was found to be leaking, and a boiler-maker was on his way to make repairs. The "Bennington" was one of the first vessels of the new navy. She was launched in 1890, was 230 feet long and drew 14 feet of water. Her cost was \$490,000. For ten years she had been in the Pacific squadron and she was with Dewey at Manila.

Railway Rebate Cases In addition to the legal proceedings against the Atchison, Topeka & Santa Fé railroad company with respect to the coal rebates mentioned in the correspondence published when Mr. Morton retired from the Cabinet, Assistant Attorney-General Purdy will take action against the eight railroad companies enjoined by Judge Phillips, asking that they be required to show cause why they should not be punished for

contempt for continuing to grant rebates to the International Harvester Company. This company owns terminals or switching tracks and has obtained rebates by means of a division of freight charges, or a large allowance for its two or three miles of track—from \$12 to \$21 per car-load for service for which, the Interstate Commerce Commission said, a fair price would not exceed \$3½. It was said some time ago that the company and the roads had obeyed the Commission and reduced the allowance to \$3½; but it is now asserted that the division alleged to be unlawful has been continued. Similar action will be taken, it is reported, against the Steel Corporation and certain railroads on account of an allowance or division of the same kind, which is in effect the payment of a rebate.—Mr. Morton, now Chairman of the Board of the Equitable Life Assurance Society, has removed the Comptroller of that Society, Mr. Jordan, for refusing to give him information concerning the work of his office, and has induced W. A. Day, an Assistant Attorney-General, to take, at a large salary, the place thus vacated. Mr. Day has for three or four years been engaged in the proceedings of the Department of Justice against the railroads, the Beef Trust, etc., and has recently had charge of the prosecution of violations of the law against rebates and the like. Owing to his familiarity with the cases and his long connection with them, the prosecution may be delayed, it is said, by his withdrawal from the Government service. Dispatches from Washington say that since January, 1904, the case concerning rebates paid by the Atchison road to Mr. Morton's brothers in the salt business (which was referred to the Department by the Commission) has been in his hands. His departure to take office under Mr. Morton, it is asserted, will tend to delay action in this case, which resembles the one against the Harvester Trust.—Having completed its pipe line to Whiting, Ind., the Standard Oil Company has resumed the purchase of oil of all grades in the Kansas field, where, owing to a recent decision of the courts, the State is restrained from erecting the refinery for which an appropriation was made by the

Legislature.—In a public address at Boston, on the 22d, Attorney-General Moody (with the approval of the President, as he said) reviewed the history of the Government's proceedings against the Beef Trust, and declared it to be his hope and belief that the indictments recently returned, for unlawful combination and for the taking of rebates, would be brought to trial this year. The public should suspend judgment, he added, because the accused had not yet been heard.

End of the Chicago Strike

By the action of the labor unions involved, the teamsters' strike in Chicago was ended on the 21st, and the strikers were directed to seek employment in their old places. This was a complete victory for the employers. It is said that not more than half of the strikers will be taken back. Not one of them will be re-employed by the express companies, with whom the strikers had contracts. Wages will be the same as before, but the employers will insist upon an "open shop." The strike continued for three months; violence caused the loss of 19 lives and nearly 500 persons were injured. Many indicted men are yet to be tried. One was convicted last week and sent to prison for a year. His offense was the beating of a non-union man, and there were seven union men on the jury that found him guilty.—For some time before the recent annual election of the Chicago Federation of Labor (on the 16th) there had been a factional contest in the organization. Chicago newspapers say that the advocates of violent methods sought to prevent the re-election of President Dold, who represents those who oppose the use of "wrecking crews." At noon on the day of the election the hall, in which there were very few persons, was invaded by a party of "wreckers," who attacked the election judges with revolvers and compelled them to give up the ballots already deposited, which they destroyed. They then beat Michael Donnelly (president of the meat cutters' union, who conducted the beef workers' strike) with a slung shot and other weapons, leaving him for dead on the floor. Donnelly is recovering, but will lose one eye.

Political Quarrels in Cuba

The approaching presidential campaign in Cuba has caused political quarrels of a serious character. José Miguel Gomez, nominated by the fusionists for the presidency, is Governor of Santa Clara province. An examination of the municipal affairs of Vueltas, in that province, was recently ordered by the insular Government—or by President Palma, who will be nominated for another term. Gomez gave orders that the Commission sent by the President should not be permitted to make the examination. The Commission, protected by Rural Guards, was to begin the inquiry on the 22d. But at 5 o'clock on the morning of that day, the Vueltas city hall, with all the municipal records, was destroyed by fire. Upon the charge that this fire was in some way caused by them, the Mayor and Chief of Police have been arrested. It is said that if the Commissioners had sought to obtain possession of the records, they and the Rural Guards would have been attacked by the people of Vueltas. On the day preceding the fire, a resolution censuring the Government for action at Vueltas, as tending unnecessarily to disturb the peace, was passed in the House at Havana. The hostility of the fusionists has also been excited by the recent suspension of the Mayor of Havana, and the following decision of Governor Nunez that the suspension must be permanent.—A strike of stevedores at San Juan, Porto Rico, has been followed by sympathetic strikes of the teamsters, butchers and bakers. The unloading of freight in the harbor has been greatly delayed. Strike-breakers are lodged on steamships at anchor.—In the Philippines, the campaign against ladrones in the provinces of Cavité and Batangas is ended. Troops and the constabulary, working together, captured 511 rifles and killed seven leaders. There were about 700 of the bandits. Half of them are dead, and many of the survivors have been sentenced to long terms of imprisonment.

The Chinese Boycott

The State Department was informed by Consuls on the 19th that the boycott against American goods, organized by

the trade guilds of the ports of Shanghai, Canton, Tien-Tsin, Hankow and Niu-chwang, was in force, altho discouraged by the Chinese Government. At Amoy the native agent of the Standard Oil Company was ordered to leave the service of that corporation. At a mass meeting in Shanghai, attended by heads of all the principal guilds and by delegates from several provinces, on the 20th, it was said that the boycott was not an expression of hostility toward the American Government, but was designed to affect the labor unions of our Pacific Coast. At Shanghai all Chinese shops were refusing to sell American goods, and all schools and colleges in that part of China had decided to use no American books. The movement has been assisted by the circulation of reports that there is poison in American flour. Our Consul at Amoy says that a considerable quantity of flour did contain poison, owing probably to an attempt to smuggle morphia in it. Copies of a boycott circular have been distributed throughout a large part of the country. It contains reports of the meeting of the guilds in May, with an agreement signed by all present. This provides for an investigation as to all imported American goods, and for securing the support of impartial editors in the United States. Workmen and servants are urged to discriminate against Americans in the wages demanded. Natives who persist in selling American goods are to be socially ostracised.

Preparations for the Peace Conference

The Navy General Store, a handsome new brick building in the navy yard at Kittery, Maine, is being fitted up by the United States Government for the use of the peace plenipotentiaries, who are expected to have their first meeting there August 5th. They will be lodged in opposite wings of the Wentworth, and will be conveyed each day across the Piscataqua River in launches or by automobiles through Portsmouth. They will be brought from Oyster Bay to Portsmouth by the Government yachts the "Dolphin" and the "Mayflower." Baron Komura, the Japanese Minister of Foreign Affairs and chief plenipotentiary,

landed at Seattle from the steamship "Minnesota," and came rapidly across the continent to New York City. He was warmly greeted by Japanese residents of Seattle and at many points along the route he was received with cheers. All invitations to formal dinners and social events have been declined. Twenty rooms have been engaged at the Waldorf-Astoria for Baron Komura and his staff. The Russian delegation will stay at the St. Regis. Mr. Witte, the chief Russian plenipotentiary, arrived in Paris from St. Petersburg on July 21st and spent a long time in conferences with President Loubet and Premier Rouvier, supposably discussing peace terms and the changed relations between the allied nations. Before leaving Russia he gave an interview to the Associated Press, in which he expressed the opinion that the peace negotiations would not be prolonged or successful, and stated that he should return immediately if the Japanese proposals were not satisfactory:

"The Emperor is the friend of peace, and desires peace, but I very much fear that the Japanese terms will be such that we will be unable to reach an accord.

"Secondly, the world should disabuse its mind of the idea that Russia wants peace at any price. There are two parties in Russia. One favors the continuance of the war *à outrance*—this is a large and influential party. The other, to which I belong, favors peace. I avow it frankly, because telling the truth has always been my rule in politics. I was for peace before hostilities broke out. When the war began, the situation changed.

"I am sure if I report that the conditions of Japan cannot be accepted Russia will accept the verdict and the Russian people will be ready to continue the war for years if necessary.

"Thirdly, Russia is not crushed, as the foreign press has led the world to believe. The interior situation is very serious, I do not deny; but in Europe and America the true significance of what is happening is not understood.

"Russia is not on the verge of dissolution as a great Power, and is not obliged to accept any conditions offered, in spite of the military reverses she has sustained.

"We are passing through an internal crisis which has been marked by many grave events, and which may have others still in store, but the crisis will pass, and in a few years Russia will again take her place as a preponderant Power in the European concert."

On the other hand, Baron Hayashi, the Japanese Minister in London, on being told that it was expected that the terms offered by Japan would be moderate, replied: "I cannot see where people get such an idea. The public evidently mistakes the Japanese for angels."

**Balfour
Defeated**

The bill for the redistribution of seats which would cut down the Irish representation by 24, and add 17 to the English, four to the Scotch and one to the Welsh, was withdrawn by Premier Balfour, who stated that there was not time enough to give to it at the present session, but that it would be brought up at the next session after certain details had been more fully worked out. The Alien bill imposing restrictions on immigration similar to those of our country was passed by its third reading in the House of Commons by a majority of 90. On the night of July 20th the Liberals and Irish members took advantage of the absence of a number of supporters of the Government to defeat the Government by a majority of three on a motion to reduce the membership of the Irish Land Commission. There was great excitement; the Irish members yelled "Resign!" and the Liberal leader, Sir Henry Campbell-Bannerman, demanded that the Government take immediate action. On the following day Premier Balfour had consultations with the King and with the Cabinet, and it was decided that the Government would not resign so long as it could obtain a majority. It is contended by the Conservatives that it would be very dangerous to change the administration just now when the peace negotiations place the Anglo-Japanese alliance in such a critical state. The bill providing for the settlement of the difficulty between the Scottish United Free Church and the Free Church passed the House of Commons.

**Czar and
Kaiser**

Emperor

The Kaiser's yacht again surprises the world by steaming into troubled waters. The William of Germany tele-

graphed the Emperor Nicholas of Russia that he wanted a personal interview with him. In accordance with this request the Russian Emperor left Peterhof suddenly and almost secretly on board the imperial yacht the "Polar Star" to meet the "Hohenzollern" in Swedish waters off the island of Broerkoe. The Grand Duke Michael and a number of Russian naval and army officers and courtiers accompanied the Czar, but no representative of the Russian Foreign Office. Whether the conference of the two Emperors deals with the conditions of peace, the Morocco situation or the Scandinavian question is purely a matter of speculation.—An attempt was made to assassinate Constantine Pobiedonostseff, Procurator-General of the Holy Synod, July 20th, in the railroad station of Tsarkoe-Selo. The assailant passed close in front of him and drew a revolver, but was seized by another passenger in the train. The aged and infirm Procurator was not perturbed by the attack, but drove to the Holy Synod and presided over a session without mentioning the matter to his colleagues. He afterward gave his views of the occurrence and of the present crisis in the following language:

"The causes for the attacks on me lie in ignorance and dishonesty—ignorance of the fact that for ten years I have had no influence in legislation, and dishonesty of the most dastardly sort because of unpopular measures and policies with which I had absolutely nothing to do being intentionally credited to me. The attacks are also due to unprincipled and irresponsible Russian papers printed abroad, which ignorantly fire the imagination and inspired the attempt on me last year.

"There is no doubt that only such reforms and institutions will take root as have foundations of a national character. Only a nation capable of local self-government can work out and preserve free institutions and guarantee civil freedom. Otherwise a new Government would be bound to produce as unsatisfactory bureaucrats as those whom it seeks to replace. The present reform movement has on its banner the familiar falsehoods, 'Universal Suffrage' and 'The Will of the People.'

"It is no secret that freedom and national government are mere theories to our reformers—not sufficiently studied and not at all understood. It takes men to create institutions. The men in demand here must come. They are not yet in sight."

The Zemstvo Congress

The Congress of representatives of the zemstvos and dumas, the provincial and municipal legislative municipal bodies, met in Moscow, July 19th, at the palace of Prince Paul Dolgorukov, Marshal of the Moscow nobility and son of the Grand Chamberlain of the imperial court. There were 284 delegates and many other leaders in the reform movement. Soon after the meeting opened the Chief of Police appeared with a posse of officers, and, acting under the orders of General Trepov, whom the Czar has placed at the head of the police system of the empire, notified them that the meeting was forbidden on the ground that it was calculated to promote disorder. This announcement was greeted with laughter and jibes. The president, Count Heyden, informed him that the Czar had on June 19th authorized the meeting. The Chief of Police then said he would seize the papers and take the names of the delegates, whereupon copies of the proposed constitution under discussion were given to him and each delegate handed him his visiting card. Many of those present who were not delegates insisted upon their names being included. After completing their official report many of the police returned and listened to the debates. The plan of Minister of the Interior Bulygin for a National Assembly based upon the principles of representation by classes and strict property qualifications was denounced as unsatisfactory and insufficient, but it was not considered wise for the zemstvoists to refuse to have anything to do with such an assembly, as was at first proposed. It was decided better to secure as many seats as possible in any assembly the Czar may call, and use that as a vantage ground for securing additional reforms. The form of government for Russia approved by the Congress is modeled after that of England and consists of a responsible Cabinet with a Prime Minister appointed by the Czar and a National Assembly of two houses, the lower elected by universal suffrage and the upper by the zemstvos and dumas. Finances, foreign treaties and the succession to the throne are to be in the hands of this assembly. The Czar is to remain Commander-in-Chief of the army and navy, and there is no express re-

striction of his right of veto. In case of a persistent conflict between the two houses as to any bill it will be voted upon in joint session. There are to be no distinctions made between individuals on account of race or religion. The sanctity of the courts is insured, and the Czar is to have no power arbitrarily to dissolve Parliament. The passport system, the scrutiny of correspondence and the censorship of the press are to be abolished. There is to be one representative for about 150,000 of the population. This plan for a constitution was adopted by a vote of 220 to 7, and it was resolved to give it the widest possible publicity for discussion by the zemstvos and dumas and by the people. A resolution was adopted declaring that in view of the arbitrary acts of the administration and the constant violation of the rights of the public the Congress deems it incumbent on all to defend the natural rights of man by peaceable means, including resistance to acts of the authorities violating these rights, even tho such acts be based upon the letter of the law. Mr. Petrunkevich expressed the feeling of the majority in the words: "We counted on reforms from above. We appealed to the Emperor in vain. We now appeal to the people." This was declared to be a direct incitement to revolution by Prince Rostkovsky and he and some of the more moderate members of the Congress withdrew. The Congress will meet again in August, or will be called together by telegraph in case the Bulygin constitution is promulgated by the Czar. It is rumored that if they are pushed to extremities the zemstvoists will proclaim the deposition of the Emperor Nicholas and the establishment of a regency of four Grand Dukes for the infant Czarevitch. The Russian newspapers were forbidden by the censor to make any mention of the Congress, but the *Slovo* published the proceedings in full. For this it was suppressed by the Government and the other papers which published partial accounts were given official warnings. Three such warnings result in suspension of publication. At the next Congress those portions of the empire where there are no zemstvos will be represented. The zemstvoists are preparing an educational campaign among the people, including

the peasants, to organize a great reform party.

An Attempt to Assassinate the Sultan

As the Sultan of Turkey was leaving the mosque at the conclusion of the ceremony of the Selamlık on July 21st a bomb exploded in the courtyard of the mosque, killing 24 persons and wounding 57. The Sultan was on the top step of the flight leading from the mosque about 30 yards from the bomb and was not injured by the explosion. In the words of the official report:

"Divine Providence miraculously preserved His Majesty, who displayed his usual self-possession and courage. Himself driving the phaeton, His Majesty returned to the palace, graciously bowing as if nothing had happened. A few persons were killed or injured. The whole population is indignant at the infamous and dastardly deed."

The bomb exploded in the midst of the waiting carriages, destroying 27 of them and wounding 55 horses. Most of the victims were coachmen and guards, but Beba Bey, tutor to the Sultan's sons, Teherkess Mehmed Pasha, Kenan Pasha and others of the imperial household were killed. The windows of the pavilion reserved for the diplomatic corps, in which were U. Grant Smith, second secretary of the American Legation, and Captain Smiley, of the United States Army, were broken by the force of the explosion. The Sultan has always been afraid of assassination and every precaution is taken to prevent the access of suspicious persons. When going to the mosque troops guard the whole route, so it is a mystery how he would be regicide secured his opportunity. No clew has been found to his identity and it is thought that he perished in the explosion. A mine exploded by clockwork may have been used. The heir apparent to the Turkish throne is Rechad Effendi, brother of the Sultan, now more than 60 years old and said to be dying of cancer. Next in succession is Prince Issedine, eldest son of the late Sultan, Abdul Assiz, who is thought to have been murdered by the present Sultan. The Sultan Abdul Hamid II is now 53 years old and is desirous of being succeeded by his son,

Burhan-Eddine Effendi, a bright young man, well educated and devoted to the Emperor William of Germany.

The Morocco Agreement

The result of the conferences between Prince Radolin, German Ambassador in Paris, and M. Rouvier, Premier and Minister of Foreign Affairs, is that France agrees to the international conference on the Moroccan situation as desired by Germany, and Germany agrees that she

"will pursue at the conference no course compromising the legitimate interests of France in Morocco or contrary to the rights of France resulting from her treaties or arrangements, and in harmony with the following principles: Sovereignty and independence of the Sultan, integrity of his Empire, economic liberty without any inequality, utility of police reforms and financial reforms, the introduction of which would be settled for a short period by international agreement, recognition of the situation created for France in Morocco by the contiguity of a vast extent of territory of Algeria and the Shereefian Empire and by the special relations resulting therefrom between the two adjacent countries, as well as by the special interest for France, due to this fact, that order should reign in the Shereefian Empire."

It is generally admitted that M. Rouvier has extricated France from a difficult and dangerous situation without any serious sacrifice of national honor, since the treaties of last year with England and Spain in regard to Morocco are inferentially sustained and the special interest which France has in Morocco is to a certain extent acknowledged. On the other hand the Kaiser has manifestly scored a distinct diplomatic triumph by compelling the resignation of such a popular and successful Minister of Foreign Affairs as M. Delcassé, and the recognition of her right to interfere in a matter which France regarded as her own affair. The conference will probably be held on Spanish soil, at Madrid or San Sebastian. Both the German and French delegations at the Moroccan capital will be withdrawn pending the conference. There has been severe fighting in the neighborhood of Ujda between the Sultan's troops and the insurgents, in which the latter were defeated.

The Battle of the Sea of Japan

BY TWO PARTICIPATING JAPANESE OFFICERS

[The two following articles are the first, we believe, that have appeared in this country by officers of the Japanese Navy who took part in the destruction of the Russian fleet. They have just come from Japan and are translated and edited by Mr. Adachi Kinnosuké.—EDITOR.]

The Battle of the Sea of Japan

By a Japanese officer aboard Admiral Togo's flagship, the "Mikasa."

I was looking into the southwest. The sky there was quite as uncertain as prophecy; the wind coming out from that direction was rapidly freshening into a gale. It was about four o'clock in the afternoon of the 26th of May, 1905. Through our scouting squadron we were aware of the enemy's movement, and His Majesty's fleet, which was made up of almost every ship of consequence in the Nippon Navy, rode at anchor at the rendezvous. We knew that a great day was about to pass into history and the "Mikasa" once again was to have the distinction of flying upon her halyard the pennant of Admiral Togo. Out of the gray sky gradually the shades of evening fell upon us and it seemed very much as if a storm were to ride the Korean Straits all night long.

A little before the East began to open its eyes on the following day—at about half past five in the morning, to be precise—the "Mikasa" received a wireless message. It said: "Hostile ships are sighted." Brief, and indeed that was a message we had expected every moment. All the same, I doubt if the message of the sudden death of my mother falling out of the sky could cause so great an emotional storm as I felt at this announcement from our scout.

And the "Mikasa" unfurled the battle flag. At the same time she signaled to the vessels of the fleet: "Wagakuni no som mo kono ikkyo ni ari; sho shi sore doryuku seyo!" (The existence or death of our country hangs upon this action; both officers and men, do your utmost!)

We were busy for about one hour following the signal. Our ships were about to start upon their red bridal; we were

about to play a game with no less a stake than the life of the lands of the gods and the honor of the Hinomaru flag. Although we had spent many months in preparation for the day which seemed to be upon us at last, we wished to add a few finishing touches. About half past six, standing out to sea a little over five knots, the "Mikasa" signaled to the rest of the fleet, "Steam forth at half speed." The "Shikishima" led the principal squadron, the "Fuji," the "Asahi," the "Nisshin" and the "Kasuga" following in the order mentioned. Heeling the main squadron, the "Izumo" led the second squadron, with the pennant of Vice-Admiral Kamamura floating upon her. The fourth squadron followed, with the "Naniwa" at the head. Both the destroyer and torpedo boat flotillas accompanied us. Another message came to us from our scouting squadron; it read: "It seems that the enemy is making for the east channel." It was about nine o'clock; the "Mikasa" had joined the fleet and was leading the first squadron.

The day was clearing but foggy, and the wind was stronger than ever, and more than once the waves washed the foredeck of the "Mikasa." From portholes also water and spray dashed in. At times so great was the inrush of the sea that in a certain section of the ship there was more than a foot of water, through which men had to wade with shells before they could feed the guns. One sailor stumbled and fell in the water.

"Are you hurt—seriously?" asked a lieutenant.

"The shell is dry, sir," was the answer of the sailor.

And this aboard the "Mikasa," which is, as you know, a ship of fifteen thousand tons. Far astern the cruiser squadron we saw from where we stood tor-

pedo boat flotillas. One can imagine their plight. To us they appeared like a string of autumnal leaves flirting with something which seemed to be much more dangerous than fire—the anger of the sea.

“Only the mad would venture upon this sea on a torpedo boat,” I heard one of my comrades say.

“We are capable of a greater madness even than that,” some one retorted. “That is to say, under some circumstances—when the life and honor of the imperial land call us out to sea, for example.”

We had no prophets aboard the “Mikasa,” and none of us knew what fate had in store for us on that her own parade day. We had with us a worker of miracles called Admiral Togo. And that made most of us quite content. We knew that only a rather unexpected good humor on the part of luck would afford us time for lunch, and in the service of His Majesty’s navy we were expected to learn a few things besides putting our entire trust on that happy god called chance. So it came to pass that we found an unusual plenty of rice in our morning meal.

All was ready; the men were at their stations; to them only a signal was wanting. We steamed leisurely in the direction of Okinoshima. Meanwhile permission was given to men to take their rest after their own fashion—at their posts. And I look upon this rest as one of the most effective preparations made for the battle. In my round of inspection I had the pleasure of seeing those men—they had worked hard since five that morning—taking their ease according to their sweet pleasure. At every gun a few shells were gathered ready for an immediate call. And a number of our good sailors mistook the shells for pillows. The sight might have scandalized the arms factories all over the world, and if they could only listen to the “music of sleep” upon those shells, they would have been overwhelmed with compliments on their success in making soft pillows. As for me, who was not a manufacturer of ammunitions, the high snoring of our men had another message. In their sleep, profound as that of babes, I thought I heard a prophecy that was

quite pleasing to us. Moving about amid the all-absorbing rest of our men, I felt sure that the day was to be ours. At any rate you know, quite as well as I, that nothing could have told the tale of the iron nerve of those men better than their childlike sleep within the hour or two of what they all knew to be the greatest naval battle since the birth of sober-minded history, and upon which hung the destiny of their beloved land.

We steered east-southeast, then shifted to southwest. The fog began to kidnap the horizon. Very soon the Tsushima rose before us in her robe of silken fog, looking for all the world like a vision of the blessed Arabian memory.

All this while our scouting squadron had kept in touch with the enemy, steaming, in fact, almost parallel to their course and always out of range of their guns and always trying their prettiest to keep out of their vision as well. And on the “Mikasa” we received from time to time messages of the enemy’s approach through the wireless telegraphy. The enemy could have disturbed and interrupted our communications, but they seemed quite indifferent. They must have despised our strength at the Tsushima Straits heartily, for on that ground alone can one explain their carelessness in this respect, as in many others. Steadily they came, and it is impossible to restrain our admiration for this desperate courage of the Russian, for this lordly arrogance which seemed to say to us, “After all, you are Asiatics, are you not?” It was about one in the afternoon that we were thrilled at the first sight of our long-expected guest. There was about thirteen or fourteen thousand meters between us, and the hostile ships penciled their silhouettes against the dream-like curtain of fogs like the skeletons of phantom ships. I made out four battleships and in addition to them cruisers, coast defense ships, to the number of twelve, and there seemed to be a number of other ships—lighter cruisers and transports, perhaps—trailing to the rear. They seemed to be heading northeast in double column line ahead, and steaming at the speed of about twelve knots. At the first sight of our main squadrons the enemy seemed to falter a little. Soon, however, I saw them head boldly toward

us. Now we were already within ten knots of the Russians. We saw Okino-shima to southeast; we were about to enter into the effective range of fire. The wind, which was blowing fiercely out of the southwest, smote us full in the face, and naturally the same wind gave wings to the Russians, who were coming from almost opposite direction. Not wishing that the Russians have all the natural advantages on their side on the ground of our own choice, we ported the helm sharply. We were now steaming almost due west and our course made an acute angle with that of our enemy; steadily, without saying a single word, with the even tread which cowards do not know in the hour of battle, we closed in. It was at this time that I noticed from the "Mikasa," a change in the formation of the hostile ships. Their cruiser squadrons, which had been steaming to the port of the Russian battleship squadron as if to shield the heavier ships from our fire, standing as they did between our fleet and their own battleships, began now to drop to the rear and take their stations in a formation which was line ahead. And to the starboard shelter of this line of battle the Russian admiral wisely placed the still lighter ships of war and transports.

We saw with no small delight that we commanded a decided advantage in speed, just as we had expected. We could therefore determine at what point we should fight and in what manner. At high speed the flagship led the fleet across the path of the Russians. And the two contending fleets described the letter T with a curved roof.

It was about five minutes after two and the distance between the fleets was about thirteen or fourteen thousand meters. I saw a dainty ball of cotton belch from the barbette of the flagship of the enemy. Like the Chinese in the Battle of the Yellow Sea of ten years ago, the Russians opened the "ball." We did not reply. The Russian shells fell far short. Always the "Mikasa" led the fleet athwart the path of the Russians. Our gunners were ready; it is not strictly correct to say that they were impatient. They knew that their officers knew better than they the time when to fire. Moreover, there were before the

eyes of all of us objects which were very interesting and which had been carrying all the eyes of the world now for many months, and had brought and centered them to the Korean Straits over half the world. None might gainsay the splendor of that stately array of the Russians. Looking upon them, I for one could see very well how it was that Russia dreamed of a day when through them she should once again be the mistress of the Far Eastern waters.

Then the fitting word was spoken; our gunners received the order.

In an instant a thousand thunders fell upon the pallor of the sea.

Our superior speed carried us across the front of the advancing Russian line of battle, and as we steamed we concentrated our fire upon the Russian leader. As soon as we found ourselves across the front of the Russians and over to the starboard of the hostile line the "Mikasa" signaled to form the line in reverse order, and every ship turned sharply to port through 180 degrees, and so completely reversing the order of ships and the direction of the fleet. This brought the guns of our larboard broadside to the enemy. It was not altogether an unkindly turn, this maneuver. To our gunners in the starboard quarters who had kept open the floodgate of hell upon the devoted and heroic head of the Russians for some time it brought a few moments of grateful rest. And once again we rode back the way we came, across the path of Russian progress. The movement was repeated a number of times. At one time something made me turn my eyes to the ships of our fleet. They were keeping the stations beautifully. With their trains of smoke trailing far to the lee, curling here and there, and describing without a shadow of effort a thousand curves of grace and then finally vanishing away, they composed a picture at which I could not suppress the heavings of my breast. I could not see how on earth the Russians could find it in their hearts to deny them the merited title of the Mistress of the Three Seas.

By three o'clock in the afternoon the battle was waxing to its climax; our steel seed which we had sown with lavish generosity began to bring forth the fruits.

It was just about this time that two squadrons of our fleet detached themselves from the main line and disappeared in the fog which was closing in. They were not lost from view very long. When they reappeared they were upon the rear of the hostile ships. The enemy was bagged—bagged as a helpless rat in a trap. And looking back—for although I have little of foresight, I am always proud of my hindsight—I am inclined to think that fate, whom some of us in our black moments mistake for a football, and who is unquestionably wise, began to strike the hour which was to settle many things, among others the future of Asia, the doom of Russia's sea power upon the Pacific and a new day for the peace of the Far East. The confusion among the Russian ships increased; so also the rigor of the savage fire we maintained upon them. After three hours of fighting—that is to say, a little past five o'clock in the evening—I saw a Russian ship with one smokestack lose the freedom of motion and stagger drunkenly to the rear. She was vomiting a huge column of white smoke, evidently disabled. The constant pressure upon the head of the Russian line was telling upon the hostile ships and the enemy changed their course, heading west, leaving the unhappy ship to the mercy of our concentrated fire.

One of the heavy shots struck her mast, and you will be surprised how light a heavy military mast is sometimes. Like a feather in a storm it flew into the sea. Soon the fire mantled her completely; the sounds of many explosions reached us even above the din of our own guns. Gradually and finally wrapt in her funeral sheet of smoke and fire, the hapless ship began to list. The first victim of the battle. And it was the pitiful sight of her that brought the shout of *Banzai* which broke the human silence aboard the "Mikasa." We left the duty of *coup de grace* to the "Chitose" and destroyers. About thirty minutes after that we saw the ship disappear with one final explosion. Even as the sea which floats the cross of St. George and the Sun-round flag with equal amiableness was adding another skeleton in her closet we saw drop to the rear two other Russian ships, both in a sad plight. And they found

themselves within two thousand meters of the "Mikasa" as we steamed away from the last victim. And the prompt manner in which the heavy guns of our battleship squadron turned their fire upon the two ships made you think of a snow covered plain of the north and a pack of wolves on a horse which had lost his way. I noticed especially the fearful work which our twelve-inch guns and the ten-inch shells from the "Nisshin" wrought upon the two Russians. Within less than ten minutes one of them was on fire, fore and aft. Without even so much as a groan she took all we could give her, but not for very long. Like a man shot through the heart, I saw her pitch forward and dive rapidly, bow first. Very soon her stern was high out in the air. I shall never forget the ghastly pose it struck against the gray of the fog and the white of the angry sea, with her propeller marking a sort of funeral cross. Turning almost completely over, she went down.

Once more we headed off the main squadron of Russia and once again we centered our fire upon the "Kniaz Suvaroff." Fire broke out upon her; white columns of smoke towered into the sky and I saw vivid tongues of fire stalking upon her upper decks. From the way her guns were served, and judging from the courage with which she fought, you would have said that the hail of shots in which she was wrapped and all the fires caused thereby were too trifling an incident for the Russians to call for serious attention. If it were the courage of desperation, theirs was certainly splendid. The "Kniaz Suvaroff" and her comrades seemed to have centered their fire on the second ships in our squadrons even more than upon the flagships themselves. Not only with our first squadron, but the same was the case with the second squadron. It may be that the enemy thought the admirals were aboard the second ship in each squadron instead of upon the ships which carried their flags. The "Azuma" suffered a good deal from the concentration of hostile shots; she was second in our armored cruiser squadron. One of the shots struck one of her guns and destroyed it completely. Another struck the casemate of a gun which was placed below

her aft conning tower. The shell pierced it and on entering it exploded. The excessive violence of the explosion dismounted a twelve-pounder which was on the deck above and wounded Commander Togo, who at the time was in the conning tower.

All through the action the fog prevented our seeing even with the assistance of a binocular a distance of more than six knots. In outmaneuvering the enemy we steamed out of their sight often. Five times we disappeared from the enemy's sight and five times we returned into the effective range of fire. And each time we met we spent about thirty minutes in the actual exchange of fire. From a little after two, when the Russians wasted a couple of trial shots, to about seven, which saw the conclusion of the fleet action of the day, there were three solid hours of fighting.

At about six o'clock, when the dusk was beginning to fall, we noticed a singular behavior on the part of the Russians. To our eyes they seemed to disperse. In their apparent disorder they had, nevertheless, one thing common to them all: All were trying to head northward. As we had done before, the main strength of our fleet threw itself across their path and brought the guns to bear upon the head of the Russian line.

It was about 6.50 p. m. that a heavy shell shattered the main mast of the "Borodino." She was on fire. Like a strong man whom you see in tears, the last hour of a battleship touches you to the heart. Ten minutes later she turned turtle. Seven strokes from a clock tolled her knell; lying on her side she went down. And the night, which had covered many a historic wreck of human strife, rung down the curtain once more upon the blood and fire of this perhaps the greatest naval action in history.

Our principal squadrons drew away to the north; it was the hour for the torpedo boats. It was about 7.20 that I saw through the twilight, which was darkening over the sea more and more, the flotillas steaming away from the protection of our heavier vessels, headed for the profiles of the Russian ships melting away into the night. The Russians were expecting them, and a sudden deluge of shots spoke their greet-

ing to the frail craft, which seemed to live on that sea through a miracle. We covered the reckless advance of the torpedo flotillas with a steady fire, and so the belligerent fleets passed into the darkness. At about eight o'clock we began to hear the tunes of the torpedoes which had gone home. A little later, out of the night and from the direction in which our torpedo flotillas had disappeared, a strange sound reached us. It was weird in the extreme; shrieks of human voices they undoubtedly were; nevertheless the distance had mellowed the sharper notes and translated them into a ghostly melody. You would have said that the restless and unhappy souls, escaped from the nirvana, storm tossed and heartbroken, with the black memories of the sins of yore, were calling out of an angry sea for a honey drop or two of sympathy from their brothers in the flesh. There seemed to us more than six hundred voices in the chorus. It was impossible to tell whether the shrieks were from our men or from the throats of the drowning enemies—perhaps both.

We shaped our course to the northwest; we were certain that the Russians would make for Vladivostok. With the exception of the ships detailed on special duties we made for the rendezvous north of the Liancourt Rocks. The communications among the vessels of the fleet were maintained throughout the night—not without difficulty, however. The Russians, so indifferent at first about the communications among the vessels of our fleet through wireless telegraphy, were now very active in disturbing it. A little before the break of day, on the 28th of May, we received a message from our scout; it confirmed our belief and read: "The remnant of the hostile fleet is making for Vladivostok."

About twelve miles to the east of Takebe Bay, a little before ten o'clock in the morning, we sighted five ships of the enemy—the "Orel," the "Emperor Nicholas I.," the "Admiral Seniavin" and the "General Admiral Apraxine" and a cruiser. And the cruiser was the "Izumrud," as we came to find out later. Almost as soon as we hove into view she detached herself from the squadron and, shaping her course straight for Vladivostok, steamed away at full

speed. We opened fire upon the four Russians; at first they showed a half hearted sign of resistance. Presently their fire ceased. There was something abrupt and sudden in this silence of the hostile guns. Outwardly they did not seem as if their fighting power were gone. Naturally our glasses wandered over them in search after the reason. They rested for a moment upon the halyard of the "Orel."

Above the cross of St. George another color was flying.

It was the Sun-flag of Nippon.

The Capture of Vice-Admiral Rojestvensky

By a Japanese Officer Aboard the "Sasanami."

In the night of the 27th of May, three Nippon destroyers found themselves together, the "Sasanami," the "Usukumo" and the "Kasumi." The hour was far gone; the sea was black, smothered with fog, stormy. All of a sudden we bumped literally into a line of Russian cruisers. Upon the "Sasanami" we felt that the last hour for the ship and the men was upon us. The Russians must have discovered us at about the same time as we saw them, and they opened fire all the more terrific because the stormy night and the short distance emphasized the savageness of it all. The "Kasumi," which was leading, ported the helm sharply and raced across the line of the Russian advance and both the "Sasanami" and "Usukumo" were forced to steam through the hostile line and escape to the rear of the cruisers. As we succeeded in steaming out of the danger zone we felt as a man who had just walked through a dream and a miracle. We were safe and sound—without a scratch. Doubtless the reason was because we were too close for the enemy's guns to do us harm. Soon after that, in the dense darkness of the night, the "Sasanami" lost the company of her sisters.

On the morning of the following day, the 28th of May, at about ten o'clock, we saw from the "Sasanami" two columns of smoke floating above the horizon. Whether they were friends or foe we had not the slightest clue to determine. We were sent to hunt for the remnants of the Russian fleet and if possible to destroy or capture the vessels which had

been crippled in the action of the 27th. We were therefore tempted to find out a little more of those telltale columns of smoke. At thirty knots an hour we steamed straight in the direction of the strangers. As we approached, two pairs of masts began to emerge above the horizon, supporting the two leisurely plumes of smoke. Very soon, through the glasses, we saw that they were two destroyers. They were flying the Russian flag. We were now within range of guns and we lost no time in opening fire upon them. Almost with the first flash from our guns one of the Russian destroyers cut and ran. The other, however, to all appearances, looked as if nothing was happening; she stood still, hardly less indifferent than one of the stray rocks in the Sea of Nippon. Moreover, we noted that she did not return our fire. For a moment therefore we suspended our fire and searched her with our glasses. Atop of her foremast a white flag was waving and instead of the cross of St. George the red cross flag was floating from her stern halyard. The "Sasanami" signaled her to explain herself. The Russian signaled back: "Our engine is damaged; coal has given out and we are in need of water," and the signal went on to say that there were two admirals aboard her. There was no frantic shouts of the *banzai* at this unexpected news aboard the "Sasanami" and the chief reason of our soberness was unquestionably because the news seemed to us altogether too good to be true. Moreover, did not we hear so much of the cleverness of the Russian at a ruse? It is a simple paragraph of history, however, that we did not lose a single moment to board the Russian destroyer. The officers of the boarding party carried the Nippon swords and the men were armed with pistols. And we were quite ready for whatever might happen. The destroyer was the "Biedovy"; she had a complement of eighty men and officers aboard her. Besides them we found aboard her Vice-Admiral Rojestvensky, the head of his staff and eight other officers under them. The day before, it seems, the flagship of the Russian admiral had been sunk and the admiral, severely wounded, had been transferred with some of his staff officers to the "Bie-

dovy" upon which, as the strange entangling of human paths would have it, we fell so unwittingly. The capture of the commanding admiral of the Russian fleet is certainly the climax, and a rather dramatic one too, of the Battle of the Sea of Nippon—that at least is what you would be likely to say and the rest of the world with you. All the same we were not in the least happy over the capture of the hapless admiral. Neither would you have been had you seen his sad condition—bleeding there, in the narrow room of the destroyer. To us the surgical attention tendered him seemed decidedly inadequate. What an ending of that famous trip of his and his fleet over half the globe! One thing touched us all more than I could tell you. It was the respectful attitude of the officers and men under him toward their commander. And both officers and men of the "Biedovy" begged us to leave their admiral at peace there where he lay. We could not find it in our hearts to refuse this request, and as a matter of fact we did not insist on removing the admiral to our ship. We escorted only nine officers of the "Biedovy" to the "Sasanami" and through them we accepted the surrender of their destroyer. All this took a great deal of time—the detail of the surrender and the examination aboard the Russian ship and so on, and already the night was upon us. The "Biedovy" was disabled; it was necessary to tow her. We made in the direction of the Liancourt Rocks; we could only make ten knots. The night was black and none of us could tell when we might come, as indeed we did in the night before, upon the remnant of the Russian fleet, against whom we would not like to pitch our frail strength. Ah, well, said we to ourselves, when it comes to that there is only one thing for us—we shall find a common grave, both the Russians and ourselves, in the knightly Sea of Nippon. We were sure that on our journey through the shadow world we would not be without companions. It was a heavy load for the "Sasanami." Knowing how quickly she can race when she is herself, she was impatient, creaked, groaned and swayed. Not so long after

we started on perhaps the most historic journey that will likely be given in the life of the "Sasanami." There was a sharp sound of something snapping. Our ship shot ahead like a bird out of a cage. It was the tow-rope that broke. Whether it were our impatience which lengthened the time I do not know. It seemed an eternity before we could get under way. And the rough sea which washed our deck all the while added not a little to our embarrassment. After having fastened the "Biedovy" on that dark night we are fairly qualified to attempt the work of threading a needle while you are jolting along a Korean road.

Once upon a time there was a countryman of ours who jolted along the Korean road upon the springless cart of the native. For some reason he saw the necessity of threading a needle as he rode. When he came home to Nippon his friends did not recognize him; in him they only saw a curio—a man with his temper completely wrecked. All that I have to say is that he ought to have worked upon the "Sasanami" on the night of the 29th; we who have, can only find a light entertainment in his trials on a Korean road. The work done at last and we were about to heave a sigh of relief, when—and no number of exclamations would do justice to our feeling of the hour—once again the rope was in twain. Another eternity of trials in the dark; and it is well that the men of the Nippon Navy are permitted to shake hands with that refined state of mind called despair only on the pages of romance. When we made good the rope once again we had a distance to steam before we met the new day coming out of the eastern horizon.

And it was in the virgin light of the 30th of May, 1905, that we were permitted to behold the face of the Buddha in the distant form of our cruiser "Akashi," which bore down upon us.

Our troubles were over, and every one of us swore that we would not take ten lives in Paradise for the trials of the pitiless night in which we made the acquaintance of Vice-Admiral Rojestvensky.

The Fooling of the Mongrels

BY CHARLES G. D. ROBERTS

AUTHOR OF "THE HEART OF THE ANCIENT WOOD," "THE KINDRED OF THE WILD," ETC.

THE season of the early spring thaws was a time of anxiety and discomfort for the great Red Fox of the Ridge. He hated the wet and the slumping snows, and the hunt became a toil rather than a joy. His mate, moreover, being heavy with young, was not inclined to play and wrestle and run races as she had been. She hunted near home, but back among the rocks, of course, and never down toward the valley, and Red Fox brought home to her the larger share of his own captures. For his own part he now became particularly cautious, never going down into the Settlement at all. But he got into the habit of making a long, toilsome journey over the ridge and down into the next valley, and compensating himself for the extra hardships by taking easy toll of the farmyards at the foot of Ringwaak. He calculated that these depredations would never be laid to the charge of a fox living so far away as he.

But in this, as it proved, he was reckoning without allowance for his reputation. He wronged his own renown. When the folk under Ringwaak began to feel the attacks of a particularly daring and clever enemy they immediately thought of the big fox of the neighboring valley, of whose exploits they had heard such tales. Inquiry in the neighboring valley revealed the fact that of late nothing had been seen or heard of the notable marauder. From this it was readily inferred that he had shifted his field of operations. Thereupon there were many efforts made to trail the audacious raider back to his lair. But the trail invariably lost itself among rocks and ravines and tumbled thickets before it reached the summit of the ridge. Of traps and snares, of course, scores were set; but these were always treated with contumelious scorn or else given a wide berth. So it came about at last that a message was sent over to the next valley asking the farmers to hunt down their

troublesome furry outlaw, or at least to keep him at home.

Not without a certain pride did the Settlement accept this tribute to their famous fox's prowess. But at the same time it was agreed that something had to be done. The Boy, who had a personal interest in the great fox's achievements, smiled wisely and said that whatever was done Red Fox would not be the one to regret it. But Jabe Smith, the woodsman and trapper, undertook to lead a hunt, with his two dogs, that should end in Red Fox's final discomfiture or he'd know the reason why.

For some inexplicable reason, just at this juncture Red Fox's anxiety and apprehension increased amazingly. It was as if the stir of hostility down in the valley were conveyed to him by some subtle telepathic force, or as if some inquisitive blue jay, having overheard Jabe Smith's plans, had brought word in some occult way to Red Fox of the mischief brewing against him. Let the scientist, if he will, take the one explanation and the lover of fairy tale and fable the other. Or perhaps the responsibility of approaching fatherhood sharpened his memory, and he recalled certain tragic events which had forced his mother to flee from her old lair in the sunny bank. However that may be, one evening, after a fit of aimless restlessness, he ran and sniffed inquiringly about the entrance to that old den under the juniper bush. Something which he saw there stirred remembrance and decided him. Returning to his own lair, half by force and half by coaxing, he succeeded in ejecting his reluctant mate, who was now very near her time and much averse to quitting such snug quarters. This feat accomplished, he resolutely led her away up to the crest of the ridge to a sort of rude little cave which he had found in the side of a rocky ravine. This done, and his mate—because she could not help herself or make head against his

dominance—apparently reconciled, his restless solicitude vanished. He went back alone to the den in the bank and waited to see what was going to happen. He was now less careful about his hunting grounds and permitted himself, in his confidence, to range once more the lower slopes and the fringes of the Settlement.

When Jabe Smith was ready for the grand hunt he bethought him of that old den on the hillside where the Fox family had been "dug out" of house and home the previous year. He had not thought of this place before, because he knew that the scene of such tragic discomfiture and defeat would be the very last one that an ordinary fox would choose to live in. But it occurred to him now that Red Fox was no ordinary fox and might be cunning enough to regard such a place as the safest retreat of all. With the Boy as a critical and unsympathetic but much interested spectator, and two young farmers as assistant huntsmen, and his two dogs, a half breed hound and a big black-and-white mongrel, to do the real work, Jabe Smith led the way to that secluded hole in the bank far up the hillside.

"You'll never find him there, Jabe," jeered the Boy encouragingly, from time to time. And Jabe, having his own misgivings on the subject, maintained a strategic silence.

Within a hundred yards of the bank, however, the dogs, who had been quartering the soft and shrunken snow on every side, suddenly set up a chorus of excited yelpings and bayings. They had come upon a perfect tangle of fox tracks. Jabe Smith's gaunt face broke into a liberal grin, and, turning to the Boy triumphantly, he cried:

"There, now, what did I tell you?"

The two young men ran forward in exultant glee, expecting to find Red Fox securely cornered in the hole and to dig him out at their leisure. But the Boy, tho in his heart troubled and surprised, kept an undiscouraged face and advised the hunters not to crow too soon.

As the dogs were obviously confused by the tangle of trails, Jabe called them straight to the mouth of the old den behind the juniper. They thrust their noses into it eagerly, gave an inquiring

sniff, and turned away in scorn. Jabe's face fell, for it was obvious from their manner that no foxes had for a long time lived in that hole. The Boy tried to think of some sarcasm suited to the occasion; but before anything could be said on either side the dogs raced up the bank and set up a joyous chorus at the mouth of another cunningly hidden den.

"Now, what did I tell you?" cried Jabe again, with no great variation of vocabulary, and the two young men shouted, "We've got him this time!" But the Boy, obstinately optimistic, assumed an air of authority and remarked:

"There's *been* something there. But that doesn't prove it's there now! And you needn't think it'll be Red Fox, anyway!"

"We'll soon find out!" said Jabe Smith, taking some rags from his pocket and proceeding to smear them with a mixture of gunpowder and wet snow.

Having constructed the "spitting devil" to his satisfaction he tied it securely to the tip of a slender birch sapling, like a fishing pole. Then, calling the eager dogs to one side, he lighted the rags and thrust the blazing, sputtering mass carefully into the hole.

"Ef ther's anything in there, I don't keer if it's a tiger, that's goin' to fetch him out!" said Jabe. As all the on-lookers fully agreed with him there was no reply, but every one waited with eyes fixed intently on the hole. Slowly the sapling worked its way till it came to a resolute stop at a distance of about ten feet in. Here Jabe turned and twisted it hopefully, but there came forth nothing except volumes of evil-smelling smoke.

The Boy gave a little derisive laugh, and Jabe, dropping the end of the sapling, acknowledged regretfully that there was no fox at home.

"But he was there just a minute ago," said he doggedly, "or the scent wouldn't 'a' been so hot an' the dogs so worked up. An' it's Red Fox himself, or he couldn't 'a' got away so slick. He's somewhere's round, an' we'll git him." With this he sent the dogs off over the bank to pick up the trail by which the crafty fugitive had departed.

Red Fox meanwhile had been watching the whole scene from that safe little ledge of rock whence he had once before

made note of a kindred performance. This time, however, his feelings were very different. He knew his own powers and he pretty well understood his opponents', and he realized that as long as he took care to keep out of Jabe Smith's way he had the game in his own hands. With Jabe he would take no chances, but the dogs he would fool to the top of their bent. As for the rest of the party he was not greatly concerned about them. The Boy he knew was not hostile, and the two young men did not seem wood-wise enough to be dangerous. But there was one thing certain, he did not want the dogs to come sniffing about among the rocks on top of the ridge. He slipped down, therefore, from his post of observation and ran a fresh trail across his old one, toward the lowlands. Five minutes later the dogs were in full cry at his heels, and he could hear the men crashing along clumsily behind.

The running was heavy—deep, moist snow in the woods and sloppy, stick turf in the open spaces; but Red Fox knew that these conditions told more severely on his heavy pursuers than on himself. For a time he ran straight on, without doublings or tricks, in order to get the dogs well ahead of the slow-going men. When this was accomplished to his satisfaction he amused himself for a minute or two with wild, fantastic leaps from trunk to trunk in a patch of felled timber, and then circled back to see what Jabe Smith was doing. He felt it absolutely necessary to know Jabe's tactics in this contest before finally deciding upon his own. In this backward reconnaissance he ran at top speed, and was back within a half mile of his starting point while the puzzled dogs were still whimpering about the patch of felled timber. Fast as he ran, however, he kept all his wits about him, speeding through thick underbrush and never exposing himself to a possible shot from that dreaded firearm of Jabe's. And suddenly, not fifty yards off, he caught sight of Jabe himself, patiently watching a runaway.

This sight gave Red Fox a pang of sharp apprehension, so terrible seemed the cunning which had led the woodsman to keep watch at that particular spot. And there beside him, sitting on a stump and motionless as the stump,

was the Boy. It was just the place where Red Fox *would* have run under ordinary circumstances or if he had been an ordinary fox. It was only, indeed, his unsleeping caution that had saved him. Instead of keeping to his runway he had warily paralleled it at a distance of about fifty yards, and so his cunning had fairly outdone that of the backwoodsman.

Watching his enemies with almost a touch of contempt from his safe hiding Red Fox lay down for a few minutes' rest. Then, hearing the dogs at last in full cry on his back track, he rose up, stretched himself, gave a yawn that seemed to nearly split his jaws, and stole around behind Jabe and the Boy, whose eyes were now fairly glued to the runway in the momentary expectation of his coming. He yawned again in scorn, ran swiftly back to the door of his den, zig-zagged for a couple of minutes in that tangle of tracks just below it, then headed down along the shore of the brook, whose channel was now open wherever the current was swift.

As he ran his plans took definite shape. His object being to lead the chase far away from the ridge, he had no motive for puzzling his pursuers any more than enough to keep them from pressing him too closely. The brook was too swollen and angry to be easily fordable except where the ice stil lingered in the stretches of dead water. But in one place he crossed it by skillful leaps from rock to rock amid the foam, because he knew that the dogs were less sure footed than he and might possibly have some trouble in the crossing. Half a mile further down, where there was firm ice, he crossed back again, gathering from the voices of his pursuers that they had not found the crossing as difficult as he had hoped they would. Then he put on a burst of speed and made for a remote little farm on the outskirts of the Settlement, where he thought he could give the dogs something to puzzle over while he rested for another long run. Having thoroughly explored every farmyard for a half score miles about, he knew just which ones had any tactical advantages to offer him.

At the farm in question the chicken house was a lean-to shed set against the

side of the cow-barn. The lower edge of the roof was about four feet from the ground, and beneath it was a small hole leading to a spacious hollow under the floor. From a thicket just outside the farmyard Red Fox took a careful observation to assure himself that there was no one about the premises. The wagon was gone from the shed over on the other side of the well so he knew the farmer was away. There was no face at the kitchen window. The big gray cat dozed on the doorstep. He darted to the hole under the chicken house and with some difficulty squeezed himself in.

This feat accomplished, he promptly squeezed his way out again. Then, standing in his trail, he made a splendid leap straight into the air and landed on the sloping roof of the lean-to. From here he ran nimbly up to the roof of the cow-barn and down the other side and across the high road and into a field of thick young evergreens. Here he lay down with a sense of security to enjoy a well earned rest.

It was fully five minutes after this before the dogs arrived, their tongues hanging out. They ran straight to the hole under the chicken house, and there, in spite of their fatigue, they set up a wild chorus of triumph. They had run their quarry to earth. The hole, however, was so small that they could not force a way in, and the ground all about it was still frozen, so they could not dig an entrance with their claws. The black-and-white mongrel kept on scratching valiantly, however, while the half-breed hound, keeping his nose close to the foundations, made a swift but careful circuit of the cow-barn to assure himself that there was no other exit. Had he ranged away from the foundations he would, of course, have picked up the crafty fugitive's trail where he had made a great leap from the roof to the haystack and thence far out into the field. But the hound was methodical and kept close to work, and he came back to his companion, therefore, quite assured that the quarry was there in hiding.

When, some ten minutes later, the hunters came up panting and hot they were as completely deceived as the dogs. Even the Boy, when he saw there was but one exit, and that guarded by the

self-satisfied dogs, was fain to acknowledge that poor Red Fox's sagacity had failed him at last. With the fugitive at last securely cornered there seemed to be no need of further haste, so a leisurely council of war was held behind the chicken house, the Boy sorrowfully aloof. At length it was decided that the only thing to do was to stop up the hole, then get leave to take up some boards of the hen-house floor.

This extreme measure, however, was not to be carried out. While he was talking about it Jabe Smith chanced to lean upon the hen-house roof, just at the point where Red Fox had made his cunning leap. It chanced that Jabe's nose, tho not so keen as the Boy's, was nevertheless capable of detecting the fresh scent of a fox on a surface so absorbent as a roof of dry shingles. He sniffed suspiciously, smelled the roof carefully as far up as he could reach, then turned to the Boy with an air of humbly confessing defeat.

"The critter's fooled us again!" said he.

"How? What do you mean?" cried the Boy, with glad incredulity, while the other two stood bewildered.

"He's not in there at all!" said Jabe, recovering himself. "He's gone up yonder over the roof. We'll find his trail all right somewhere round behind the barn! You watch!"

Ordering the reluctant dogs to follow, he led the way around behind the barn, and then, with shrewd discernment, around the haystack. Here the dogs picked up the trail at once and were off with savage cries, furious at the way they had been fooled. But as for Jabe, he was filled with a sense of triumph in the very face of defeat. The Boy had said humbly: "That beats me, Jabe. You know more about them than I do, after all. However did you find out where he'd gone?"

"Why," said Jabe, shamelessly prevaricating, "I just thought what would be the very smartest kind of a trick, an' I knowed that was what that red varmint would be up to!"

Red Fox meanwhile, resting in his covert among the dense young evergreens, was filled with indignant amazement at hearing the cries of the dogs so

soon again on his trail. What had gone wrong with his admirable stratagem? Promptly and properly he laid the blame upon the dreaded Jabe, and his sagacious eyes narrowed with something like apprehension. For a moment he paused, considering anxiously. Then, making a short circle, he doubled back and ran along parallel with the road, keeping himself carefully out of sight lest he should attract a gunshot. He was heading for the mill pond at the further side of the Settlement, where a small stream, a tributary of his own brook, had been dammed and harnessed and forced to do the grinding and wool carding of all the Ringwaak region.

Tho the stream at ordinary seasons was small, the pond it fed was large, and just now, under the stress of the spring thaws, a heavy volume of water was pouring noisily through the open floodgates of the dam. Red Fox's mood was now an ugly one. At no time anything approaching a humanitarian, he now felt a trifle harassed and crowded. If all his pursuers—the dogs, and the men, and the harmless Boy together—had had but one neck, a long, slender neck like that of a wild goose, what keen joy it would have given him to put his fine white teeth crunching through it! He was ready to take great risks in the hope of doing some hurt to his persecutors.

The dogs, following a plain trail, with the scent so hot that it hung in the air, were now following close, with the hunters far behind and out of gunshot. When Red Fox reached the edge of the mill pond, which was still partly frozen over, he stepped out upon the ice, testing it shrewdly. Then, returning to the shore, he ran on down toward the dam.

For a space of thirty feet or so above the roaring floodgates the pond was open. The edges of the ice were rapidly rotting away as the water surged up beneath. On the bank above Red Fox hesitated, lagging as if exhausted, and turned as if he were at last brought to bay. Seeing this the dogs broke into fiercer clamor and rushed forward madly. At last it seemed the game was in their hands.

Not till they were within a dozen paces of him did Red Fox stir. Then, whipping about as if defiance had given way

to uncontrollable fear, he darted straight out upon the dangerous ice. Either instinct or a peculiarly shrewd and unerring judgment told him that the ice-fringe above the sluice was strong enough to bear his weight if he went swiftly and smoothly. With the dogs a few yards behind him he sped safely over. The next moment, above the roar of the sluice, came a crunching sound and a startled yelping from the black-and-white mongrel. Looking over his shoulder with narrowed eyes of triumph Red Fox saw his enemies in the water, pawing wildly at the rotten edges of the ice, which kept breaking away.

Past the drenched strugglers the bits of broken ice went streaming, to vanish in the loud turmoil of the fall. Red Fox ran on to the shelter of a bush up the shore, then turned to enjoy his revenge. The dogs were still clutching wildly at the ice and the treacherous ice still yielded under their clutches. As he watched, a larger piece, some three or four feet square, separated itself under the attack of the black-and-white mongrel, just as he succeeded in dragging himself out upon it. The next moment it slipped swiftly off with its exhausted passenger, wallowed into the roaring floodgates, plunged over the fall and vanished amid the rocks and smother below. With deepest satisfaction Red Fox observed this tragic end of one of his enemies. Then the men came in sight once more; so he crept away stealthily beyond gunshot and continued his run over toward the hills overlooking the Ottanoonsis Valley. But there was really no need of his running any further. When the hunters arrived on the bank of the pond the half-breed hound was just dragging himself out of the water, thoroughly cowed. The mongrel was nowhere to be seen, but it was easy to guess what had happened to him. The party halted and Jabe whistled the dejected hound to his feet and sympathetically patted his wet head.

"I saw Red Fox," said the Boy gravely—sorry for the black-and-white mongrel's fate—"just slipping into the woods 'way up yonder!"

"Reckon we might's well be gittin' back home!" remarked Jabe, turning on his heels.

A Theatrical Press Agent's Confession and Apology

[The author of the following frank article is an honest and most estimable gentleman, enjoying our sincerest esteem and personal acquaintanceship. His parents, we believe, were foreign missionaries.—EDITOR.]

AT the outset of my story I want to say that I have never noised the report of my own death, never "mysteriously lost" my client's diamonds; never tried to break into a jail, nor ever hewed so close to the line of duty as to land me there by means of the law's strong arm. This is not a burglar's confession, tho it begins like one. I have known heroic workers in my calling who have done all four—but let that pass. Shakespeare remarks somewhere that there be land rats and water rats, land pirates and water pirates, and while denying burglary *et al.*, I am quite willing to be classed as the pirate of the newspaper profession—a theatrical press agent.

I first flew the Jolly Roger a few years ago in response to the urgings of a fellow journalist who had fallen from the estate of a managing editor into that of a producer of plays for "rube" consumption. He had a silken voice and an ingratiating manner, which were taxed to their utmost at the end of poor seasons in staving off the requests of actors for back pay. At the time I speak of, however, he rejoiced in the possession of a star of the sixth or seventh magnitude, whom he meant to exploit in the society drama. The star and her friends had raised a little money for the expenses of the tour, and all was rosy.

"My dear boy," said the manager, winningly, "the newspaper business is but a stepping stone to other callings. Where you earn probably two thousand a year as a newspaper writer, you will earn from three to five thousand a year as a press agent. And then think of the independence you gain—no more white slaving at the editor's desk until all hours of the night; master of your own time and movements; all that is required being to get plenty of good articles into the papers and attend to the necessary busi-

ness details. And the prospect of advancement, too—what's to hinder your becoming a Billy Brady or a Kirke La Shelle? Tell you what I'll do—pay you from the start a salary \$500 a year better than your newspaper gives you! Will you take it?" Whereat he smiled.

I closed with the offer.

"Now the first thing," said I, "I want an interview with the star."

Just a shade of annoyance crossed the manager's face. "W-e-ll, I—think—that—can—be—arranged."

I got my interview and enough good stuff out of it to last me in the way of newspaper copy for some days. Then I sought the manager and requested more facts.

"Facts," he said oracularly, "are dangerous in this business. If I were you I should not worry about facts."

"You expect me to make bricks without straw?"

"Oh, no," he replied, "you want something to go upon. Think up something yourself. Anything you think of goes." Whereat he departed to interview his backer on high finance.

"I thought of" the play, the dramatist, the actors, the stage manager, the railroad traffic agent, even the stage carpenter and the property man. I guess for a time I must have made life miserable for some of these gentry, trying to extract news (where there was no news) out of brainless actors and colorless *attachés*.

Finally the whole secret of the thing came to me, as if by inspiration. "Fool!" I said to myself. "You have been trying to play the Hume and the Macauley to these people when regarding the whole kit of them there's absolutely nothing worth putting pen to paper. You must dramatize them, my boy, dramatize them. The talents of a Dickens or a Dumas are required here, not the cold historian of

fact. The plausible, not the actual, should be your aim. At any rate, you can make the late Baron Munchausen look stupid—and unnecessary."

The flag was up, my pirate craft was scudding in a ten-knot breeze, and the following week I brought her to port in a remote New England town, where we were to open our tour. On the morning of my arrival the newspapers displayed lurid headlines announcing that the business manager of "The Girl from Dresden" company had committed suicide by throwing himself into a nearby lake. For evidence, his coat and hat had been found at the lakeside; and a swarm of reporters were buzzing about the local theater manager, who was loudly bewailing the fate of poor W—— when he was not shifting his gaze to wink at me.

"That's a silly trick," I remarked after the reporters had gone. "W—— must turn up and make himself known in the next town and then the whole story is queered."

"Never thought of that," said the manager. The event proved as I had predicted. W—— was seen in the flesh in a neighboring city the very same day, the State papers geyed him unmercifully and the populace was so disgusted at the fake that they practically boycotted the unfortunate "Girl from Dresden," and the company itself was stranded. Instead of the high tragedy of suicide, W—— suffered the real and sordid one of walking the railroad ties back to New York.

Another's failure did not daunt me. I knew that my star, as it happened, was versed in Indian lore, and I decided to organize a great warlike demonstration in her honor among the Indians of a reservation not far distant. This was no easy task. The Indians were as comfortable and lazy a set of redskins as you ever set eyes on. They ate, slept and smoked in huge content; the sound of one of their ancestors' warwhoops would probably have scared them out of their wits; and the notion of going on the warpath and engaging in mimic battle was as distasteful to them as was the appearance of the British men-of-war to Peter Stuyvesant and his fat New Amsterdam councilors in 1661. But an Indian likes the green wampum issued

by Uncle Sam; and the show of a great deal of it and the gift of a little induced them to elect Madame —— a member of the tribe forthwith and to promise to initiate her the next week by means of a genuine snake dance and terrifying martial orgies. When I carried the story to the papers I saw that I had made a great hit. Not only did they print columns of it but special correspondents telegraphed it broadcast over New England, even unto Boston, Providence and New Haven, so that Madame —— became the most talked of woman in the Puritan country for many a long day.

From New England we traveled leisurely across New York State, taking only the two and three night stands, and into Ohio, where the finger of dull business indicated to me that unusual exertion was necessary. The State Game Warden of Ohio at that time was a very busy man. Besides his usual onerous duties of protecting the feathered and furry creatures of forest and field, a freak law obliged him to make active war on milliners, citizenesses and sundry others who wore feathers or had feathers of game birds in their possession. The spectacle of the solemn and portentous State Warden battling over aigrettes with male and female milliners—yea, plucking them, if stern duty demanded, from the very headpieces of fashion's votaries—caused me to shriek with laughter. Then I smiled broadly as the thought struck me that if the Warden made such war on native Ohioans he surely ought to extend his hostility to our traveling company. One could fairly see him rising from his seat in the pit of the theater with dreadful utterance: "In the name of the State of Ohio I command you to take off those hats!"

I called him up on the telephone.

"Mr. Warden, the ladies of our company wish a permit from you to wear their aigrettes on the stage next Tuesday."

"What?" he snapped.

"Theatrical company—plays Great Southern Theater—ladies wear feathers in their hats—"

"They mustn't—it's against the law."

"But they will—"

"They won't!" he roared.

"I say they will."

"Young man, I warn you," the tones came slowly back, "defy the laws of this sovereign State at your peril! I'm after the milliners right now, but if you meddlin' New Yorkers come in here, settin' my authority at defiance, I'll close the show and lock up every one of you!" And he put the receiver back on the hook with a bang.

As every journalist knows, a quarrel (next to a scandal in high life) is the best kind of a story, and I was not slow in carrying my version of the fracas to the editors. The newspapers swallowed the tempting bait, hook, line and sinker. The anti-feather crusade was already warm, and this fed the flame. The merry war raged for a week; some were for the ungallant Warden, others for the actresses; but when the company came to town it was found that not a woman had a feather in her stage hat! Whether the acting manager confiscated all the feathers beforehand or whether there really weren't any feathers at all, I haven't been able to discover.

We were now getting down into Henry Watterson's demesne. That eminent publicist was blowing off steam about the "wickedness" of Newport and the Four Hundred. From our point of view no journalistic whale or minnow fish could have spouted at a better time. We carried a play of "types." That is to say, our dramatists, instead of going to the trouble of creating original characters, had copied the chief figures of New York's social pageant, tagged them out with fictitious names, and set them forth in a lame and halting imitation of how society wears clothes and makes love. Lest any doubt should remain in the bucolic mind as to who they were, my press notices carefully explained the identity of each mime and prototype and gleefully narrated the manner in which the Four Hundred and their theatric counterparts surveyed each other betwixt stage and stage box at the New York presentation. I had very little to do in Louisville. Each editorial thunderclap of the *Louisville Courier-Journal* was as an army with banners to our cause. Honest John Macauley's face glowed with delight as he saw us turn people away from his theater at three packed performances. Doubtless, a part

of his share of the winnings went to pay a stranded actor's board or to help some unlucky dog of a stroller back to his home town. For that is Honest John Macauley's way.

The South liked us from Jacksonville to Louisville and from Norfolk to Memphis. If it didn't like our play, for the most part it was too polite to say so. There are no better fellows in the world than Southern newspaper men. Dogmatic on social and political questions, they are yet singularly free from meanness, jealousy and the other traits that outcrop wherever industrial competition grows too fierce. The story that carries its Open Sesame to their hearts is of the beautiful Southern girl in reduced circumstances who has taken to the stage in hopes of becoming a Bernhardt or Duse. We had one—I mean both the story and the girl. She hailed from Norfolk and she crowded the doors for us both there and in other places. What mattered it that she couldn't act, was a silly chit off the stage and a gawk upon it—the Southern people, in their pride and loyalty of race, applauded her as frantically as if she had been an accomplished star. And the dry goods merchant's son in Chattanooga! He was really a clever chap, a dancer and songster, a thorough comedian, whom his father had tried to make something grave and reverend of, and had failed. Throughout the Central South that boy was a veritable pillar of the drama.

As we settled down to the routine of steady traveling I realized more and more the importance of the prosaic business side of my calling. Let me explain that every theatrical performance is the result of a contract between the proprietor of the "house" and the manager of the touring company to share expenses and divide receipts. The local dignitary furnishes theater, tickets, programs, stage setting, employees, a stated quota of advertising, the use of billboards; the traveling manager provides play and players, advertisement and newspaper copy, scenery, costumes and "paper," meaning lithographs and posters. In smaller towns the company gets seventy-five and the house twenty-five per cent. of the receipts. In New York and other leading cities the parties share evenly.

Weeks in advance the agent knows his route—that is, the series of towns he is expected to cover. He carries with him the contract for each town, in which several important items are left blank until he can have a face-to-face interview with the local manager. And right here the theatrical agent's business troubles begin, for moot questions are many and the country manager is reputed to be craftier than the heathen Chinese.

First as to passes. Your local magnate is suspected, often unjustly, of using his allowance of newspaper passes for private ends. There is a tale of one who paid his butcher and baker with these punched tickets; another, it is darkly hinted, sells his passes at a discount, while of a third it is whispered that, disregarding the formality of tickets, he is accustomed to let favored patrons into the show by means of a private entrance. Therefore, while the manager pleads for liberality, the agent sternly insists on cutting down the free admissions. Fifty tickets are an ample free list for a theater in a town of fifty thousand inhabitants; the newspapers get thirty of them, and the remainder is divided between owners of billboards and window displays, musicians, truckmen, the local police and others. More complex is the pass problem elsewhere. When a show stays a whole week it is essential that the first night house be "well dressed." Dressing a house means filling the bare spots with complimentaries, who look like paid admissions and who will not give away the secret to their neighbors. It would be a mistake to hand these extra tickets to newspaper employees, for then every newspaper would know that that play was not drawing a large paid audience. So recourse is had to the department stores, whose well-dressed floorwalkers and salesladies like nothing better than to pose as aristocrats paying a couple of dollars apiece for their evening's fun. And I happen to know of a theatrical manager who went this trick even better by marshaling a corps of deaf mutes as deadheads. They were drilled to applaud at the right places and came off with flying colors.

As regards prices of admission, the wise agent will usually let the local manager have his own way. The latter

knows how much his patrons will pay, and the agent doesn't. Next comes the fight over extra advertising. If the newspapers are to give extra attention to the show the theory at least is that extra money must be paid. But how much? Perhaps the local manager is at feud with the newspapers; he holds a yearly contract with them and vows he won't spend a cent more. At the other extreme is the local manager who shakes the agent warmly by the hand, pats him on the back, and informs him that "we really must use so many lines in the *Daily Clarion* or the whole show will be ruined." The agent raises his eyebrows; he has heard that cry before.

"What's the *Daily Clarion's* rate?" he nonchalantly asks.

"Two dollars an inch."

"Guess we'll have to go in."

At the very first opportunity our traveler pays a quiet call to the newspaper office, and, inquiring the rate, perhaps gets this reply:

"One dollar and a half an inch."

Thus is the manager's swindle exposed. Could he have induced the attraction to pay a rate twenty-five to thirty-three per cent. higher than the newspaper rate he would have gotten his own share of the advertising free. But his shallow cunning has failed. A cleverer rogue gets the newspaper to make him a low private rate and to issue a public rate card that is ever so much higher. I believe this sort of thing, in the phraseology of trusts, is styled a "secret rebate"; in the downright language of theaterdom it is denominated stealing. Comparatively few managers are guilty of it.

Five to ten per cent. of the prospective gross receipts is a liberal allowance for extra advertising. Thus if a play expects to do a thousand dollar business fifty to a hundred dollars must be given the newspapers in addition to their regular stipend from the theater, and this extra burden is borne by house and company on the same basis as their sharing of the receipts.

After the often stormy interview with the local manager the agent meets the billposters and baggagemen. I found these a rough but good-humored gentry, easily coaxed but never to be driven.

The billposter, like a gnome, inhabits the darkest and most cavernous recesses of the theater. In an obscure corner of his cellar lies your paper, a heavy bundle, expressed or freighted from New York or Chicago and bearing your name and address. You open it and lay out the gorgeous sheets upon the table in exactly the order you wish the man to put them on the "stands." You instruct him further about the window display, for which small lithographs or quarter sheets are used; and, above all, you try to make friends, for the advertising agent can work you good or ill as he pleases. Paper, by the way, is a heavy item of expense, anywhere from one hundred and fifty to five hundred dollars a week being spent by a traveling company on this account alone.

With the baggagemen contracts are made to haul the scenery and trunks to and from the theater, and with the railroad officials the movement of the company from one town to the next must be arranged. The multifarious duties I have just described, together with the newspaper work, make the theatrical agent's day long and strenuous. His salary and official expenses total perhaps one hundred dollars a week, a sum insignificant as compared with the benefit he confers upon the show.

The methods of newspaper publicity vary from town to town. In the smallest places the work consists in inserting the advertisements and placing the conventional reading matter in fairly mathematical proportion to the amount of money paid. Editors are not anxious for original matter, nor would most country editors know the difference between articles prepared in New York beforehand and matter written especially for the occasion. But there are some amusing stunts to be done in these smaller towns. In one I personally canvassed every business man in the place. In another the approval of the local college president—a true-blue Presbyterian—was absolutely necessary to the success of the piece. From a third I recall a vivid night journey of thirty miles by slow freight train to get up a "theater party" in a howling backwoods wilderness. Characters are often as grotesque as incidents. Never will I forget the

cotton mill town where the barber proudly informed me that he ran the theater and would be pleased to arrange prices and advertising as soon as he had removed my beard; the classic Vincennes, Ind., where the manager (who was also a livery keeper) "fixed up" business between strokes of the currycomb; or the other Indiana town in which the manager drove a pretty trade in gravestones and mortuary monuments when he wasn't purveying vaudeville. I had a dark suspicion that he was the undertaker, too, but I dared not hint it.

These things are to laugh; but the difficult work comes in cities of a hundred thousand inhabitants and upward. In such places, while they are yet night stands, there is a different theatrical attraction every night in the week; and keen must be the press agent whose work stands out above that of his rivals and thus causes his attraction to draw audiences away from theirs. It is not money that counts here, but brains.

Toward the end of the season often comes a spell when the best possible efforts result only in disaster. Wonder tales, prize guessing contests, offers of a house and lot with each ticket, will not draw the people to the box-office. One feels they would receive an earthquake with indifference, and merely turn over in their sleep at the sound of the last trump. It is a wise manager who executes a quick retreat under such circumstances; yet too often companies go on and on from week to week, hoping against hope, to their utter ruin. A disastrous May in Michigan forms part of my experience. The beginning of the month was as sultry as August; on all the fences and side walls bills showed the prancing steeds and gilt machinery of our all-potent rival, the circus; and from Detroit to Grand Rapids and back again I had the eerie feeling of traversing what for me was the Land of the Dead. Had the manager closed the show eight weeks earlier he would have come out a winner, or, at least, not suffered in pocket; as it was, the season's tag plunged him in debt and nearly bankrupted star and backer. To the honor of the star, be it said, the salaries were paid.

The secret of success in press work is inventiveness. Moralists may frown

at the faking and mendacity sometimes involved; but, on the other hand, it seems worth while pointing out that nothing great has been done in the world's history by mere literalness. Even religion has its apologues, science its hypotheses and history its romantic fictions, which often illustrate character better than do the facts. I started out in press work an honest but misguided literalist. This of course was an impossible attitude. Next I determined to *make* news rather than to manufacture it. And there is a distinction. I can fake news out of whole cloth—have done so—but what I prefer and enjoy is to create the conditions that bring about an actual event and then describe that event with all the ability at my command. And therefore I do not consider myself such a very

black pirate after all. The exercise of the imagination has widened my horizon wonderfully, has put me *en rapport* (you may smile at this) with the labors of editors, statesmen and business organizers everywhere, and I believe has not left me a whit less conscientious as to matters that really count. I have been graduated from the class of traveling agent to that of a metropolitan press agent, commanding better and certain pay and a more regular mode of life. In the future I hope to lift the curtain that veils the methods of New York's theatrical romancers. Perhaps there lurks a Balzac or a Thackeray, a Scott or a Stevenson among them—who knows? For of imagination—nothing else—are the works of genius, as of press agency, wrought.

NEW YORK CITY.

The Sacrifice

BY GEORGE BENSON HEWETSON

[The late Grand Duchess of Saxe-Weimar, who has just died at the age of twenty, was very unhappy in her married life. As a child of eighteen she was persuaded to marry the Grand Duke, who is extremely wealthy, but the Princess did all she could to escape from the fate she dreaded. On the evening before the marriage she declared she would not marry him.—*Vanity Fair*, January 23d, 1905.]

Dead is the sapphire of the sea;
The sky's vast rapture overhead
Is cold and darkness unto me,
Still living, though amongst the dead;
And meaningless the words he said
Whose voice proclaimed us man and wife,
For with those words went out my life,
The luster of my soul was shed.

They wedded me to gauds of earth,
To fields and woods, a hall, a town,
To scrolled vacuities of birth
And blazon of a ducal crown.
Lifeless to me thy smile, thy frown;
Joyless thy wealth of wedded lands;
For every wedded heart demands
A heart that it may call its own.

But, in the clutch of loveless fate,
I shall go lone amongst my kind,
Too cold to love, too dead to hate,
To Life's majestic meanings blind;
To wedded thralldom unresigned,
And severed by its cold decree
From him whose love is all to me,
Whose image haunts my perished mind.

O, for the rapture of that kiss
Which fuses two lives into one!
Life's morning-ecstasy of bliss,
Which sets not with its setting sun,
But, in Love's ampler day begun,
Grows with the life that never dies;
O, for the love-look of those eyes
Which now these lifeless eyes must shun!

Then take my corpse, for such it is
Thy eager arms shall now enfold;
Dead are the lips which thou shalt kiss,
For all Life's fires in me are cold.
And let the gruesome truth be told—
This sin of murder is not thine,
But theirs whose blood is kin to mine,
Who sold my life for minted gold.

ST. MARY'S LODGE, SEATON DELAVAL, ENGLAND.

CHARLES A. BRIGGS

The Question of Orders

BY CHARLES A. BRIGGS, D.D., D.Litt.

PROFESSOR OF BIBLICAL THEOLOGY IN UNION THEOLOGICAL SEMINARY, NEW YORK CITY

IT is commonly supposed that the question of orders is one of the most difficult ones now obstructing the way of the reunion of Christendom. I do not think so. In fact, ministers are constantly passing over from the various non-Episcopal bodies and accepting ordination in the Protestant Episcopal Church, and others are passing over into the Roman Catholic Church and receiving orders from Rome. It is possible that some are deterred from making these changes by the requirement of ordination into another ministry, but I doubt whether there are many such. Those who make the change do it for such important reasons that the humiliation of another ordination becomes a matter of minor importance. It is my opinion that if that were the only barrier remaining to a reunion of all English-

speaking Protestant Christians in the Anglican Church that barrier would fade away into nothingness. It is also my opinion that if that were the only barrier to a reunion with Rome that barrier would not deter any considerable number from accepting Roman ordination.

At the same time it must be recognized that in the common opinion of the ministry this is one of the most important barriers, and, in fact, every minister who thinks of making the change, whether into the Protestant Episcopal Church or into the Roman Catholic Church, is compelled to confront such a humiliation. Therefore, it is a matter of some importance to study this question seriously, searching if there be not some way in which this difficulty may be overcome, or at least diminished.

The difficulty of passing from one denomination to another is not, however, confined to the question of orders. Even those bodies which recognize the ordination of other bodies still make such demands in the matter of dogma, or rules of life, that, in fact, changes from the Methodist Episcopal Church to the Presbyterian, for example, are more difficult and less frequent, so far as my observation goes, than from the Methodist Episcopal to the Protestant Episcopal.

The decision of Pope Leo XIII as to the validity of Anglican orders has lifted the whole question of orders into a better position for further investigation. The essence of the question was whether the Anglican Reformers in their ordinal had the intention of ordaining a real priesthood to offer real sacrifices. The decision that such was not their intention seems to me one that all should recognize as final. But the question still remains open whether such an intention is essential to valid Christian ministry; and so the question becomes one of doctrine—namely, what are the essential qualifications of the Christian ministry?

There are several important functions of the holy ministry. The Sarum ordinal, on which the Anglican ordinal is based, mentions as the functions of a priest "*offerre, benedicere, praeesse, praedicare, conficere et baptizare*"; but no one contends, so far as I know, that it is necessary to mention all these in the ceremony of ordination. The practical question is whether the omission of the sacrificial function from the intention of the ordinal invalidates it. It seems to me that that question must be answered in the negative. Since the decision of Leo XIII an ancient ordinal of Serapion has been discovered which makes just this omission, and it has not yet been shown that a presbyter cannot be a presbyter unless he be a sacrificing priest.

Furthermore, while it is true that the Anglican Reformers removed from the Sarum ordinal what they supposed was the Roman conception of priesthood, and did not substitute for it the ancient Catholic conception, there is no evidence that they designed to exclude the latter. They were in a position in which such discrimination was impracticable. In

their retention of so much of the ancient formula as they did in their work of reform they showed the intention to perpetuate the pre-Reformation ministry in all that they regarded as essential to it. Their intention was certainly to ordain and perpetuate the ministry which Jesus Christ instituted, which his apostles ordained, and which the primitive Church transmitted. Their purpose in reform was simply and alone to remove the corruption of the Medieval Church. If now in the removal of corruption they also removed many things that were not corruptions, but belonged to the genuine Christian inheritance, their intention was changed in a measure from that of the pre-Reformation Church, but only so as to do exactly what they supposed Jesus and his apostles would have them do. They intended the Master's intention, the apostles' intention, the intention of the primitive Church, even if they were mistaken, even if one could say wofully mistaken, in the contents of their intention. If then they omitted from their ordinal the mention of such an essential thing as the sacrificial character of the priesthood, that does not destroy their intention to ordain a ministry with all that Jesus Christ intended it to have.

If their successors in the Anglican ministry have learned better what were the functions the Lord designed his ministry to have, and what was the mind of the primitive Church in this regard, I see no reason why they should not enrich their doctrine of the ministry and enrich their intention also in the use of the ordinal. It would be better to give expression to that better knowledge by changing the formula to correspond. But this change of opinion has not yet become the common mind of the Anglicans, and, therefore, such change cannot yet be made in the ordinal. It is not necessary, however, to break up the Anglican Church on that account. It is far better that each party should use the existing ordinal with its own mind and intention, supplying any supposed defects of the formula with mental additions, having in view not so much the mind of the Anglican Reformers as the mind of the existing Church.

Even from the Roman point of view,

while Rome may not be able to recognize at present the Anglican priesthood as a real priesthood, she may yet recognize them as priests in the sense that the ordinal in its original intention designed them to be, while she requires of them ordination to a real priesthood. It would be in the interests of Christian charity if a formula of ordination were made to fit the case of Anglican priests and other Protestant ministers, and that they should not be treated as if they had had no Christian ministry at all, beginning as if they were students fresh from a Catholic seminary.

If Anglican orders can be defended only on the ground of the intention of the Anglican Reformers to ordain and perpetuate a Christian ministry, such as Jesus Christ and his apostles intended, the orders of the Lutheran and Reformed Churches may be defended on exactly the same grounds, from the same intention. If they omitted important items in the ordination of their ministry they did not omit this same intention. The substance of the intention of the Anglicans and the Protestants of the Continent was the same. The only important difference was that the Anglicans retained the *episcopal* succession; the Protestants of the Continent retained only succession through the *presbyters*. This difference was due more to the providence of God than to the deliberate choice of the Reformers. Under these circumstances the Anglicans, if they really desire the reunion of Christ's Church, ought to follow the Anglican Reformers and many of the great Anglican divines of the sixteenth and seventeenth centuries, and recognize the orders of other Protestants as essentially valid. If the Anglicans may enrich their doctrine of the holy ministry and also their intention in the ceremony, so may the other Protestants also. There is no serious barrier in the way except the common traditional opinion among Anglicans. The Church of England and the Protestant Episcopal Church in this country have never, by any official decision, pronounced Lutheran or Presbyterian orders invalid. If Pope Leo XIII has shut the door to Rome in their face, they have not as yet shut the door to the sister Churches of the Reformation.

Hooker lays down the principle on which they may act in such recognition:

"There may be sometimes very just and sufficient reasons to allow ordination made without a bishop. The whole Church visible, being the true original subject of all power, it hath not ordinarily allowed any other than bishops alone to ordain; how be it, as the ordinary course is ordinarily in all things to be observed, so it may be in some cases not unnecessary that we decline from the ordinary ways."

"Where the Church must needs have some ordained, and neither hath, nor can have possibly, a bishop to ordain; in case of such necessity, the ordinary institution of God hath given oftentimes and may give place. And therefore we are not simply without exception to urge a lineal descent of power from the apostles by continued succession of bishops in every effectual ordination."—*Ecclesiastical Polity*, VII, 14th.

Bishop Joseph Hall applies this principle to the Protestant Churches of the Continent:

"Yea, if the last Bishop of Geneva had become a Protestant and consented in matters of doctrine to Calvin, Farel, Viret, have you, or any man living, just cause to think that the citie would not gladly have retained his government still and thought themselves happy under such a protection? Would they have ejected him as an enemy whom they might have enjoyed as a patron? Would they have stood upon his Episcopacie, while they had his concurrence in the truth of religion? No man that hath either brains or forehead will affirm it, since the world knows the quarrel was not at his dignitie, but at his opposition to intended Reformation."

"Thus those learned divines and Protestants of Germany, wherein all the world sees the Apologist professeth for them, that they greatly desired to conserve the government of bishops, that they were altogether unwillingly driven from it; that it was utterly against their heart, that it should have been impaired or weakened; that it was only the personal cruelty and violence of the Romish persecutors in a bloody opposition to the doctrine of the Gospel which was then excepted against."—*Episcopacy by Divine Right*, 1640, pp. 7-12.

It is true that Joseph Hall would not bring the Nonconformists of England and the Scottish Presbyterians, who deliberately deposed their bishops, under this rule. But he was blinded by the conflict in which he was engaged, and the Anglicans since his time have too often wrapped themselves in the prej-

udices born of the civil wars of England and the bitter ecclesiastical controversies that continued through the whole of the seventeenth century.

Bishop Hall and Archbishop Laud and the Scottish bishops who were deprived represented prelatical assumptions and despotism that would not be tolerated anywhere in the Anglican world at the present time. I doubt not if the American House of Bishops were composed of such bishops, and such bishops only, the American Episcopalians would throw them off in the interests of freedom of conscience, even if they had to get on without any bishops at all. The battle of Nonconformity and of presbytery was not so much against episcopacy, as against the intolerable yoke of prelacy. Therefore, in my opinion, Hooker's principle really applies to the situation in England and Scotland as well as to that on the Continent.

At all events, in the present situation of affairs some things might be done that would lessen the difficulties in the way of reunion. The General Convention of the Protestant Episcopal Church might frame a form of ordination which would recognize what other religious bodies actually intend in their ordination of their ministry and supplement it by imparting what they did not intend. Why should they deny the validity

of the ordination of other religious bodies so far as it goes, even if episcopal ordination should be insisted upon in addition. Even if the ministry be defective, that does not imply that it is no ministry at all. Let each body credit the other bodies with that sort of a ministry that they have. They are entitled to just this and no more. Let them, on their side, not object to the use of other functions of the ministry in other bodies, and not regard it as a hardship that they are regarded as not having those functions which they do not in fact profess to have.

There are, in fact, in the Church of England and in the Protestant Episcopal Church of this country bishops and clergy whose views of the Christian ministry do not differ in any appreciable degree from those held in the various Protestant churches. There are other bishops and clergy who do not vary in any important particular from the Roman Catholic view. If these can live in harmony in the same Church, why should they make it so hard for those with whom they agree, or at least whom they tolerate, to unite with them?

A frank and searching investigation of the whole question of ordination, especially on its practical side, in an irenic and loving spirit, will remove the greater portion of the difficulties that now beset it.

NEW YORK CITY.

The Next British Prime Minister

BY W. T. STEAD

EDITOR OF THE REVIEW OF REVIEWS

IF Sir Henry Campbell-Bannerman is not Prime Minister after the General Election it will only be because he refuses the position and says to Lord Spencer, "After you!" Even if he did or "C.-B.," as he is more familiarly styled, or "Sir Henry C.-B.," as he is more respectfully designated, has distinctly improved his position. He has spoken with admirable force and excel-

SIR HENRY CAMPBELL-BANNERMAN

say this, it is doubtful whether the refusal would be allowed to stand, for the Liberals have so long fought under the leadership of Sir Henry Campbell-Bannerman in Opposition that they would feel somewhat out of gear if the Liberal leadership were to be transferred to any one else, even if that some one else were the genial, courageous and universally respected Lord Spencer.

Since the session opened Sir Henry,

lent temper on several critical occasions. If he has not exactly acted upon the hint to put a little more of the "methods of barbarism" into his political campaign, he has always been at his post, and he has shown as much good sense and shrewd humor in prosperity as he did in adversity. Prosperity indeed it may be called when he surveys the constituencies from Bute to Brighton and everywhere finds himself acclaimed by

ever swelling majorities as the destined chieftain who is to deliver the Empire from the nightmare of Jingo domination. Not even Mr. Gladstone in 1879 had so assured a prospect of certain victory as that which lies before Sir Henry C.-B. He has borne the burden and heat of the day, and now at the close of the second Jingo Parliament he is enjoying that pleasantest of all enjoyments, the confident anticipation of coming triumph, unmarred by the disappointments which seldom fail to follow close on the heels of political success. Not even his stoutest political opponent would begrudge the veteran campaigner the pleasure of awaiting the harvesting of the fruits of a battle which has already been fought and won.

Even now the immensity of the Tory disaster is but dimly realized by members of the Opposition. They discuss among themselves whether the Liberal majority will be so large as to enable the next Prime Minister to defeat the combined forces of Unionists and Nationalists. To many this seems to be altogether beyond the pale of practical politics. They forget that when landslides occur old landmarks disappear. After the landslide of 1880 the Liberals had a majority of 56 above both the other parties combined. Since then the Nationalists have increased from 62 to 82 in number. To place the Liberal party in a position as strong as that of 1880 they would require forty more seats than those carried by Mr. Gladstone in the floodtide of his Midlothian campaign. But unless the evidence from the by-elections is altogether misleading, Sir Henry C.-B. will have at his back a larger majority of Liberals and Labor members over and above the combined Unionist and Nationalist vote than Mr. Gladstone could boast in 1880.

Intense satisfaction at the prospect of the overwhelming victory—a victory which has already been won in the hearts and minds of the electors, and which only awaits registration at the polls—is naturally mingled in the minds of Sir Henry C.-B. and all his followers with a feeling of pardonable exultation over the smashing blow which is about to be delivered against Mr. Chamberlain and the Jingo horde. At least half of the ecstasy of

the Liberals in 1880 arose from their satisfaction at the crushing catastrophe which overwhelmed Lord Beaconsfield. It seemed like a fulfilling of the prophecies, a foretaste of the millennium, when the great Red Dragon, bound with adamant chains, was being hurled into the abyss. Such a triumph of the justice that is imminent in human affairs seldom occurs twice in a lifetime. It is indeed a joyful thing for mortal eyes to see the second Lucifer of our times hurled from the heights, with hideous ruin and confusion, down, down, down into the nethermost. Nor can even the most censorious critic condemn us for making high melody in our hearts when the fatal Minister, whose hands are stained with innocent blood unjustly shed, and on whose head are heaped high the curses of thousands of women and children done to death in the murder camps of South Africa, meets at last from the hands of his countrymen the nearest approach to the doom of the Tarpeian rock which our milder times afford.

Now, as in 1880, the battle has not been won by the trimmers, but by the stalwarts. All through 1879 Mr. Gladstone was regarded by the majority of London newspaper men as the bane and the ruin of the party, which under the safe and sane and cautious leading of Lord Granville and Lord Hartington was supposed to be outliving the discredit with which Mr. Gladstone had covered it by his Bulgarian atrocity campaign. The *habitués* of London clubs and West End drawing-rooms were of one mind as to the fatuous madness of Mr. Gladstone. He was a sophistical rhetorician inebriated with the exuberance of his own verbosity. He was a *feu furieux*, like Gambetta. He was a political wrecker. His advent to power was equivalent to the ruin of the Empire. So the fools gabbled as is their nature to. The same set of fools gabbled in the same foolish way against Sir Henry C.-B. He also, like Mr. Gladstone, had a human heart that revolted in horror against the wanton cruelties of militant Imperialism trampling liberty to death by the methods of barbarism.

And, like Mr. Gladstone, he spoke his mind with honest wrath and blazing in-

dignation against the atrocities practiced in the name of Empire. The storm of fury that broke loose against Sir Henry C.-B. was the more savage because the men responsible for the acts of barbarism, whereby countries were burned bare by a policy of deliberate devastation, with the lamentable results of death by thousands of innocent non-combatants, were not Chefket Pasha or Achmet Aga, but the British authorities at the seat of war. Nevertheless, Sir Henry C.-B. stuck to his guns with the imperturbable tenacity of Mr. Gladstone. The miscreants who repudiated him, and disgraced themselves by apologizing for these tactics of savagery, now only plead that their treason to humanity and to their leader may be forgotten and forgiven. Forgiven, it may be; forgotten, never. Against each of these renegades stands the ineffaceable record of his faltering in the hour of stress and trial. They wilted in 1900-02, as their predecessors wilted in 1876-78, and altho we may make the best we can of them, and admit them to office, and even to the Cabinet, the knowledge that they failed their leader and their country in the hour of direst need will be remembered against them forever.

Sir Henry C.-B. has led the House of Commons since February, 1899. He stepped into the breach when other men deserted it, and he has done his duty manfully and well under circumstances of great difficulty. When I asked him years ago which text, quotation or proverb had stood him in best stead in the battle of life, he sent me the Pauline saying: "All things are lawful unto me, but all things are not expedient." It was the higher expediency, however, which asserted itself on the famous occasion when he launched his famous barbed phrase about methods of barbarism—a phrase which, altho it was abominably abused at the time by the men who approved of the methods in question, shines out more and more conspicuously against the gloom as the one perfectly just and absolutely truthful word that fell from the lips of Liberal leaders during the whole of the war.

He blamed not the unfortunate instruments of the policy of devastation, who, for the most part, were thoroughly

ashamed of the acts which they were ordered to do, but those responsible for ordering the use of such methods of barbarism. The result of this protest, repeated again and again with splendid persistence and pertinacity, compelled Ministers to modify part of their methods and to deceive the country by denying the rest of the acts of barbarism in which they persisted to the end of the war.

Sir Henry is a very cautious man, a canny Scot, who refrained all through the war from praising the Boers, fearing lest one word of eulogy might lead them to prolong the war, and he took an early opportunity of associating himself with Mr. Morley in repudiating any intention to restore the independence of the devastated Republics. "I have publicly stated that the annexation must, in my opinion, be upheld." But only on condition that our new subjects were admitted to all the rights and privileges of British self-governing colonies, which, as Mr. Chamberlain has reminded us, are independent States, with the recognized right of secession from the Imperial connection. Sir Henry's utterances throughout the war do him the highest credit and do something to redeem our national reputation from the shame and disgrace which submerged the Empire in those evil years.

We can look back upon those troublous times with the composure of men who have crossed the stream and are now safely on the other shore. If Sir Henry's conduct seems open to censure to-day it is because he did not go far enough and protest strongly enough against the war. He, too, was constrained to bow in the House of Rimmon. In obedience to Sir William Harcourt he assented to the hushing up of the inquiry into the Jameson Raid; and in order to assuage the anger of those who denounced his protest against methods of barbarism he voted in favor of £100,000 grant to the General by whose authority those methods were employed. To denounce a General's methods as "barbarous" one day and enthusiastically to vote him £100,000 the day after, without a single word of condemnation for the savagery for which he was responsible, disheartened many of his

stanchest supporters. But even thus qualified the disloyal intrigues of recreant Liberals compelled him to put his back against the wall and speak out in no uncertain fashion. After the malcontents had given such expression to their dissatisfaction that he felt his leadership challenged Sir Henry summoned a meeting of the party at the Reform Club, where he defined his position and defied the mutineers. The result of this emphatic defiance of the enemy in his own camp was that the Jingoës came reluctantly to heel, and afterward Sir Henry never had any reason to complain of the devotion of the rank and file of the party. It is worth while recalling the episode because of the light it throws upon the capacity and determination of the next Prime Minister to keep his seat in the saddle and to hold his own against the enemy without and mutineers within. It is also worth while recalling the fact that in 1899 Sir Henry C.-B. never hesitated one moment in rejecting Mr. Chamberlain's proposal that he should share in the responsibility of sending 10,000 men to the Cape in the midst of the negotiations. "You need not be alarmed," said Mr. Chamberlain. "There will be no fighting. We know these fellows won't fight; we are playing a game of bluff."

"Get thee behind me, Satan!" was in effect the substance of C.-B.'s reply.

Sir Henry is not a first-rate impromptu speaker. Neither is Lord Rosebery. Like Mr. Morley, his best speeches are carefully prepared. When he is Prime Minister the task of replying upon the debate will often be undertaken by Mr. Asquith or Mr. Winston Churchill. But, altho he is given, perhaps, too much to the use of notes, writing "maketh an exact man," and he is never under the temptation to go on and on, exhausting the time and patience of the House. As Mr. Ian Malcolm said of him recently, "He is a man whose soft answer in debate has often turned away wrath; whose unfailing urbanity and cheerful disposition have long since won universal recognition; whose sense of humor never leaves him. He is, above all, a gentleman in the highest sense of the word, whose public differences with friend or foe could never interfere with his private friendships."

Sir Henry Campbell-Bannerman is one year younger than Lord Spencer. He was born in Scotland September 7th, 1836. He was originally only plain Mr. Campbell. But when his maternal uncle, Henry Bannerman, of Hunton Court, Kent, died, he assumed the second name, little dreaming what trouble it would cause journalists in the years to come. There are those who would even declare that the possession of a double-barrelled hyphenated name is amply sufficient to disqualify any man from being the head of a British Ministry. There is one consolation for such grumblers. Like Lord Spencer, the Liberal leader in the Commons is without offspring. There will be no hyphenated inheritor of his name to trouble the press. The knighthood did not come till 1895, twenty-seven years after he first entered the House of Commons. He was educated at Glasgow University and at Trinity College, Cambridge.

He was first elected for the Stirling Burghs in 1868, the year of Liberal victory, and he has held the seat ever since. To have kept a seat against all comers for thirty-seven years is no small tribute to the confidence and esteem which he enjoys among those who know him best.

His first official post was that of Financial Secretary to the War Office, a post which he held from 1871 to 1874. It was in these troublous years that purchase was made by Royal Warrant, and the Army was reformed by Lord Cardwell and Lord Wolseley on the system whose merits had been advertised to the world by the victories of the Germans in 1870-1.

During the period of Liberal eclipse from 1874 to 1880 Sir Henry was a stanch Gladstonian, and when, in 1880, Mr. Gladstone returned to office, he promptly reinstated C.-B. in his former position. These were trying years. The Liberal Government was busy clearing off the bad debts of Lord Beaconsfield in Afghanistan and South Africa, and Sir Henry was kept very busy. In 1882, when the war in Egypt was subjecting the fighting departments to a considerable strain, he was promoted to the Secretaryship of the Admiralty. Two years later, when Sir George Trevelyan's health broke down, he succeeded him as

Irish Secretary. In that capacity he worked under Lord Spencer, and succeeded so well as Irish Secretary that the Irish will be heartily glad to see another Scotchman as Chief Secretary. He went out with his party in 1885. When Mr. Gladstone returned to office in 1886, to bring in his Home Rule Bill, Sir Henry entered the Cabinet as Secretary for War. His chief exploit in that year was not connected with the Army, but with Ireland. He is famous as the author of the phrase which described the process of adopting Home Rule as that of "finding salvation," and he was no less happy in defining the peculiar blend of Orange bigotry and Irish Toryism as "Ulsteria." Sir Henry does not set up to be a professed wit, but his phrases stick better than those of most of his contemporaries.

When Mr. Gladstone was defeated on Home Rule Sir Henry wandered with the rest of the party in the wilderness of Opposition until 1892, when he returned to the War Office, retaining the office after the reconstruction of the Ministry under the Premiership of Lord Rosebery. As War Minister he succeeded in settling matters with the Duke of Cambridge. He was always in the good graces of the late Queen and had the complete confidence of the officers at the head of the Army.

The British Army has always been a great social rather than a great fighting institution, and Sir Henry was too cautious a Scot to lay rash hands on the Ark of the Covenant. The accident that the *coup de grace* so anxiously longed for by Lord Rosebery was administered to the Liberal Government by a snap vote, as to the alleged deficiency of cordite in the

national arsenals, left his reputation as a careful administrator undisturbed. Of course great capital was made out of the alleged shortage of cordite, but the fact that Sir Henry C.-B. had left the army in a good state of fighting efficiency was publicly vouched for by no less eminent authority than Mr. Arthur Balfour.

In 1897 he sat with Sir W. Harcourt on the Hush-up Committee into the Jameson Raid, and unfortunately allowed his judgment to be overridden by the authority of his leader. When Sir W. Harcourt resigned, he was elected leader of the Liberal party in the Commons, somewhat to the surprise of Mr. Asquith, whose friends consoled themselves by thinking that Sir Henry's doctors would not allow him to undertake the post. He had previously refused the Speakership. Sir Henry, however, recovered his health with the celerity with which moribund candidates for the triple crown throw away their crutches after their election, and leader he remains down to this hour.

Sir Henry Campbell-Bannerman will not make a dashing Prime Minister. He is neither a firebrand nor a rocket. He is a good, sensible, level-headed, canny Scot, who commands the confidence of the Radical and Nationalist parties, and is regarded with respect and a certain amount of awe by the Liberal Leaguers. He is a man who combines a wide knowledge of the world with a shrewd eye to the interests of the British Empire. He is no crusader. No one has accused him of fanaticism. He is an honest man, who has no one's ill word; a sound Liberal, a stanch Home Ruler and a deadly hater of all the crimes of the Jingo.

International Conciliation

BY BARON D'ESTOURNELLES DE CONSTANT

[Senator d'Estournelles is one of the leading advocates in France of international arbitration. He is a prominent candidate for the Nobel Peace Prize. He was a member of the French delegation to the famous Hague Peace Conference, has traveled in the United States, and has been for many years a conspicuous member of the French Parliament, first in the Chamber of Deputies and later a member of the Senate. He has already published articles in *THE INDEPENDENT* on subjects connected with peace and arbitration. Americans who wish to join this society, or who are interested in its objects, should write for information to Comité de Conciliation Internationale, 119 rue de la Tour, Paris, France.—EDITOR.]

THIS is the way in which I came to found my Committee for the Defense of National Interests and for International Conciliation.

For twenty years I have been laboring to bring about a spirit of international good will. I love my own country, France, and I would like to serve it usefully and not to help in deceiving the nation with empty words. Now, I have remarked that while France is magnificently endowed as regards climate, soil and inhabitants, she does not seem to know how to make the most of all these advantages. The hygienic arrangements of the cities and towns are, for instance, very bad. While the habits and traditions of the nation contain much that is good, there is much that is bad about them, due to an old, worn out routine. For example, take the most favored part of the population, the rich and well-to-do. They do nothing, but are satisfied to live idly on their income. They are "rentiers," a word that cannot be translated exactly into another tongue; a class of men and women who are simply occupied in spending their revenue. In most other lands a man who respects himself would blush at such an existence. But in France it is a proud distinction to be a "rentier." Once a "rentier" the Frenchman's whole effort is not to do anything to compromise his little fortune, to run no risks and to oppose all change.

When you travel over France you often see the finest rivers unutilized, left to their own care, wild, ungoverned torrents. Not a sou is spent to improve their course or to protect their banks. The money that might be usefully employed in these directions is spent to pro-

tect one's self from foreign trade and foreign war. Thus France is making the mistake of isolating herself and is growing poor, while the surrounding nations are arming themselves to the teeth and surrounding themselves with a chain of frontier custom houses. The natural result of all this bad policy of mutual distrust based on ignorance has been the rapid development of international socialism and the discredit of governmental authority.

In order to remove these dangers, so grave for France and which are found in all countries, I propose a complete change of method and the absolute abandonment of the lines followed up to the present. At present everybody is simply looking out for "No. 1." Under the pretext of protecting himself against dangers from without we are all ruining ourselves at home. So I suggest that in order to improve the home situation in all nations we begin by ameliorating foreign relations. Such is the prime aim of our Committee, whose device is "to stimulate national prosperity among all nations by bettering international relations." *Pro patria per orbis concordiam.*

To bring about this much desired change I count largely on the good example set by the United States. Timid minds see a peril in American activity. I find there a good example, a stimulant, a remedy. Hence it is that I ardently desire that my Committee should count members in all your large cities, in all parts of your wide land—a wish which is being rapidly realized. Such a step is to the best interest of America as well as to the best interest of France and the many

other nations, which cannot lessen their difficulties unless all agree to limit their unproductive burdens and build up in their midst a spirit of order, justice and peace on earth.

Such in a general way is the purpose of this Committee. But as we must begin at the beginning, we shall be careful not to ask for big changes, for radical reforms. Our program is a practical one, based not on sentimentalism, but on the well established interests of each country. The measures to which we will have recourse are very simple and yet efficacious.

Our plan is to bring nations together by first bringing men together. We seek to secure the meeting of private individuals, who without our initiative would never see one another. We hope to start up correspondence between persons of similar tastes, but residing in different lands. All that is necessary to start things on these lines is the grouping together of a few eminent men of different nationalities who are united for this purpose. Then the mass will follow their example, the press will take it up, public opinion will be awakened and the governments will eventually fall into line. Then, by modifying little by little international customs, we will eventually succeed in changing international politics;

we will substitute friendly and legal solutions for those of a violent and warlike nature. In a word, we will acclimate in the world international justice, just as national justice has been slowly but surely built up in each civilized country.

To accomplish this great end we have drawn up a concrete program which can be accepted by all fair-minded men of all nations and which may be thus briefly summed up: We will strive to educate public opinion, to develop arbitration, to correct the misleading telegrams which appear in the newspapers from time to time, to found an international review, to publish tracts and books, to give lectures, etc.; to push the acquiring of modern languages, to bring about an exchange of visits between the members of different Parliaments, to give prizes and scholarships, to send out delegations of artists, workingmen and scientific searchers, to establish centers of information and protection in the various capitals for strangers who arrive from foreign parts, etc., etc.

I may close by giving the names of the distinguished men of the United States who have already joined the Committee and who accept its aims. They are Andrew Carnegie, Nicholas Murray Butler, Seth Low, Simon Newcomb, E. Kelly and Benjamin Trueblood.

PARIS, FRANCE, July, 1905.

At the Grave's Edge

BY HENRY FLETCHER HARRIS

WHAT lands shall greet your gaze?
What winds shall lift your hair?
What mightier stars for you shall blaze,
In what diviner air?

And the long journey through,
Shall Love not have his will?
And the old dream come true,
And the old grief be still?

We reach out empty hands—
We never can forget!
O heart, at last that understands,
Do you remember yet?

ATLANTA, GA.

Literature

Men and Women in Recent Fiction

WE do not actually know the men and women with whom we associate. We only know their outward appearance in action or repose, receive enough conversation views and love glimpses of them to form partial judgments. It is therefore the peculiar business of novelists to make us acquainted with the people we meet in real life. They can produce an illusion of personality with mere words which is more veraciously representative of character than the conduct of the average person is under the lynx-eyed surveillance of his kind, and more fascinating because it is more intimately revealing.

Thus, in real life we should never comprehend the heroine of Mr. Howells' recent novel.¹ To all appearances she is the highly specialized product of an artistic and artificial system of living and thinking. She has too much the symphony effect. There is not a pastel in the art galleries of this new country so exquisitely delicate in manner and suggestion as this word portrait of a young "new" woman who delivers lectures in a Western university upon the virtue of being entirely natural and sincere!"

"Her silvery gray veil misting her gray hat above her hair, sprinkled even at her age with gray, and her gray gloves lying beside her plate, physically, but not spiritually detached from her gray costume. Her intelligent eyes, glancing from her aunt to him and back again to her, had lovely skyey lights in them of the sort that haunt the horizons of passing summer."

Add to this that she could afford "the serenity like that of a September afternoon," and it is easy to see how admirable, mysterious and disconcerting she would be to comprehend in real life. We have Mr. Howells's word for it that she is all for "naturalness," but if so Nature must greatly improve before she can measure standards with her. Nothing

could be more gracefully supernatural than her attitude appears to be toward the incoherent, ignorant, fussing world about her. And we should never know anything of her as a human being but for the fact that Mr. Howells includes the backbiting conversations of her aunt and uncle, betrays her love secrets, and in recording her "inspiration" he offers one of the most cunningly diverting jokes ever perpetrated at the expense of feminine casuistry.

These cobweb interpretations, with humor shining through like the autumnal sun, are becoming more characteristic of Mr. Howells. The only possible objection to the types he portrays is the indolence of his men. It would be a breach of literary etiquette for a man to do a day's work in one of his novels. No more perfect gentlemen were ever bred into life or fiction. They have excellent views upon all subjects, and still more excellent morals. And they should have an easy time living up to them in the vacation existence provided by Mr. Howells. On this account it is difficult to say whether they were moral for moral reasons or because their sensibilities are too refined to endure the indelicacy of an immorality. In any case the snub nosed average reader is introduced and made intimately acquainted with one class of the best people in America, which will probably go a long way toward awakening those finer feelings in him that tend in time toward the development of taller, more aristocratic noses, a feature significant of certain qualities that he greatly needs.

But along with other extravagances of a new and rich country we have more than one class of "the best people." The author may choose from several, and those represented in Anna Robinson Brown's new novel, *The Wine Press*,² differ radically from those portrayed by Mr. Howells. The heroine is the product of a Woman's College, where education is a sort of moral and intellectual surgery by which women are alienated

¹ MISS BELLARD'S INSPIRATION. By W. D. Howells. New York: Harper Brothers. \$1.50.

² THE WINE PRESS. By Anna R. Brown. New York: D. Appleton & Co. \$1.50.

from and rendered independent of men. She is beautiful, sentimental and morbidly bent upon treading her wine press alone. And like others of her class she feels downtrodden by man, suspicious of his most innocent smile, insulted by his very existence, no matter how politely he leaves her to tread and tread alone. She is a simpler type than Mr. Howells' heroine, who is a philosopher, with French heels to her logic. And the reader recognizes in her the old maid version of the most primitive kind of women, those savage, simple creatures who fight against taking a man for a mate. In this evolved type it is a severely intellectual form of coquetry and as unbecoming to a maid as a warrior's helmet.

There are just three books among those mentioned in this review in which the poor average reader would feel "at home." He could meet Alice Hegan Rice's *Sandy*³ upon the grounds of common interest. For Sandy is about as near as a lady can come to interpreting the cross which he represents between a useful citizen and a baseball hero. She has not realized the character so intelligently as she did that of "Mrs. Wiggs" and "Lovey Mary's," but it is near enough the original to entertain every old "Fan" in the country. And while they are out on the edge of town somewhere whooping up the game, if Aunt Ploomie, Leagan Mott, Mrs. Tibbins and Miss Ellaretta could put on their Sunday things and step out of Mary Waller's delightful novel, *Sanna*,⁴ through *The Little Hills*,⁵ in Nancy Huston Banks' new story, and if they could there meet "Mrs. Pottle," "The Widow Wall," "Mrs. Crabtree" and "Miss Arabella," we should have such an exchange of gossip, opinions and homely wisdom as this world never heard before. The first group live in an island village, with men to correspond. The latter live among the little hills in a remote corner of the world, without a sufficient number of men to correspond. This accounts for the difference in the premiums placed

upon masculinity. The prevailing characteristic in them all is a serpent's tooth curiosity concerning one another's affairs, which is healed by a natural tender heartedness. And there exists among them a commendable rivalry in every branch of the culinary art. Never before has there been such cooking and eating in fiction since authors began to serve tea and salads to their fatigued characters. Readers often marvel at the length of time heroes and heroines do without food in the hurried parts of the tale apparently without inconvenience. And of course the author may leave this to be inferred. But there can be no question of the fact that people in fiction do not get enough wholesome food, and this no doubt accounts for their scandalous conduct in many instances. Meanwhile we observe the superior morality in these books, where much time is given to homely eating and drinking. If there be any left among us who wish to have their memories refreshed concerning the cakes of their childhood, or who would recall the clove pink qualities of old fashioned human nature, they should read *Sanna* and *The Little Hills*. Almost any one can think up a tale, but to put in all the feeling, the tender heart logic, that makes people companionable and kin is another business. And it must be done on a sublimated diet of ices and salads.

Men predominate in Western fiction and they belong to that class who go forth with the determination to amass a fortune within six months. But as a rule they are morbidly subjective in their relations to the natural scenery. It overwhelms them so that they sometimes commit murder, or suicide, or chase an attractive girl forty miles over the burning prairie. And the author makes a point of convincing us that it is not the devil which caused them to get drunk and act this way, but a sort of domestic nostalgia produced by loneliness in the midst of so much savage grandeur of mountain peaks or bubbling desert heat—a charitable construction certainly to place upon conduct otherwise so dubious. But Mr. Nason avoids this danger by causing all the people in his new California story⁶ to take a civil engineering

⁴ SANNA. By Mary E. Waller. New York: Harper Bros. \$1.50.

⁵ THE LITTLE HILLS. By Nancy H. Banks. New York: The Macmillan Co. \$1.50.

⁶ THE VISION OF ELIJAH BERR. By Frank L. Nason. Boston: Little, Brown & Co. \$1.50.

view of the scenery. In this way he saves everybody's life and reason except the hero's. He is described as "Praisin' the Lord an' callyhootin' around like a skyrocket with its tail on fire." Conceiving that the plan of a great water reservoir in the mountains had been revealed to him from heaven, he was conscientiously unscrupulous as to ways and means of achieving his ends. Men of this type often become great statesmen in the Church, but to be a visionary and unscrupulous at the same time unfits a man for financial success. Some things cannot be mixed in the business world which are very successfully mixed in certain circles of the religious world.

And besides the people we live with but do not know there are the people we remember. We may never have seen them in real life, but we remember them out of tradition, poetry and history—fair, heroic forms vanishing into the golden meter of the passing years. To this class belong the man and the maid in Mary Austin's *Isidro*,⁷ a story of mission days in old California. They come to us enhanced through the memory of three generations, and they are dearer to the fancy than many characters more rudely modern. Two romances of Southern life during the war period ought to lend color to the conviction abroad that the only people in the South were those of military and antebellum fame whom we remember. For the novelist rarely presents any other from that section. It is doubtful if *Serena*,⁸ her impossible kindred, her revolting slaves and absurd lover ever existed at all; but it is certain that none like them will ever live again. The Federal officers who court Southern women in Charles Egbert Craddock's new story, *The Storm Center*,⁹ are more credible types, and it is the first time in its history that the Civil War has been reduced to a neighborhood affair, but the story of their wooings is the best this author has written in years.

So far we have been dealing with our own kind in our own country, but in *A*

*Dark Lantern*¹⁰ we meet our other kind in England. The scene opens with a line of carriages drawn up before Lady Peterborough's mansion in St. James's Square, and the humble reader is given to understand that royalties are being entertained within (there are as many male royalties oggling innocent heroines in British fiction as there are Confederate colonels strutting through stories of Southern life!) and that it is the German princeling soldier who steals the pretty heroine's heart in this instance. In the second chapter every one adjourns to the terrace about the House of Parliament, and the humble reader stands aside to see the characters introduced to all the famous men in England, not because they are needed in the tale, but the ceremony is inevitable in a first-class English novel; it is a sort of literary obsequiousness paid to a "paternal government." After that the story moves briskly. The princeling soldier having failed to seduce, offers morganatic marriage to Katharine Dereham, and the woman's character is revealed in the pathetic helplessness with which she resists his arguments. She is a good woman deserted by her heart in the fight. With her virtue is not a principle, but a matter of taste and temperament. She is of a quality which requires ideality in love and shrinks from the grossness of mere passion. Her weakness is psychic rather than physical. Thus she does not fall through the princeling's appeal to her senses, but, brought under the hypnotic influence of the man with the dark lantern face, she yields to a questionable relationship. And having solemnly abandoned herself, she recognizes her condition and submits with the calm reticence of a spirit who has lost the power to save herself. The man is an even rarer type. He lacks the clairvoyant sense upon which he plays in others, and staggers fiercely, distrustfully, through every relationship in life. Viewed as a hypnotist there is nothing remarkable in his character, but the impotence of so regnant a spirit to shield himself is a curiously subtle point for an author to make in character drawing and is likely to attract attention.

⁷ ISIDRO. By Mary Austin. New York: Houghton, Mifflin & Co. \$1.50.

⁸ SERENA. By Virginia F. Boyle. New York: A. S. Barnes & Co. \$1.50.

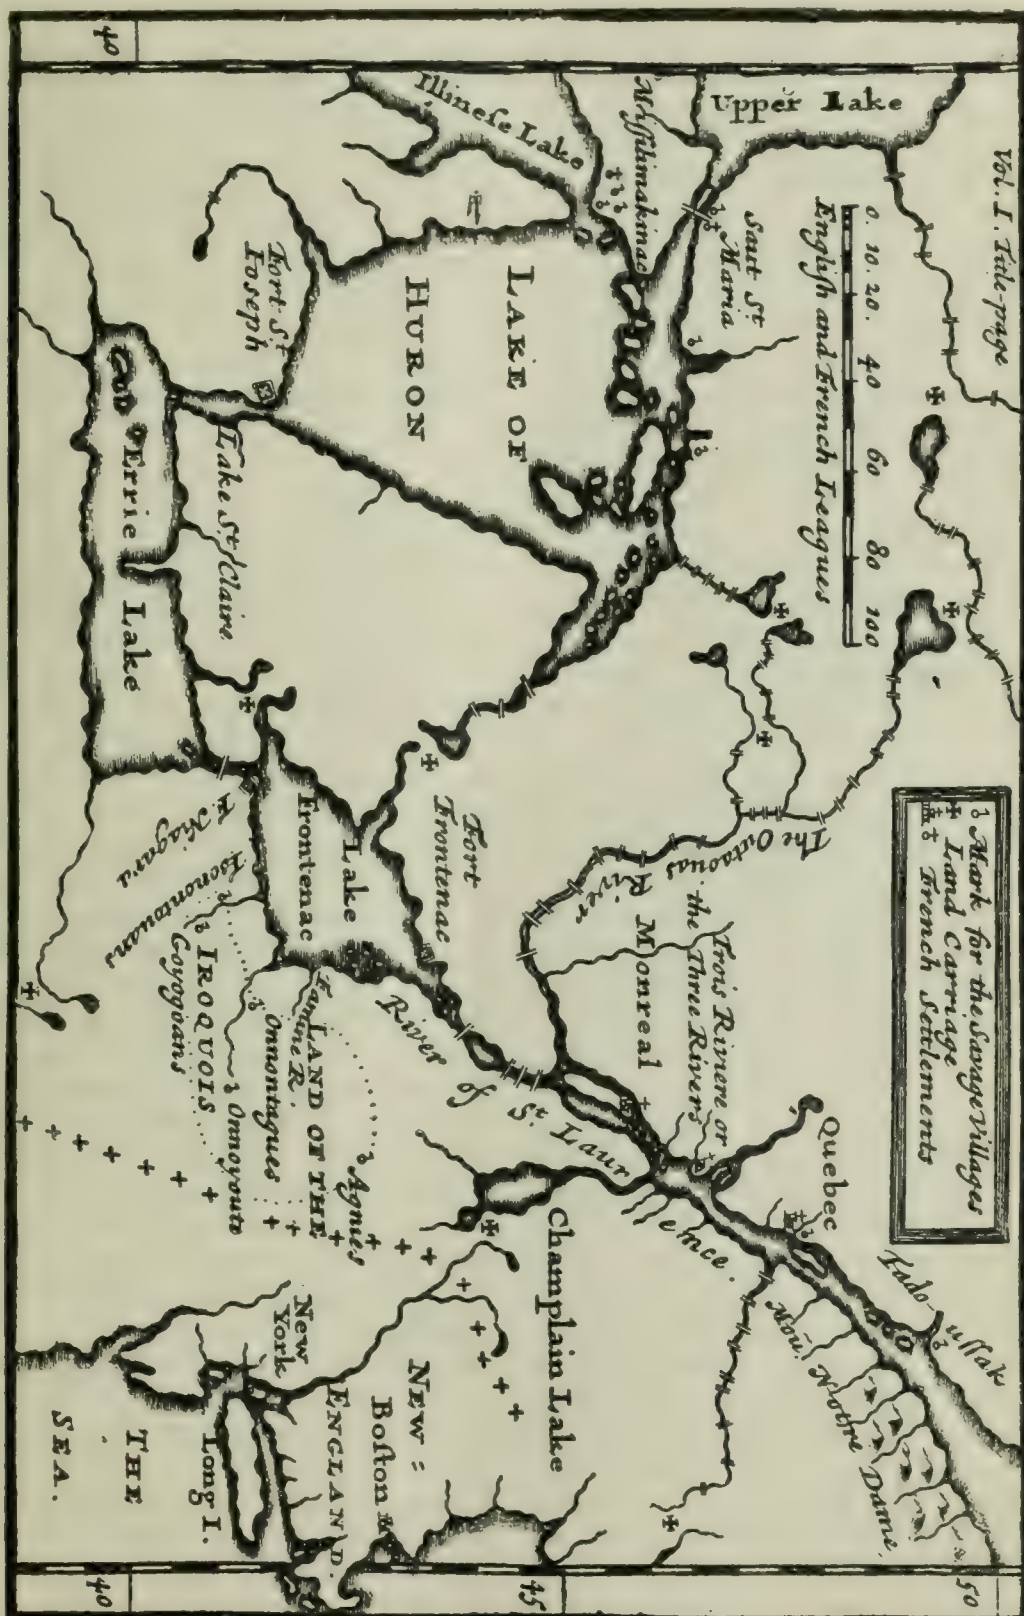

⁹ THE STORM CENTER. By Charles E. Craddock. New York: Macmillan & Co. \$1.50.

¹⁰ THE DARK LANTERN. By Elizabeth Robins. New York: The Macmillan Co. \$1.50.

Lahontan's New Voyages to North America.
 Edited by Reuben Gold Thwaites. Two
 vols. With fac-similes of the original title
 pages and of the 24 maps and illustrations.
 Chicago: A. C. McClurg & Co. \$7.50

Mr. Thwaites adds to his already long
 list of historical reprints this copiously
 annotated and excellently printed issue
 of the 1703 London edition of the Baron
 de Lahontan's *Voyages*. In nearly every

respect the original appearance is re-
 tained; the type is practically identical,
 the crude engravings and the title pages
 are all reproduced, and tho the paging is
 different the original pages are indicated
 by bracketed numbers in the text. La-
 hontan was perhaps the most entertain-
 ing and in some respects the most in-
 structive narrator among all our early

Map from Lahontan's Voyages, 1703. A. C. McClurg & Co.

explorers. We say in some respects only, for he seems to have failed conspicuously on the score of accuracy. He was frequently mistaken and he often exaggerated, to speak mildly. But, for all that, there are a freshness and a vividity about his pages which are sadly lacking in the work of most of the other explorers. He was very much of a modern, moreover, and his satirical treatment of social and political wrongs anticipates much that has been written in a later time. Long before Proudhon, he had decided that "property is robbery," and he praises the savages, particularly the Hurons, in extravagant terms, as a people who do not know the law of *meum* and *tuum*. "I take it a man must be quite blind," he writes, "who does not see that the property of goods . . . is the only source of all the disorders that perplex the European societies." He came to Canada as a boy of 17 in 1683, spent considerable time among the Indians, penetrating the wilderness certainly as far West as the shores of Lake Michigan and possibly as far as the Mississippi. In 1693 he finally returned to Europe. During his absence he had been cheated of his patrimony, and all his efforts to regain it were unavailing. A fugitive from France, he wandered from country to country, finally resting under the patronage of the Elector of Hanover, in whose principality he died, probably in 1715. His *Voyages* for many years enjoyed a wide popularity. They have been well nigh forgotten of late, but the present excellent edition of them will do much to restore them to general favor.

The Coming of Parliament, England, from 1350 to 1660. By L. Cecil Jane. [The Story of the Nations Series.] New York: G. P. Putnam's Sons. Pp xvi, 406. \$1.35.

It is not possible to write of Mr. Jane's addition to the "Story of the Nations" Series otherwise than in terms of disappointment. There are already of this series several excellent volumes dealing with different phases of the political development of Great Britain—volumes which cover these phases in a way that is especially serviceable to the general reader. Miss Emily Lawless's "Ireland" is one of these. Mr. John Mack-

intosh's "Scotland" is another; and, coming to the more recent volumes—for the series is of many years' standing—there are Mr. Edward Jenks's "Parliamentary England," and Miss Bateson's "Medieval England." When Mr. Jane's *The Coming of Parliament* was announced we looked for a book that might well serve as a companion volume for Mr. Jenks's monograph—one that in order of sequence should come in between Miss Bateson's "Medieval England" and Mr. Jenks's "Parliamentary England." It may be that the editor of the series and Mr. Jane also had something like this in mind when *The Coming of Parliament* was determined upon as the title of Mr. Jane's book. But in this instance the title is not descriptive of the work; for instead of a volume treating specially of the growth of Parliament as an institution, Mr. Jane has once more gone over ground that has been adequately covered by many previous writers on English history of long acknowledged standing, and has given us a general survey of English, Scotch and Irish history—political, religious, social and industrial—between the Black Death of 1350 and the Restoration of Charles II. There are some references to Parliament in Mr. Jane's survey of these three hundred years. They are, however, not nearly so full, detailed and continuous as to warrant the title which he has given to his volume; while some of the statements that he makes with regard to Parliament tend to the conclusion that a volume in which Parliament was to have foremost attention—such attention as the title demands—was not continuously in mind when he was busy with his research. As an appendix to Mr. Jenks's "Parliamentary England" there is a list of forty-five or fifty authorities on which the work is based. Mr. Jane furnishes no such list; absolutely no clue anywhere to his authorities. But it is obvious from the text that Mr. Jane has broken no new ground in the research for the Parliamentary side of his book; and from mistakes into which he has slipped he has not always, it is clear, made very careful use of the old and well known authorities as to the history of Parliamentary development.

A Peculiar People, the Doukhobors. By Aylmer Maude. New York: Funk & Wagnalls Co.

If Mr. Maude had simply intended to give a history of the Doukhobors, with the story of their migration to Canada in 1899, it would have been well if he had entirely rewritten his book. The disconnectedness and lack of sequence in his chapters, some of which were written before the migration, and the large amount of irrelevant matter make the book something of a conundrum to the reader until he reaches the final chapter. Then he finds that Mr. Maude's primary object is to make amends and do public penance for the offense of which he accuses himself, of having set the Doukhobors in entirely too good a light before their migration from Russia, thereby misleading the public and the Canadian Government into assisting and welcoming the Doukhobors, who afterward, by their deceit and distrust, and by the fanaticism displayed in their pilgrimages, were the occasion of much trouble and disappointment. A more consecutive story both of the sect and of the migration would have been more comprehensible and interesting to the general reader, but the volume, as it stands, brings out well the virtues and the limitations of this brave and in many respects most estimable people; while we are shown at the same time the limitations which are imposed by ignorance and credulity, and the impossibility of expecting enlightened conduct and freedom from gross superstition in a people long crushed by persecution and arbitrary government, and absolutely without education. The tendency of such a people—a people deeply religious, but without any clearly reasoned grounds for their beliefs—to throw themselves abjectly under the feet of any strong and capable man who can make himself their leader is a tendency common to all mankind; but the dogged persistence and sullen unsubduable will-power of the Russian character makes it more remarkable in the Doukhobors than in other sects. The capacity for unlimited and unquestioned obedience to a leader whom they have once thoroughly acknowledged is not without its advantages, as is shown by the quiet way in

which the Doukhobors have settled down and dropped their extravagances now that Verigin, their leader, who at the time of their migration was in exile in Siberia, is among them. As for the future of the Doukhobors, there is but one solution—education. With all the virtues they undoubtedly possess, if they can also have their intellect and reasoning powers cultivated and can be made to take wider and better balanced views of the world there is every reason to think that they will prove a very acceptable addition to the population of the Dominion.

The Diseases of Society. (The Vice and Crime Problem.) By G. Frank Lydston, M.D. Philadelphia: J. B. Lippincott Co. \$3.00.

Perhaps there is no more encouraging feature in our present day sociology than the interest of physicians in moral as well as in physical diseases. They are in a position to see what is pathological in the physical basis of vice and crime, and consequently to help materially in the formation of a healthy public opinion as to the view that shall be taken of what used to be considered simply the result of human malice. The hope of amelioration in present conditions consists in the development of that larger charity which does not really condemn, but sympathizes, for it is only sympathy that ever does any good in the solution of human problems. Unfortunately, tho Dr. Lydston's opportunities for observation have been manifold and have been well taken advantage of, his book is not likely to have that influence for good it would surely have but for certain defects in the writing of it. It has not the air of a serious book of science, and indeed contains here and there a misplaced facetiousness that is apt to disturb the serious reader, tho it may tickle the ear of the groundling. The chapters on Social Pathology, on the Etiology of Social Diseases in general, on Neuroses in their Relations to Social Diseases and on Sexual Vice and Crime are the most interesting. They contain besides what is best in the author's personal experience without the repetitions which lessen the effectiveness of other parts of the book. Dr. Lydston is apt to

attribute too much to criminal tendencies and to the physical and psychic characteristics of the criminal as influencing his career. In these later years criminology has lost much of its prestige because of the exaggerated claims of devotees. It is not so surprising to find that in his therapeutics of social disease something of this same exaggeration should be manifest. While the author condemns capital punishment, he does not hesitate to suggest even asexualization and sterilization to prevent the breeding of criminals. While the book is sure to be useful to those interested in the subject, it could have been made briefer without losing in value, and would thus have gained in force.

The Life of Thomas Hart Benton. By William M. Meigs. Philadelphia: J. B. Lippincott Co. \$2.00.

The True Henry Clay. By Joseph M. Rogers. Philadelphia: J. B. Lippincott Co. \$2.00.

Mr. Rogers fears that the Henry Clay who prevails in the popular imagination is but as a ghost, and not "the full-blooded, true-hearted, impulsive, chivalrous, imperious Kentuckian." He accordingly sets himself the task of riddling certain fallacies regarding his hero and in a series of rather impressionistic sketches pictures him in his various aspects as statesman, patriot and country gentleman. The work is an attractive piece of writing, full of color and life, and giving much of the atmosphere of the ante-bellum days. The form in which it is arranged, however, makes inevitable a great many repetitions, and clouds somewhat the figure of the personality whom he essays to draw. The connected narrative form would have left on the reader's mind a clearer picture. There is an occasional slip of misstatement, as, for instance, when Calhoun is spoken of as a man without wife and child; but on the whole a painstaking care is evident. Mr. Meig's *Benton* has a more logical order and a more detailed treatment of particulars, tho it lacks something of the vivacity of the former work. It is a highly praiseworthy study of the great Missourian, sincere, thorough and judicial, and it presents a picture not likely to be forgotten. The tragedy of Ben-

ton's later days is strongly depicted. Refusing for years to see the "irrepressible conflict" which Seward in the North and Calhoun in the South had proclaimed, stanchly supporting the Union and regarding the Southern fomentors of disunion as the plotters of a criminal conspiracy, he gradually lost his old following in his State and went down, fighting desperately, to defeat and retirement. His last days were clouded and embittered with the dread of the evil times soon to come, but he kept to one consolation, "the knowledge of the fact that he had labored in his day and generation to preserve and perpetuate the blessings of that Union and self-government which wise and good men gave us."

The Bible: Its Origin and Nature. Seven Lectures delivered before Lake Forest College on the Foundation of the late William Bross. By the Rev. Marcus Dods, D.D. New York: Charles Scribner's Sons. \$1.00.

The name of Marcus Dods is a guarantee of painstaking Biblical scholarship, cordial attitude toward criticism, careful weighing of critical results, and frank and honest avowal of opinion. He is not an original investigator in New Testament science, but he is familiar with the latest investigations of the best scholars, and he applies sound, sane judgment to their conclusions, and states his own opinions with clearness and force. In his Bross Lectures at Lake Forest he considered such questions as these: How does the Bible compare with other sacred books? How did it come to be made up of the particular books which now compose it? In what sense is it inspired? Is it without error and can it be said to be infallible? Dr. Dods brings out with much force the general trustworthiness of the Bible, especially of the Gospels, tho he insists that it is not verbally inspired nor inerrant. He maintains that criticism is inevitable, and describes the higher critics as a "highly trained corps of scouts and skirmishers thrown out on all sides to ascertain in what direction it is safe and possible for the Church to advance." His work will be of service in disarming prejudice and allaying fears as to the critical study of the Bible.

The Church and Its Organization in Primitive and Catholic Times: An Interpretation of Rudolph Sohm's Kirchenrecht. By Walter Lowrie, M.A. New York: Longmans, Green & Co. \$3.50.

Prof. Rudolph Sohm's *Kirchenrecht* (Ecclesiastical Law) is by far the most important contribution to the subject of the organization and institutions of the early Church that has been made in recent years. On its appearance in 1892 it was at once recognized as an epoch-making work in the discussion of the nature and constitution of the early Church, and all recent writing on the Christian ministry and the order and usages of early Christianity has taken the form of criticism and discussion of the conclusions reached by Sohm. Prof. Edward C. Moore published last year a brief but able abstract of the views of Sohm in his book on "The New Testament and the Christian Church," but the work of Mr. Lowrie is the first adequate exposition of the argument of the Leipzig professor that has appeared in English. It is a work which no one who is interested in the question of early Church organization, or the deeper question of the nature of the Church as a religious society, can afford to neglect. It refutes the assertions one often hears that the Jewish synagogue or the Greek guilds furnished the model of Apostolic Church organization, and maintains that "this organization was the unique and spontaneous creation of the Christian faith." The main thesis is that the New Testament idea of an *Ecclesia* was not of an organization of any sort, either local or general, but a spiritual fellowship; that the *Ecclesia* as a whole is incapable of organization, and a legal constitution is opposed to the nature of the Church; that when the notion of ecclesiastical law was introduced Christianity was transformed into Catholicism. This is not a presentation of any form of Church government, whether new or old, as Apostolic and authoritative, but it strikes the ground from beneath the very conception of an authoritative form of Church government. Mr. Lowrie's study of early ecclesiastical institutions will afford small comfort to any Christian denomination which desires to find its own peculiar constitution in the Apostolic churches. But to those who would know

accurately what were the beginnings of church government and discipline this work offers larger instruction than has been given in English since the publications of Lightfoot and Hatch, and to those interested in the vital question as to what the Church of Jesus was when the spirit and life of its Founder were fresh in the memory it furnishes a new and suggestive point of view.

American Literary Criticism. Selected and edited, with an Introductory Essay, by William Morton Payne, LL.D., Associate Editor of "The Dial." New York: Longmans, Green & Co. \$1.40.

Dr. Payne's choice of critics and of critical work is admirable, and his characterization of our American contribution to criticism is, on the whole, exceptionally good. There was never any great difficulty with criticism in America, either as to quantity or quality. It has always been abundant and free and an eye-opener. How much it has been this last Dr. Payne most ingeniously shows in his selections. A line of critics surely not to be despised for scholarship, insight, truth and taste is that which includes Richard H. Dana, who gave us the best ocean realism that has ever been written; George Ripley, so broad in the brows that he never could wear comfortably any of the doctors' hats, whether of the pulpit or of the college; Ralph Waldo Emerson, who, both as a destructive and a constructive critic, has been felt on all the continents; Poe, narrow in his range, but marvelous in touch and ear for the music of words; Margaret Fuller Ossoli, leader of the long succession of women who sit on thrones, with roses in their hair and a roll of manuscript in the right hand; James Russell Lowell, the prince of essayists and critics, who always sits above the salt at continental tables; Walt Whitman, with his "barbarian yawp," who stalks at the head of the crowd who break heads of saints and sinners alike; Edwin Percy Whipple, who every time Boston gave thanks that she was not as other folks sat at the head of the table of criticism and handled the knife with much dexterity as to the nicer parts of the American bird; Sidney Lanier, now resting in his Southern grave; Edmund

Clarence Stedman, very much alive and most keen of critical eyesight; Howells and James, who sit at the international feast as carvers, executing a preliminary flourish on the steel before they strike into the homely joints of the old-fashioned fowl. What a roll of honor it is! Not to be rated below any company of names abroad. And, altho all of them were born before the magical year "1850," probably not a man of them would be willing to be counted out of the number of those who claim, with Dr. Payne, that criticism realizes that it must "account for" literary productions as well as deal with "the analysis, exposition and judgment" of them. They would all agree, probably, "that it must do what it can to explain the conditions under which a work is produced"—whatever that may mean—and show, if it can, "how it has been molded by the form and pressure of the time and place in which it has appeared," altho that is a large job, "and seek also to bring it into its proper historical relations with what has gone before," and they would, every man of them—even Edgar Allan Poe—have said so in good English of the Darwinian formula, if only Darwin had produced the formula a little earlier in the nineteenth century.

The Truants. By A. F. W. Mason. New York: Harper & Bros. \$1.50.

"The Four Feathers," a novel by Mr. Mason which appeared two years ago, was far superior to this new story. The same idea of cowardice which made that book so famous is again advanced, but not so effectively. And in common with many English novelists he writes in a prosaic manner of the most romantic passions. This lack of animation will render *The Truants* almost droll to American readers. He portrays the most sentimental situations as if he were reporting a speech in Parliament.

Crux Aetatis. By Martin Schutze. Boston: Richard G. Badger.

The volume entitled *Crux Aetatis*, by Martin Schutze, is a short one, remarkably well printed and bound. The contents are meditative, irregular, but al-

ways with artistic quality and intelligence; faint, freakish, half mythical verse, suggestive of Whitman if of any one, suggestive more of later volumes from Schutze, where he will sing in richer, clearer note that he has here. For there is a feeling along with the musical disappointment that this subtlety of blended vision will not be lost. One reads the poems over again to sound them, then once again to sense them and consider. To quote one would best explain the problem:

"Through the sober window
The wooded Autumn hillside peers,
Silent in the silver-purple rain-mist,
Dim as golden treasures
That have slept a thousand years
In the deepest depths of the sea.

"And a moment we wonder,
And breathless gaze
At the buried golden treasures
That have slumbered in dim sea depths
A thousand years,
Strange as the many-figured curtain
Which folds the ultimate secret of things.

"And we turn again
To our cabined ease.
We ripen, and fall, and turn to mold
As the fluttering leaf.
We pass as the blind gray clouds overhead.

"And within us, unheeded,
A golden treasure slumbers a thousand years
Dim as the deepest depths of the sea,
Sombre with the secret of things."

The Mormon Menace. Confessions of John D. Lee, Danite. Introduction by Alfred Henry Lewis. New York: Home Protective Publishing Co.

"The Confessions of John D. Lee," made during his imprisonment, before his execution by troops of the United States, are widely known and of real value to the student of Mormon history. The Home Publishing Company has rendered valuable service by sending them forth in this well executed volume. The title of this reprint is unfortunate. There is no Mormon menace at the present time and there never was a Mormon menace except in feverish imaginations. Mormon religion has never been popular. Its missionaries, who have been numerous considering the size and re-

sources of the Mormon community, have gained converts only by the hardest labor. If any other religion had been prosecuted with half the zeal and devotion displayed by Mormon missionaries it would almost certainly have become formidable. But after seventy-five years of almost unparalleled exertion the Mormons are still a feeble community, and their prospects appear to be hopeless. Mormonism is a Protestant development. The Church has employed the most laborious exertions in Catholic countries without success. By the conditions of the case they are compelled to proselytize among the Protestants. But even among Protestants their success has been very slight. Mormonism appears doomed to "innocuous desuetude." It seems to have owed much of the small progress it has made to the persecutions that have been bestowed upon it. But of late years persecution has begun to decline, and along with it is declining the fanatical enthusiasm which persecution always awakens. The Mormons are gradually settling down into quiet citizenship. It is likely that in the course of time they will be regarded with something like the sentiments with which the Mennonites are now looked upon by the people of Holland. The tide of Western immigration, which is ever swelling to higher proportions, promises in due time to overflow the State of Utah, and then the Mormons will find themselves in a hopeless minority. Meanwhile the American people are striving to keep their temper and their dignity, and they are succeeding admirably well. Therefore the Mormon problem seems to be in a process of satisfactory solution.

Manual of the Trees of North America (Exclusive of Mexico). By Charles Sprague Sargent. With 644 illustrations from drawings by Charles Edward Faxon. 8vo, pp. xxiii, 826. Boston: Houghton, Mifflin & Co. \$6 00.

Mr. Sargent is the author of "The Silva of North America" and Director of the Arnold Arboretum of Harvard University. There is no better authority living on the subject of this volume. It contains 644 drawings, generally half size, of 644 different kinds of trees (ex-

clusive of shrubs, which will probably go to another volume). This is a purely scientific manual, very exact, such as a botanist wants, with no surplusage of literary padding, no such words as *grand*, *beautiful*. But it contains all the needed helps, the analytic keys and table of definitions which the student needs. Britton and Brown have taught us that a general manual of botany must have a figure for every single plant, and these very exact and careful drawings by so accomplished a botanical artist as Mr. Faxon are admirable and ample. The botanist who is not familiar with Mr. Sargent's "Silva" will be surprised at the number of scientific names of trees that are credited to "Sarg." His specialty is the haw, or *Cratægus*. Out of 132 species recognized by Mr. Sargent 64 carry his names. This does not mean that they are new species, for not many of them are, but that he has found it necessary to rename a very large number. Only eight carry his names among the 47 oaks. We wish the volume were not so expensive, but it must have a limited circulation. It will be especially valuable to students in the West and South, where the trees are not so well covered by other manuals.

How to Write. A Handbook based on the English Bible. By Charles Sears Baldwin, Assistant Professor of Rhetoric in Yale University. New York: The Macmillan Co. 50 cents.

It is a commonplace of literature that many of our greatest writers have found their style in the English Bible, but such a direct use of it for teaching composition as is done in this little book is novel and ingenious. As examples of "How to Prepare a Speech" the speeches of Paul at Mars' Hill, to the Jews of Antioch and at the trial before Felix are given and analyzed. For essays we have selections from the Wisdom of Solomon and from Paul and Isaiah, while "How to Tell a Story" and "How to Describe" are illustrated from the Old Testament. The book will be very useful as a practical rhetoric and is likely to do more to restore the Bible to its rightful place in modern education than any num-

ber of magazine articles and chapel addresses on the literary value of the Bible.

Mine and Thine. By Florence Earle Coates. Boston: Houghton, Mifflin & Co. \$1.25.

Miss Coates's verses may be described in a general way as topical. She has a trick of catching up all sorts of little incidents into her mind and turning little tunes to them. So Mr. Stedman and Dreyfuss and Edward VII and Miss Keller and many more furnish her with a variety of points of attachment and themes of general interest. Nor is the following sonnet, which will serve as an example of her "art," without a certain admonitory timeliness:

TO POVERTY.

"Pale priestess of a fane discredited,
Whose votaries to-day are few or none;
Goddess austere, whose touch the vulgar
shun,
As they would shrink from a Procrustes' bed,
Hieing to temples where the feast is spread,
And life laughs loudly, and the smooth
wines run;
Wise mother!—least desired 'neath the sun,
At thy chill breasts the noblest have been fed.

"Great are thy counsels for the brave and
strong;
Yet do we fear thy brooding mystery,
The griefs, the hardships, which about thee
throng,
The scanty garners where thy harvests be;
But seeing what unto the rich belong,
We know our debt, O Poverty, to thee!"

A New Paolo and Francesca. By Annie L. Holdsworth. New York: John Lane. \$1.50.

The course of true love would run more smoothly in fiction if it were not the romantic fashion for the dying party to bind the hero or heroine by some vow impossible to keep. This story, which begins cheerfully, ends in a morbid agony, because the young woman in it is bound by a deathbed promise to marry a certain man. Naturally she prefers the other one. If our readers are interested in this time honored situation, let them buy the book and finish the tale. It is well told, and the author has enough coloring matter in her vocabulary to paint the national history of a whole continent.

Pebbles

Morton, Loomis, Heilprecht: "Who's the next gentleman to be whitewashed? Hooker?" —*Puck*.

.... "This is a grave mistake," sobbed the man when he found he had been weeping over the wrong tombstone.—*Columbia Jester*.

.... *Excited Father:* "What are we going to do? These scales only weigh ten pounds and the baby weighs more than that." *Calm Brother:* "You might chop off one leg and weigh that separately."—*Somerville Journal*.

VACATION.

Now sister, home from boarding school,
Severely criticises ma;
And, with an air of wisdom rare,
Explains the grammar's rules to pa.
—*Harvard Lampoon*.

A gent called "Six-Shooter" O'Connor
Had curious notions of honor.
He embezzled the mare
Of "Four-Flusher" O'Hare,
And proceeded straightway to Mont.

But, alas for the horse-stealing biz;
Since the mare that he rode was not his.
So, despite all excuse,
They adjusted the noose,
And they urged him to rise—he Ariz.
—*Harvard Lampoon*.

THE YACHTMAN'S HAND BOOK.

Rule I—When engaging a sailing master be sure to refer to your boat as "the stanchest little vessel that plows the briny main." This will impress him with your seamanship.

II—Do not call the cook a galley slave until the end of the trip or it may cause indigestion.

III—When half seas over it is a good plan to go off on another tack. Great care should be taken to avoid bars at such a juncture.

IV—Sporting rules require that gloves weighing at least five ounces be used in boxing the compass.

V—Under the new ruling of the S. P. C. A. the watch dog cannot be compelled to stand the dog watch. Use any old sea dog.

VI—If you find that your provisions are tough you may eat the tender.

VII—If you are unable to hear the soundings ask a sailor to fathom their meaning.

VIII—To avoid comment it is best always to start with a fresh new deck.

IX—If your boat happens to be a catboat great care should be taken to avoid schools of dogfish.

X—It is best to dress modestly, as a heavy swell is liable to be dangerous to a small boat.
—*Princeton Tiger*.

Editorials

Life Insurance Reform

GOVERNOR HIGGINS has yielded to the pressure of public opinion, and there is to be a legislative investigation of the life insurance business in New York. But, with a curious disregard for the words of his own message to the Legislature, he declares that he still believes "there is nothing to be gained" by such an inquiry.

In that message he asserts that the insurance laws of the State are "obsolescent and inadequate"; that a revision of them is "necessary" and should be promptly made; that the Insurance Superintendent's inquisitorial powers are so limited that he desires the aid of a legislative investigation. The management of life insurance funds, he continues, is not sufficiently safeguarded. Under the inadequate existing laws earnings can be diverted to improper uses, and trustees can speculate with the trust funds "for their personal advantage." The State, in the performance of its duty to policy holders, must "restrict investments," limit salaries, hold trustees "to a stricter accountability" and give policyholders "a more effective share in the government of the companies":

"It may well be that the harsh and arbitrary remedy of dissolution and receivership should be made not only a penalty for insolvency, but also a summary check upon a solvent company when it becomes irredeemably the plaything of lawless greed. The State cannot permit the subjects of its supervision to exist as licensed prodigals of other people's money without becoming an accomplice to the offense."

And after saying all this and much more to the Legislature, Governor Higgins is "still of the opinion that there is nothing to be gained by a legislative investigation" designed to promote a needed amendment of the statutes. He should find time to read the message which was sent to the Legislature over his name.

For a long time we have urged the importance of providing for a legislative

investigation of the Equitable scandal. New laws are imperatively demanded by the conditions and the abuses which have been disclosed; and the enactment of them should be preceded by such an inquiry as is now to be made. It is right that other companies, as well as the Equitable, should be subjects of investigation. The life insurance business, as it is conducted in New York, where so great a part of it is carried on, is now on trial, and public confidence in the management and methods of it should be fully restored. It is within the power of this committee, of the Legislature, and of the prosecuting officers of the State and the city, so to restore it. Among the members of the committee there may be unworthy men, but their presence will not prevent a thorough inquiry, or withhold from the public those facts which the inquiry must reveal. The committee will continually be exposed to the pressure of public opinion, by which it will be kept in the right path.

It has a great opportunity, for its recommendations, if they meet the demands of the situation, will be memorable and even revolutionary in their effect upon the life insurance business in the United States. The Equitable should first engage its attention. Every dollar of that company's receipts and expenditures should be traced and accounted for. Witnesses whom Superintendent Hendricks could not or did not examine can be brought before the committee. Facts thus obtained may assist Attorney-General Mayer and District Attorney Jerome, but it will be primarily for the protection of policyholders and to acquire information that shall point the way to new laws that the committee will search for them.

Complete mutualization the Equitable needs most, mutualization with "elimination of the stock," as Superintendent Hendricks said in his report, and with "elimination of Wall Street control." How is this to be accomplished? There must be legislation. The company's

charter must be amended. Mr. Ryan has agreed to sell his stock at the price he paid for it. With minority shares included, this would mean about \$5,000,000 for the entire issue. Ought the company, the policyholders, to pay such a price? Could the owners of the stock be compelled to sell for less?

These are some of the questions which must be answered in the committee's report. At all events, the stock must be eliminated, and the policyholders must have absolute control. With the stock both Mr. Ryan and Mr. Morton should also be eliminated. We are not criticising their action or saying that it has not tended temporarily to improve the situation. But their continued connection with the company would not be in harmony with those ideal conditions which the policyholders desire and which the committee should seek to establish.

When the committee turns from the complete mutualization of the Equitable and from the legislation without which that change cannot be made, to other remedies which the conditions demand, it will find that these need to be applied to the entire life insurance business in New York, if not, indeed, to this business elsewhere as well. Such abuses as have been disclosed in the Equitable—syndicate promotion by means of insurance funds, trading in securities at the company's expense, profitable speculation in banks and trust companies upon a basis of insurance money, lavish extravagance, the payment of excessive salaries, etc.—should be prevented in all companies by legislation and by the restrictions of efficient supervision. We are not saying that such offenses have been committed in other companies. But it should not be possible in any life insurance company to do any of these things with impunity. They should be distinctly forbidden by law, and should also be prevented by the restrictions of State supervision. And certain conditions which offer temptation should be eliminated.

The investments of a life insurance company should be restricted and guarded by law as carefully as those of a savings bank. We believe that the committee should recommend legislation—and that it should be promptly enacted—applying to life insurance companies'

funds the same rules that now govern the investment of savings bank deposits. In other respects also a life insurance company should be required to conform to the rule for savings banks. It should not be permitted to control, or to be connected with, subsidiary institutions, such as banks and trust companies, or other corporations, but should be confined by law strictly to the business of life insurance in its various forms.

By the issue of deferred dividend policies there is heaped up a huge surplus which attracts promoters and speculators and continually offers temptation to those in whose charge it lies. Here may be seen the source of many of the abuses to which attention has recently been directed. While the use of such policies thus affects the company's treasury and may lead trustees and executive officers astray, it is also objectionable because it introduces into the business something which resembles gambling. The committee should carefully consider the question whether the issue of deferred dividend policies ought not to be by law forbidden or kept within narrow limits.

These are the most important reforms which will inevitably be suggested to this committee, whose report, we trust, with the legislation thereafter based upon it, will impose upon these great fiduciary institutions a wholesome restraint. The Legislature of New York should be foremost in the work of guarding the money of the insured, of keeping it out of the hands of speculators and of preventing the use of it for projects distinctly opposed to the people's interests. If such protection is refused where the life insurance business has been concentrated and has become so great, a popular demand will arise for strict national supervision or even for insurance by the Federal Government.

Graft and Public Ownership

ULTRA-CONSERVATIVES who see "danger" in every proposition of public ownership are fond of magnifying the opportunity which would be created for corruption if railways, telegraphs, electric lighting systems and so on should become public enterprises. They point to scandals in the Post Office Depart-

ment, irregularities in army and navy supply contracts and leakages of crop reports as proofs of the impossibility of conducting public business in an honest way and as samples of the wrongdoing on a big scale that we might expect if the business responsibilities of public departments should be increased. Such probabilities of financial irregularity, added to the certainty that a vast enlargement of the civil service would create new political difficulties, seem to many minds a conclusive demonstration that an extensive transfer of important business interests from private to public control would be a policy of folly.

Do these defenders of the existing order ever take the trouble to inform themselves upon the relation between the private ownership of public service enterprises and graft? The shrewd French economist, Bastiat, used to say a good deal about the "unseen things" in economic phenomena. Like the tyro at chess, the tyro in economics sees a few of the possible moves on the boards so plainly that he is totally unaware of other moves that perhaps are far more important. The opponents of public ownership are obstinate examples of inability to see the really dominant facts of political and economic life. Peculation in public office, the spoils system and the betrayal of trust are but minor evils when compared with the greater corruption that is engendered by the existing relations of private corporations to legislation.

All public service corporations are solicitors of public favor. They must have franchises, to secure which they must by one or another means control legislative bodies and administrative departments. The means employed usually include inducements more effective than an appeal to the intelligence and fair mindedness of the legislator or the administrative officer. Bribe money, paid over without concealment, or paid under the disguise of a contract, is one of the necessary expenditures in public service finance. We venture to say that no public service corporation in the United States would dare to publish an absolutely truthful financial statement showing the exact nature of all its disbursements throughout its whole history. Corporation statements are wonderful examples of the art of discreet itemizing.

One result is that every legislature and other franchise granting body has become a systematic and shameless grafter. And it does not confine its enterprise to extorting "what the traffic will bear" when corporations call for favors. All legislative bodies have learned how to bleed the corporations without waiting until benefits are asked. Strike bills or resolutions are introduced for the understood purpose of compelling involuntary payment. Some annoying restriction is proposed or an increase of taxation is threatened. The cheapest and easiest thing the corporation can do is to step up to the political captain's desk and settle.

Now if any one honestly supposes that this system of graft is not a far bigger tax upon the public and a far more demoralizing force than the official malfeasance that develops in Governmental departments, he is an innocent. It has become the dominant factor in American business and political life. The fertility of our land, the native richness of our mines, the ingenuity and enterprise of our people, the tradition of self-government—not one of these things compares in importance as a fact to which every other business fact must somehow be adjusted with the partnership between the corporations and the politicians which yields to the latter a substantial "rake-off."

To press then the argument that public ownership means leakage, waste and corruption is either imbecile or disingenuous. It strains at the gnat and swallows the camel.

It may be quite true that private business management is more efficient and less wasteful than public management. It may be quite true that public business methods are bound with red tape and that they are unbusinesslike. It may be that the balance sheet of any conceivable business would show a larger profit under private than under public administration. But what of it? Why do we tacitly make or unquestioningly allow the assumption that the superior profitability of private management is a final retort to the argument for public management? When public interests are at stake it is not the absolute, but the relative, economy of one or another form that becomes a public concern. The question is not, Under which plan does

a group of privileged persons secure the greater advantage? but it is, Under which plan does the greater advantage accrue to the public? It may be that under private management a railroad can be run so that one hundred dollars comes in for every eighty dollars paid out, and that under public management ninety dollars would be paid out for every hundred dollars that comes in. What reason is that for continuing the private management if out of the twenty dollars profit the public gets fifty cents, while under the public management out of ten dollars profit it would get ten dollars?

This is a question that the opponents of the public ownership of public service enterprises have never squarely answered. They never will answer it, and for an all-sufficient reason—namely, All men divide themselves into two classes, according to their real view of social relations. Consciously or unconsciously, frankly or shamefacedly, one class of men believes that the poor, the inefficient, the mediocre human beings exist and ought to exist for the benefit of their betters. The other class of men believes that human society ought to be an arrangement in which each exists for all and all exist for each. The men that believe in privilege and in a privileged class instinctively object to any extension of public enterprise which is “uneconomical” in the sense of depriving the privileged of money-making opportunities, altho the public is benefited, or in the sense of increasing somewhat the sum total of official misconduct, altho curtailing privately managed graft.

Patriotic Relics

If Commodore John Paul Jones had taken the precaution to have had Shakespeare's curse inscribed on his tomb it would have been better for him, for it seems that in our effort to do honor to his remains we dishonor his name. In our last issue Mr. Park Benjamin calls attention to the fact that Jones himself says he was wounded, whereas the most minute examination of the body of the gentleman which our fleet is bringing to this country failed to detect any scars. This apparently places us in the unfortunate dilemma of having to call John

Paul Jones a liar or the corpse an impostor. We do not like to think that our naval hero was one who boasts of scars but never felt a wound, nor will it be pleasant to be compelled to open up that splendid tomb at Annapolis and take out the body we are placing there with so much ceremony and send it back to France on a cruiser with apologies for getting the wrong box. Yet it is quite possible that some time in the future a body may be discovered in a Parisian cemetery bearing a more certain token of identification than a crooked mark on the linen which looks like a “P” and equally like a “J” and is, therefore, taken as a monogram of both initials.

This naturally suggests the perplexing questions whether the patriotic sentiments which the proximity of these supposedly heroic bones will have aroused in the breasts of thousands of tourists will be invalidated if these sacred relics should be discovered to be spurious some fifty years from now, and whether the inspiration which the naval cadets will have received from being educated in the neighborhood of Commodore Jones will fail them when they come to know that the tomb is only a cenotaph? It may be that some action by legislation might be taken in that case which would validate such emotions and sentiments, proper in themselves, but having a fictitious origin, as has been done where an illegally elected justice of the peace has for years performed marriage ceremonies.

A very similar case, which perhaps may be of value as a precedent, occurred in Italy in the fifteenth century. The Benedictines of Padua had for three hundred years possessed the body of St. Luke, which had proved very efficacious not only as an aid to devotion, but also as a means of procuring offerings from the devout, who sought the intercession of the Evangelist to secure favorable answers to their prayers. The Franciscans of Venice, however, came into possession also of an alleged body of St. Luke, and the Benedictines appealed to Pope Pius II to issue an injunction against their rivals in the miracle business. The case was tried before Cardinal Bessarion, the Papal Legate at Venice, and lasted three months. Unfortunately the Bertillon system of measurements was not avail-

able at that time for identifying the remains, but nevertheless the Benedictines had quite as strong evidence in favor of their claim. This was that the head of St. Luke had been given in 580 by the Emperor Tiberius II to St. Gregory, and was still to be seen in the Basilica of the Vatican. The Benedictines argued that since their St. Luke had no head it was more probable that it was the right one than that of the Franciscans, which had a head of its own. Nevertheless the representative of the Pope decided in favor of the Franciscans, and the St. Luke of Padua was declared an impostor. This somewhat peculiar decision was possibly based upon the idea that it was not so much a wonder that St. Luke should have two heads as that one small head should carry all he knew. Besides, such anatomical peculiarities were nothing new for St. Luke. There was a third, or perhaps we should say a fifth, arm of his preserved in the Basilica of S. Maria ad Praesepe.

Of course in patriotic osteolatry, as in religious, such unfortunate questions are liable at any time to arise. But it is certainly regrettable that so much money and trouble should have been expended with so dubious a result. Four cruisers of the North Atlantic fleet have been taken from their regular duties and sent on a voyage of 6,000 miles at a cost of \$30,000 to \$50,000 to bring to America what may after all be only a dead Frenchman. Mr. Porter has devoted a large amount of his valuable time to sorting over bones in the Parisian cemeteries, adding the duties of coroner to those of Ambassador without any increase in his salary and at considerable personal expense.

The French have been too careless in the management of their cemeteries. They have desecrated, consecrated, secularized and reconsecrated them, and transposed and scattered remains regardless of possible complications on the Day of Judgment, even going so far as to upholster the catacombs with friezes of vertebræ and dados of skulls. They seem to think that when a man gets through with his body it is of no value to anybody else. They evidently did not suspect how precious such relics would be to the patriots of the future. In fact,

we ourselves could hardly have foretold that patriotism would take this form with us. It is only a few years since we were making lots of fun of the Chinese for transporting the bodies of their dead back to the Celestial Kingdom, and now we have adopted the custom. In order that the dust of John Paul Jones may mingle with the sacred soil he helped to free, as has been recently said in several periodicals, we send Sigsbee's squadron across the Atlantic. Would it not be cheaper to ship to Europe a sufficient quantity of our sacred soil to put around the coffins of distinguished Americans who have died abroad, thus securing exterritorial entombment? This plan has been successfully adopted in the Campo Santa at Pisa, where enough soil has been brought from the Holy Land to form a burying ground, so that the devout deceased need not be transported to Palestine to secure the benefit of such burial. But nevertheless the presence at Annapolis of the remains of Commodore Jones, or whoever the gentleman is, will be a great object lesson to American youth, as, indeed, others have said before. It will teach them that if they in their turn become naval heroes they, too, will not be allowed to rest in peace in their graves, but will be liable to be dug up and Bertilloned like a criminal and transported to another continent whenever larger appropriations are needed for the navy.

The Presbyterian Prayer Book

THE Presbyterians have a Prayer Book. It is not as yet a divinity-calf book with a purple marker, but only a plain, blue covered pamphlet report. Nevertheless it is a Prayer Book, and the churches which fought very shy of organs not so many years ago can now confess their sins according to book, all together, in a general mumble, receive assurance of pardon from their minister and join in petitions not one word of which is trusted to the unction of the hour.

It came about in the following manner. In 1903 the Synod of New York and the Presbytery of Denver sent up overtures to the General Assembly petitioning for a book of simple forms and services for use in the celebration of the

sacraments, in marriages and funerals and in the conduct of public worship. The matter was referred to a committee, of which the Rev. Dr. Henry Van Dyke was chairman, who tactfully recommended that a committee on forms and services be constituted and that they be instructed to prepare a book, but "to avoid those forms which savor of ritualism; to embody sound doctrine in the language of orderly devotion and to keep ever in mind the end of Presbyterian worship, which is that all the people should join in the service of God."

Dr. Van Dyke was made chairman of this committee and with him were associated such men as President Hall, of Union Seminary; Prof. John De Witt, of Princeton; Dr. Richards, of the Brick Church of New York, and Dr. Louis F. Benson, the editor of the Presbyterian Hymnal. The committee labored a year in the preparation of a Prayer Book which would avoid ritualism and presented a miniature book to the Assembly of 1904, together with a masterly *apologia* designed to conciliate the minds of any recalcitrant brethren disposed to discern unfitness in Presbyterians praying by book. It was to be only for "*voluntary use*" (italics not ours) and was to embody portions of the Genevan Liturgy of John Calvin and some of the mild and pleasant phrases of John Knox, together with extracts from the Scottish Psalm Book of 1595. So the committee was continued, collected prayers and composed forms diligently, and a genuine Presbyterian Prayer Book, of considerable size, was approved by the recent Winona Lake Assembly, and the publication of the completed work, without further submission to the representatives of the churches, was authorized and it is offered for public use.

The Prayer Book as it now is, "re-printed for information" by the Presbyterian Board of Publication, is not a bad book. The liturgies of the centuries have been searched for devout and beautiful prayers, and the forms for public worship and for baptisms, ordination and the communion are dignified, chaste and reverent. The inclusion of prayers from literary sources is to be commended. We note selections from Samuel Johnson, Thomas Arnold,

Jeremy Taylor, E. B. Pusey, Christina G. Rossetti and Robert Louis Stevenson. On the other hand, the omission of the "Collect for Peace," beginning "O God, Who art the Author of Peace and Lover of Concord," is unaccountable. That surely is one of the most inspired prayers ever written.

The excellence of the orders for morning and evening worship is spoiled by their length. A congregation which tried the morning service for several months found that it could not be conducted in less than an hour, and gave it up for this reason. An hour and a quarter is long enough for an ordinary church service, and the minister should have thirty minutes for his sermon if he wants it. A form of worship an hour long will have one of two results—if indeed not both—the service will be hurried or the sermon will be relegated to a subordinate position. The strength of the Presbyterian Church has been in the strong, thoughtful, doctrinal preaching of its ministers. It is for instruction in Christian truth and help in Christian living that people go to church, and the Presbyterian fathers and brethren would do well to hesitate before obligating themselves to an order of worship which steals time from their sermons.

If we might suggest an omission it would be that of the Apostles' Creed. It is urged that confession of one's faith is an essential element of worship. But is not the very fact of worship a confession of one's faith? Does not one confess faith by joining heartily in worthy Christian prayer? Or can one sing "Rock of Ages" without declaring his faith? The world in general has understood Presbyterians to be confessing their faith quite vigorously on several occasions hitherto when they were not using the Apostles' Creed. A creed is very often a challenge to a man to consider what he does *not* believe. Such a confession of faith calls up doubts and does not allay them, while the implied confession of a devout hymn or a genuinely pleading prayer soothes the spirit.

Moreover, the Apostles' Creed in particular has a bad record. It has stirred no end of discussion in England, forced pious men out of the Church and compromised in the eyes of the people some

of the most scholarly and devout adherents of the National Church. The strife in Germany has been even more intense. Why should the American Presbyterians saddle onto themselves a weight which their brethren have found almost intolerable? The Apostles' Creed contains a clause which has to be explained away by Protestants ("I believe in the Holy Catholic Church"); an article which no one believes any longer (the resurrection of the body), and a doctrine which many leading scholars have given up as belonging to a later stratum of New Testament tradition, and which is sure to be the subject of future controversy (the doctrine of the virgin birth). The admission of the Creed is unwise tactically and undesirable from the point of view of restful, spiritual worship.

This Prayer Book is "for voluntary use," and it is a question how far Presbyterian churches will desire to use it, or will find it advisable to do so, however much it be improved. It has arrived at its present state only through the exceedingly skilful efforts of the chairman of the committee, Dr. Van Dyke. He is said to have sacrificed a large proportion of his time the past two years in labor upon this book, and his earnestness in the cause was evidenced in his consummate handling of the matter before the Assembly. He won a hostile audience, and at the close of his speech made them join in a prayer from his book, a prayer of John Calvin! What can you do against a man who will pray in a debate? But in the particular churches, where the real trial of the book must take place, the suavity of the trout-lurer will not be had, and the staid Presbyterians may find that their blood goes back more to the Puritan, who used prayer books for gun wadding, and to Wesley, whose spirit was too large for any book, than to Calvin and Knox, of whose Books of Common Order Dr. Van Dyke has made such skilful use.

Just One Book

WE have tried it and know of what we speak—a vacation without a book is a failure; what we need is just one book.

A modern man cannot stand it to live in the woods for a month without a book. He may get on without a newspaper for a week or a whole month, but books have become so much a part of an intelligent life that one may more easily endure separation from human companionship.

We began with carrying a satchel full, but that was a failure. Those books had to be read; what else were they for? The reading woke trains of thought and gave birth to articles and editorials. Why should these be still-born? The result was a restless vacation. What we want of an offing is change—not too absolute—no wrench from home associations; only a big twist out of common channels. Vacation should work as when the countryman saws off a limb but grafts in a new stock. Life is not interrupted, nor is there a total break of continuity. Only there is to be no fruit in that limb for a time, in order that after a while it may bear a much better sort. So we rest in order that we may do better work. Plainly what we need is just one book and that wisely chosen.

Reading is not tiresome; it is the hurry of mastering so much printed matter that wears us out. Good book reviewing is the most wearisome work that town life puts upon us. It is the twist of the mind to a dozen topics in close succession that disarranges the brain cells. We have come to associate duty with reading—our fathers did nothing of the kind. We are under intellectual obligation to keep pace with literary evolution. One book used to be enough. A single volume came from the press about every six months. It was heralded with general delight. All classes read it; everybody read the review of it—took sides, belabored or befriended the book. All this is a thing of the past. We pile up books, we stack them in corners; we feel plagued by their pertinacity. To get into a far away nook with just one book is to get out of the most pertinacious crowd of the day. That is the glory of vacation. Nobody can say, "Read this!" or "Have you read this or that?"

Then came the question, What one book shall we take? Size must have something to do about it, rather than mere contents. It must be materially light weight, easily packed, easily handled. It

must not be obtrusive, must be modest and considerate. It should be easily held in a hammock while on one's back, and if it fall as we drop asleep it should not make a noise to awaken the sleeper. It must not be red or gaudy in its binding; a little top gilt is barely pardonable. Perhaps green is the ideal color, as calling less attention to itself under the trees. Shall it be a book of poems; say poems on Nature? These are barely tolerable at any time. Who wishes to have apple trees and brooks translated to him? Let them do their own singing. As for theology, not a bit of it out in the fields and woods. If we cannot find God out there ourselves, or let him find us—why, we are best left alone by the chalk and pointer of the theologian. Of all things we do not want novels. We shall have feelings and sentiments enough of our own, and they ought to be undisturbed by the soul agitations of other people.

What book then shall it be? We picked up Higginson's "Outdoor Studies," but laid it down; then "The Birds About Us," and "Birdland Echoes," by Abbott, but we dropped them as taking us into fields a bit foreign to our bent. Professor Parson's sumptuous volume on New Zealand tempted us, but clearly one could not stand the nervous thinking it would stimulate, unless indeed he be a professional reformer. We lifted with tenderness Powell's "The Country Home," but it weighed just twice too much. At last we spied John Burroughs's "Far and Near;" it was just the thing—right weight, not too intent, not speculative, and the author will not be angry if we go to sleep while he is talking.

Burroughs is a good companion, because he sees much, and generally very accurately, the surface of things. He does not often go down to delve into causes or into abstract analysis. He rather lacks in sympathy with country problems. He dislikes those who see too much in Nature—especially too much intellectuality in animals. Yet he is convinced that "A duck has more sagacity than any other of our common fowls." Thoreau is a totally different observer—digs constantly to look under facts. Burroughs hates collectors and is a real lover of the simple. The hunter with his rifle and the collector with his bag are to him

equally objectionable. They are destroying some of the best things God has made and are making the world over to a lower type. The truth is we have never had a better descriptive poet of natural scenery—only it is in prose that he sings best. His rimes are worse than those of Thoreau.

What to do with your one book when you have it is a delicate problem. It makes no difference what your ordering of the days may be while you are in harness, but during vacation the days must be allowed to order you. In the morning you must rise at daylight, but do not touch the book. Look at it and kindly say, By and by you shall go with me, but not now. This is the hour for companionship with Nature. At daybreak as at no other hour there are spirits abroad—incarnations of the universal life. Start off for the hilltops; go while the dew is not yet drunk by the sun, while the farmers are calling to the cows to come in from the orchards to be milked. The time for the book and about the only time for such companionship is along through the afternoon.

It is then that you grow more or less tired of Nature. You are thinking of home and of its furnishings, its companionship and its libraries, its duties and its dutiful pleasures. If this were to go on—if there were to be no more mornings and evenings—if you could not go to bed with the birds, and could not smell the fresh morning messages from the pines and the orchards, you would as soon go back to the routine life. Now you open the book. It breaks up the channel of thought. It gives you just enough intellectual stimulus, and when you drop asleep you have a peaceful sensation that after all you are at home; for is not your highest work just to see well and to smell well and to hear well? When at last you come home is it not really coming away from home? You draw the book from your pocket with a tender warmth and lay it where you can easily place your hand upon it, believing that you will take it up again to-morrow, or soon; but you will leave it there till the dust is brushed from it and it finds its place in the long rows that fill the shelves of your library. The book has done its work and has done it well.

Dolge and
Loomis

A letter was sent to the New York papers last week by Mr. O. L. Church, of East Orange, N. J., charging that Rudolph Dolge, Consular Agent of the United States at Caracas, Venezuela, is unduly interested in concessions in the country where he serves; that he controls two papers which never tire of adulating President Castro (Castro has decorated Dolge); and that he uses the coat of arms of the State Department of the United States for an advertisement of a laundry which he owns. Furthermore, Mr. Church alleges that because of his friendship with Assistant Secretary of State Loomis Mr. Dolge has had five months' leave of absence in the United States out of the last twelve, which time, when he was not testifying for Mr. Loomis in the Loomis investigation, he spent in trying to float a concession from the Venezuela Government, which was of great value. Mr. Dolge, who was in New York before he sailed for Venezuela last week, admitted that these charges were substantially true, tho he failed to see where they were in the least discreditable. As a Consular Agent, he said, he was not a salaried officer and was permitted to engage in business without restriction of any kind. We admit the legality of his engaging in private business, but that he should be doing diplomatic work for Mr. Loomis when a United States Minister was in residence for that sole purpose, and that he should have enjoyed a five months' vacation in this country, is a matter of some concern to those who have the good name of the State Department at heart. In this connection it is interesting to refer to the official "blue book" of the Loomis scandal just published by the State Department, and which we are glad to learn the President has ordered sent to every member of Congress. In this book it appears that Mr. Dolge was, with the exception of one Jaurett (a fugitive from Mexican justice), the chief witness for Mr. Loomis. From Dolge's own statements we learn that his relations to Assistant Secretary of State Loomis "were thoroughly understood

by Secretary Taft." In a letter to Mr. Loomis from Caracas, dated February 18th, he announces his arrival at Caracas, and after stating that he had called upon General Ybarra and Dr. Cardenas he continues:

"That same day the decision of the court was handed down, confirming the legality of the temporary sequestration, and while I need not assure you that I used the utmost discretion to avoid the slightest opportunity for any basis of gossip, yet both Captain Wright, as well as Mr. Bowen himself in his conversation to me on the following day, confirmed the statement which Mr. Bowen had made that I had come with instructions from you . . . to Mr. Carner, on the strength of which, after my interview with General Castro (supposed to have taken place at 10 a. m.), the latter had the court decision changed by noon of the same day."

Carner, it will be remembered, was a former employee of the New York & Bermudez Asphalt Company, who after leaving that employment became, according to Mr. Bowen, Castro's agent. Mr. Bowen also reported that Mr. Dolge was believed to be the bearer of a letter from Loomis to Carner, promising that the United States Government would not intervene in the asphalt business. Now as the *New York Times* most pertinently asks: "What had a mere Consular Agent to do with the asphalt matter, or with the plans of the Government? Who appointed this Consular Agent officer of the Department of State?" And we add, who granted him permission to spend five months out of the last twelve in this country? Could it have been Mr. Loomis? All this evidence as to the relations between Dolge and Mr. Loomis simply deepens the mystery which surrounds the treatment of Mr. Loomis by the Administration, and makes it more difficult to understand how he can retain the confidence of Mr. Roosevelt.

Civic
Righteousness

Last December the New York Child Labor Committee, under the chairmanship of Robert Hunter, made such a good fight against the reappointment of John McMackin as Labor Commissioner of the State of New York that Governor

Higgins was forced to appoint some one else in his place, despite Mr. McMackin's support from the Republican machine. The Child Labor Committee showed that hundreds of children under fourteen years of age were working in factories in flagrant violation of the law which Mr. McMackin was elected to enforce, and that Mr. McMackin was employing his department force in work that would have been more appropriate if confined to the State Campaign Committee of the Republican Party. In view of these facts some surprise has been evoked that Mr. McMackin has just been appointed by President Roosevelt United States Consul at Georgetown, British Guiana. Mr. Roosevelt must have known of Mr. McMackin's record, but he was apparently willing to pay some New York politician's debts, just as on other similar occasions he was glad to pay Senator Quay's debts. Thus again the President affronts that large class of respectable people upon whom he is ever urging the practice of "civic righteousness."

A Declaration of Independence in Spelling

The new movement for the simplification of spelling is meeting with surprising favor. A short preliminary canvass a month ago found four out of five of those approached on the subject were willing to adopt the "Twelve Words" in private correspondence, and not one out of ten was opposed to it. The list includes such well-known names as E. Benjamin Andrews, Cyrus T. Brady, David J. Brewer, Hezekiah Butterworth, George W. Cable, Paul Carus, J. McKeen Cattell, Samuel L. Clemens, Melvil Dewey, Isaac K. Funk, Hamlin Garland, Richard Watson Gilder, Thomas Wentworth Higginson, Newell Dwight Hillis, William Dean Howells, Thomas R. Lounsbury, Francis R. March, Edwin Markham, Brander Matthews, Simon Newcomb, William J. Rolfe, Minot J. Savage, Ernest Thompson Seton, Albion W. Small, Andrew D. White and Robert S. Woodward. The most promising feature about the reform is that it starts with the people themselves. For many years philologists have pointed out that our present English spelling has no historic justification; dictionary makers have gone as far as they

could toward simplifying and systematizing it; teachers have passed resolutions against it; publishers have declared their willingness to adopt better forms if their readers would not object; but all have agreed that the reform could only be accomplished by a concerted popular revolt against the irrational, troublesome and unnecessary inconsistencies and complications of English orthography. Such a revolt has now started under favorable auspices and backed by plenty of money, and it promises to be a revolution. All who are willing to sign the "Declaration of Independence" and agree to use in private correspondence the amended spellings of the twelve words, *program*, *catalog*, *decalog*, *prolog*, *pedagog*, *dema-gog*, *tho*, *altho*, *thoro*, *thorofare*, *thru*, *thruout*, should send in their names to the Secretary, Charles P. G. Scott, Yonkers, N. Y. THE INDEPENDENT has for many years stood almost alone among the periodicals of this country in using the first eight of these rationalized forms.

Food Preservatives and Digestion

Considering the large amount of talk we hear and the small amount of information we have on the subject of the effect of the preservatives in common use on the health, the papers bearing on this point recently presented to the American Chemical Society are of interest. Mr. Gudeman made a great number of experiments on the digestion of egg albumen by the two most important of the digestive ferments of the body, the pepsin of the stomach and the pancreatin of the intestines, in the presence of various condiments, preservatives and coloring materials. He found in general that these do not interfere with digestion in quantities of one part in 400, which is, of course, much more than the amount ordinarily used in the seasoning and preservation of food. He found no grounds for the common prejudice against artificial or chemically prepared dyes over the natural ones. Both the artificial and the vegetable colors digested in the same proportions and have the same food value. Mr. Duckwall experimented on guinea pigs and rabbits with two preservatives now frequently used, benzoic and salicylic acids. He found that these substances did not

impede digestion and did not injure the growth of the animals. Of course these experiments are not conclusive, for the stomach of a man differs from that of a rabbit or guinea pig, and still more from the test tubes used in the first tests; but they indicate that we are not yet justified in concluding that chemical preservatives and colors are so injurious that their use should be prohibited by law under all circumstances.

Philadelphia's District Attorney In his interesting letter of advice to the Mayor of Philadelphia, Secretary Root speaks of District Attorney Bell's refusal to begin the prosecution of prominent members of the ring either before a grand jury or before a committing magistrate, but does not discuss "the reasons which lead the prosecuting officer to take this course." As the attitude of this District Attorney may seriously affect the pursuit of the ring in the criminal courts, these reasons become a matter of considerable interest. Some of them seem to be indicated by Mr. Bell's admissions that for two years he has been counsel for the firm of ring contractors in which Boss Durham and his right-hand man, Senator McNichol, were the concealed owners of an interest amounting to eleven-twelfths; that during the same period he has also been counsel for Senator McNichol and has recently been preparing to defend him in suits by which the city will attempt to recover a part of the money paid to the firm; that he is associated in business with the uncle of a Councilman recently arrested for having an unlawful interest in ring contracts, and that he owns \$120,000 worth of the stock of the United Gas Improvement Company, whose attempt to fasten a new gas lease upon the city aroused the people and caused the ring's downfall. It appears also that he was indirectly interested, through the holdings of relatives, in land traversed by the unfinished Torresdale Boulevard, whose serpentine course was planned to touch the real estate of friends and avoid that of enemies. Undoubtedly it would be disagreeable for him to ask for the indictment or cause the arrest of his clients and friends. On the other hand, they must congratu-

late themselves upon the continued maintenance of friendly relations between themselves and this officer.

Justice Hooker Escapes

At the end of his trial in the New York House of Representatives Supreme Court Justice Warren B. Hooker escaped punishment, but the vote for his removal, 76 to 67, was morally equivalent to conviction. A two-thirds majority was required. The House was also on trial, and nearly half of its members now lie under the condemnation of their own votes for this unworthy judge. We published the evidence against him soon after the greater part of it was made known in the official reports of the Post Office Department investigation. It has not been disproved; it could not be. Indeed, the leader of the man's advocates in the New York House substantially admitted the force of it, expressing the belief that Hooker would never do such things again, but would be a better judge hereafter because of this experience. "Go and sin no more," said this legislator in conclusion. If Justice Hooker had not so thick a skin he would now resign. But such action is not to be expected. Eight years of his term remain. Those whose votes have enabled him to retain his high place should suffer a loss of public respect and of public office for thus striving to dishonor the bench.

Welfare Work

It is the fashion among the ignorant to smile at "Welfare Work," but Chairman Shonts, of the Isthmian Canal Commission, shows uncommon sense in taking with him a couple of "welfare" experts recommended by the National Civic Federation, who will investigate the needs and opportunities for recreation on the Isthmus for the host of exiled and homesick workers engaged in canal construction. Give a man opportunities for the proper amount of play and he will work all the better. Moreover, you will come somewhere near solving the problem of human happiness, which after all should be the chief concern of every State.

Financial

Fiscal Year's Foreign Trade

FULL official reports of the country's foreign trade for the fiscal year that ended on June 30th show that all records of both exports and imports were broken. Exports for the first time exceeded a billion and a half. All previous records for the month of June were also surpassed. In that month the exports were \$121,095,000, against \$93,224,000 in 1904, and \$108,651,000 in 1900, which had been high water mark. Imports were \$90,435,000, against \$81,157,000 in 1904. The year's exports and imports, with those of nine years preceding, are shown below:

Year ending June 30.	Exports.	Imports.	Excess of exports.
1905...	\$1,518,462,833	\$1,117,507,500	\$400,955,333
1904...	1,460,827,271	991,087,371	469,739,900
1903...	1,420,141,679	1,025,719,237	394,422,442
1902...	1,381,719,401	903,320,948	478,398,453
1901...	1,487,764,991	823,172,165	664,592,826
1900...	1,394,483,082	849,941,184	544,541,898
1899...	1,227,023,302	697,148,489	529,874,813
1898...	1,231,482,330	616,049,654	615,432,676
1897...	1,050,993,556	764,730,412	286,263,144
1896...	882,606,938	779,724,674	102,882,264

Exports and imports combined were \$2,635,970,333 in 1905, against \$2,451,914,642 in 1904. In 1895 they were only \$1,539,500,000. Since that year our exports have almost been doubled.

Atlantic Steamship Trust

THE International Mercantile Marine Company, commonly known as the Atlantic Steamship Trust, makes a bad showing in its report for the calendar year 1904. Net earnings failed by \$2,039,150 to meet the interest on the company's bonds. In 1903 there was a surplus of \$355,000 after paying interest. In neither year, of course, was there any dividend on the preferred or the common stock, of which there is \$102,000,000 outstanding. The bonded debt amounts to about \$71,000,000. Last year's deficit was met in part by using nearly \$900,000 of the insurance surplus, but it may be observed that no provision was made for depreciation of steamships. For depreciation one of the great German lines allowed more than \$3,000,000 last year. The decrease of \$2,194,115 in the company's net earnings was due mainly to the rate war and

the decline of our exports of breadstuffs. For the present year, the report says, there is a more favorable outlook. That is fortunate, for a repetition of last year's experience would suggest reorganization. The company is handicapped by its great overcapitalization and by the extraordinary prices paid for a considerable part of its property. Its organization was characterized by inflation which could be warranted, in a financial or speculative sense, only by possession of an absolute monopoly. This it could not acquire.

RAILWAY gross earnings for the first half of the year 1905 show an increase of about 6½ per cent.

....In the first six months of the present calendar year the output of pig iron in this country was 10,994,500 tons, against 8,173,438 in the first half of 1904 and 9,707,367 in the first half of 1903.

....According to the recent report of the Lyons Silk Syndicate, the world's output of silk was 44,682,000 pounds in 1904, against 39,980,000 in 1903. Our imports of raw silk in the fiscal year just ended were about 17,500,000 pounds.

....It is shown by a report of the British Treasury, recently issued, that in 1903 only twenty persons in Great Britain had incomes exceeding £50,000 a year. Only 200 persons paid tax on incomes between £10,000 and £50,000.

....About 6,000,000 acres of land owned by the State of Texas will be placed on the market in September next. This land, which will be sold to settlers in lots of from one to eight sections, has for some years past been leased to cattle ranchmen.

....Twelve cotton mills in the Spartanburg district of South Carolina paid semi-annual dividends on July 1st at rates averaging about 7 per cent. per annum. In the three months ending with June nearly \$3,000,000 was invested in the South in new cotton mills and in additions to old ones.

....Dividends announced:

Atch., Top. & S. F. Rway. (Serial Debenture, 4 per cent.), Coupons, payable August 1st.
Amer. Chicle Co. (Common), 1 per cent., payable August 21st.

VOL. LIX

NEW YORK, THURSDAY, AUGUST 3, 1905

No. 2957

Survey of the World

Secretary Taft's Party in Japan

A remarkably enthusiastic reception was given in Japan to Secretary Taft, Miss Roosevelt and their companions. At Yokohama, where they arrived on the 25th ult., the city was gayly decorated, and the visitors were greeted on board their ship by Minister Griscom and representatives of the imperial household. Going at once to Tokyo, they were received there in audience and entertained at a banquet by the Emperor, the Princes and the Princesses. They were then taken through the palace gardens, which had never before been opened to foreign guests. Other banquets and luncheons followed in quick succession, and all of these were attended by members of the imperial family. At a dinner given by the Prime Minister he spoke eloquently of Japan's debt to the United States, historically the sponsor of her modern civilization. Among the entertainments were a dinner given by the bankers and merchants, and a garden party at the American Legation, attended by more than a thousand guests. At another garden party, given by the Minister of War, the Marquis Ito, Japan's famous statesman, chanted a poem, composed by himself, in honor of the visitors. On the 29th the tourists left the capital for Kioto. Never before had such a welcome been given to foreigners. The Japanese press gratefully recalled the friendship of the United States since the days of Commodore Perry, saying that our policy had continuously been one of kindly assistance and that American help was clearly traceable in all departments of Japanese progress. Some of them remarked that to American sympathy Japan owed her

ability to reap the fruits of the victories won by her soldiers and sailors. Mr. Roosevelt was commended for his successful endeavor to bring the peace plenipotentiaries together. The tone of the press showed warmth and grateful admiration without precedent in the Empire on any similar occasion. Consequently the Russian press sharply criticises, saying that the moment for this visit was tactlessly chosen and that the incident cannot be devoid of political meaning.

Progress of Reform in Philadelphia

With the approval of Mr. Roosevelt and Secretary Root, Major Cassius E. Gillette, of the Corps of Engineers, has been employed to assist in the examination of the ring contracts for Philadelphia's filtration beds and of the contractors' work. He will be associated with William Barclay Parsons, the eminent engineer, and with John Donald MacLennan, who supervised similar work at Washington. Major Gillette is the army engineer who unearthed the frauds of Captain Oberlin M. Carter at Savannah, showing that the Government had been robbed of \$2,600,000. Carter was sent to prison, and his associates, Gaynor and Greene, fled to Canada.—An examination of the city's voting lists by the police, in obedience to the orders of the new Director of Public Safety, has revealed 31,817 names fraudulently registered. The names of cats and dogs and of thousands of dead men were on the lists. Arthur Burt's name had been there for a long time, altho a monument in one of the cemeteries shows that he died in 1859. Out of 4,985 names in one ward 2,530 were fraudulent; in one

voting district there were only 67 honest registrations out of a total of 294. As it is believed that between 80,000 and 100,000 fraudulent votes were cast at recent elections, Director Potter is not satisfied with this police canvass, and another one will be made.—Evidence of reform in the Civil Service Board (due to the appointment of a new Secretary and Examiner) is shown by the failure of two new Bureau Chiefs (appointed by Mayor Weaver) to pass the examinations and by the success of applicants hitherto unknown, who had no political support.

Senator Mitchell Sentenced

United States Senator John H. Mitchell, of Oregon, who was recently found guilty of using his influence, for pay, in behalf of claims pending before an Executive Department, was sentenced, on the 25th ult., to be imprisoned in jail for six months and to pay a fine of \$1,000. Conviction also carries with it the punishment of disqualification for holding any office of trust or profit under the Government of the United States. Judge De Haven, in pronouncing sentence, said that he had taken into account this disqualification and the Senator's age. Mr. Mitchell is seventy years old. He has been a Senator for 22 years. There are other indictments against him, one of them being for perjury, but it is said that they will not be tried. The case goes up to the Supreme Court, and if the final decision there is unfavorable to the defendant, he will be able to avoid expulsion from the Senate only by resigning. Mr. Mitchell was born in Pennsylvania, and his name was John Hipple. Owing to a disagreement with his wife, many years ago, he deserted her and their two children and went to the Pacific Coast, where, under the name of John H. Mitchell, he prospered, married again, and became prominent in politics. A daughter by his second marriage is the Duchess of Rochefoucauld, and her home is in Paris. The land claims for which he used his influence in Washington were some of those, alleged to be fraudulent, on account of which a considerable number of persons in Oregon have recently been indicted.—The trial of R. M. Cobban for subornation of perjury in con-

nection with many timber land entries in Montana was begun last week. These lands were transferred to United States Senator W. A. Clark, and in another suit the Government seeks to have his title to them set aside.

Agricultural Department Scandals

The grand jury in Washington is considering the evidence as to the sale of cotton reports of the Department of Agriculture by Edwin S. Holmes, Assistant Statistician. Certain speculators in New York, who were implicated by the Department's statement concerning Holmes's operations, have declined to answer the questions of the grand jury and have been supported in their refusal by the court. It is expected that Holmes will be indicted. The sudden departure for Europe on the 22d of John Hyde, Chief Statistician, after his resignation had been accepted, excites comment because he had offered to hold himself in readiness to assist the official investigators.—On the 26th ult. the Department issued a corrected estimate of the cotton acreage, to displace the one given out on June 2d, in the preparation of which Holmes was interested. This corrected estimate is based upon the returns used for the first one, but it makes the reduction of acreage 14.9 per cent. (4,731,000 acres) instead of 11.4 per cent. It is explained by Assistant Secretary Hays that Hyde, "with Holmes at his elbow, prompting him," made an estimate which was not warranted by the returns.—As a result of the inquiry now in progress Dr. George T. Moore, a noted bacteriologist, who has been in charge of the Department's laboratory in the Bureau of Plant Industry, and whose discoveries have attracted much attention, has resigned. He was accused of being interested in a company recently formed to manufacture and sell his bacterial culture for the inoculation of soils and the stimulation of plants growing in them. It appears that the company asked him to leave the Department and enter its service, and that it placed a block of stock in his wife's name, to be transferred to him when he should resign. He resigned in December last, but his resignation was not accepted. Then, his salary

having been raised, he decided to remain, and the stock was returned to the company. His superior officers had been informed as to the company's offer, but not concerning the stock. Complaint was made that the inoculating material could no longer be obtained from the Department, and it was asserted that applicants for it were directed to the company. Dr. Moore had written articles for the magazines, illustrating the value of his discovery. He has also been known in connection with his experiments relating to the use of sulphate of copper for the purification of water supplies. He resigned, he says, to relieve the Department of any embarrassment that might be caused by the criticism to which he had been subjected. Secretary Wilson submitted the evidence in the case to the Department of Justice.

Various National Topics

Mr. Roosevelt declined to accept the resignation of Governor Carter, of Hawaii, who goes back to Honolulu assured of the sympathy and support of the Administration. He is not confident, however, that the disturbing political factions there can be harmonized.—Governor Douglas, of Massachusetts, persists in declining a renomination. According to reports coming from members of a Democratic Committee that recently urged him to reconsider his decision, he says that public life is very distasteful to himself and his family. He has been led by clippings from many newspapers to think that re-election in Massachusetts might cause the Democratic party to take him up as a candidate and even to nominate him for the Presidency. This he desires to avoid.—Daniel S. Lamont, private secretary of President Cleveland during the latter's first term, and Secretary of War during his second, died suddenly of heart disease on the 23d ult., at his country home near New York. He was 53 years old.—The controversies in Congress over contracts for armor plate are recalled by the recent success of the Midvale Steel Company, whose bids have been much lower than those of the Bethlehem and Carnegie Steel companies, but which obtained contracts for a part of the supply with much difficulty, owing

to lack of confidence in its ability to produce satisfactory plate. The company's product has now been subjected to official tests, which have shown that it is of high quality.—The total number of deaths caused by the boiler explosion on the gunboat "Bennington" was 62. A most searching investigation will be made. "I ask all good citizens to have patience," says Secretary Bonaparte, "and if it shall appear that there has been a failure in duty on the part of any one I promise the public that nobody shall be whitewashed, and the service that nobody shall be made a scapegoat."

Yellow Fever in New Orleans

The presence of yellow fever was discovered in New Orleans by the health authorities on the 13th ult., and up to the end of last week there had been in the city 256 cases and 53 deaths. It is now known that there were cases in the city at the end of June, but they were of a mild type and those who had the disease were Sicilians, who are accustomed to avoid the employment of physicians. Thus far the epidemic has been confined to the Italian residents. It is believed that the disease was introduced by ships in the fruit trade from Colon or some other Central American port, and was communicated by infected mosquitoes to the Italians engaged in unloading these vessels. A ship recently brought to New Orleans from Belize 225 refugees fleeing from yellow fever, and the President of the Louisiana Board of Health thinks this may have been the source of infection. The disease has spread throughout New Orleans, but the daily mortality has not been increasing. At last accounts no cases had appeared in neighboring places, except in Tampa, where a fugitive Italian from New Orleans has the fever. A committee of citizens has set out to limit and suppress the epidemic in New Orleans by methods suggested by the mosquito theory of infection. Thousands of men are making a house-to-house inspection, using kerosene oil freely and striving to exterminate that kind of mosquito which is the agent of infection. Federal and local health officers are working together in harmony, and in the screening of patients, as well

as in all sanitary measures, the action taken is in accord with the accepted theory as to the agency of mosquitoes. Open cisterns abound in the city and these receive much attention. Citizens display upon their coats little buttons bearing a picture of the fever-breeding mosquito, with the words: "My cisterns are all right; how are yours?" Rigid quarantines against New Orleans have been established by adjoining States, and by the quarantine regulations in the harbor the city's trade in imported fruit has been diverted to Mobile. At a mass meeting the people of Baton Rouge repudiated and denounced the mosquito theory. Therefore the physicians who were members of the local Board of Health resigned. Just before the steamship "Seguranca" left Colon, on the 25th, with Canal Commissioners Hains and Harrod on board, three officers were taken off, ill with the fever. When the steamship arrived at New York, four days later, the inspectors found that several of the sailors and a few passengers had a disease resembling yellow fever, and they were detained at the quarantine station. This summer, for the first time, Havana, for two or three years past free from the disease which formerly continuously prevailed there, quarantines against yellow fever in the United States.

Chicago's Street Railways

To prevent the city of Chicago from owning and operating a railway in certain streets where the franchises appear to have expired, the Chicago City Railway Company applied, last week, to the Federal Circuit Court for an injunction restraining the city from granting a franchise to any competing company for a line in those streets, from attacking the applicant's franchise for those streets, and from enforcing an ordinance of March last, which repealed the permits under which the applicant has been doing business in some parts of the city. The Mayor has found 126 miles of road the franchises for which have expired. Other franchises soon to expire will increase the length of available streets, he asserts, to 243 miles, and he would have the city control service on these streets through the agency of a corporation. It

is to prevent this that the injunction is sought, the applying company relying in part upon the ninety-nine year franchises granted more than forty years ago by the Legislature. The validity of these franchises at the present time is not admitted by the city. Some think that the application will seriously prolong and complicate the litigation in which the municipal ownership projects were already involved.—The report of Mr. Dalrymple, the Glasgow railway manager, to Mayor Dunne has not been given out for publication. It is understood, however, that this expert is still of the opinion that municipal politics in Chicago must be reformed before a successful experiment in the municipal ownership of railways can be made there. In an interview published in a London railway journal he predicts that municipalization of our street railways will eventually take place, but only after the "elimination of the present methods of political influence" in the cities. He remarks that efficiency is sacrificed to expediency in a system that makes "every municipal officer a little center" of political influence. "It is the old idea," he continues, "of the spoils to the victors. If a man works to get a councilman in, he expects to be paid for it. How can you expect satisfactory municipalization under such conditions?"

Home Rule Conven- tion in Porto Rico

A convention attended by delegates representing both political parties and sixty-five of the sixty-six municipalities of Porto Rico was held at San Juan on the 25th ult. to ask Congress for sweeping changes in the government of the island. Several of the delegations were led by Mayors of cities, and the chairman was Mayor Todd, of San Juan. A memorial was adopted. In the beginning it complains that now, seven years after the American invasion, the preponderance of power rests with an Executive Council composed of heads of Departments appointed by the President of the United States. These officers, it says, "arrive here knowing nothing of the language, customs, or needs of the country, and twenty-four hours after disembarking take their seats in the Council and de-

termine the fate of the island." No change in the composition of the House, which consists of 35 elected members, is suggested, but the memorialists demand the following amendments to the Foraker law, under which the island is now governed:

(1) The organization of an insular Senate, to be composed of two Senators each from seven districts, in place of the present Council.

(2) That the proposed Senate and the House possess the same privileges that were granted to the House under the Foraker law.

(3) That the Secretary of Porto Rico, the Attorney-General, the Treasurer, the Auditor, the Commissioner of Education and the Commissioner of the Interior continue in their present offices under their present titles, but that they form no part of the Executive Council.

(4) That the officers named be appointed by the Governor with the consent of the insular Senate, and not by the President of the United States.

By a rising vote the memorial was adopted, and the delegates cheered for five minutes. There was also adopted a petition asking the insular Legislature to give the municipalities autonomy. Press reports say that the convention was characterized by an absence of partisan political feeling, as well as by unanimity of purpose and a spirit of earnest determination. Mayor Todd was made president of a permanent Municipal League. The convention was suggested by him because, it is said, of a growing anti-American feeling throughout the island.

The Swedish Cabinet Resigns

The Swedish Riksdag has emphatically disapproved of the policy of letting Norway depart in peace recommended by the Swedish Government and approved by the King, and in consequence of this the Swedish Cabinet has resigned. The special committee appointed by the Riksdag reported unanimously that the Government bill could not be adopted in the form in which it was presented to the Riksdag, and proposed that the Riksdag signify its willingness to negotiate with Norway for the dissolution of the union if the Norwegian people by vote

expressed themselves in favor of the dissolution:

"It is self-evident that the union was not dissolved by the Storthing's action. A contract cannot be broken by one party's Parliament. Therefore the Storthing's action can only be considered as Norway's declaration that she does not desire any longer to maintain it. It is for Sweden to decide what action is necessary. According to the laws she would be fully justified in using the necessary force to re-establish the union. This would seem to be the natural course in the first excitement, but reflection shows that it would be against the true interests of Sweden. There was great mutual advantage in the union, but its maintenance by force would make the union a source of weakness instead of strength. Sweden should not, therefore, employ force, but must insist that its permission is necessary to its dissolution. Sweden must agree to the cancellation of the Act of Union on certain conditions, insisting, as a preliminary, on a satisfactory settlement of all affairs mutually affecting the two countries."

In case the Storthing is supported by the people then negotiations between the two countries can be begun, in which case Sweden should insist upon the following terms:

"First—The establishment of a zone on each side of the frontier separating the kingdoms, within which the existing fortifications shall be razed and new fortifications may not be erected."

"Second—The right of pasturing reindeer belonging to Swedish Laplanders in North Norway."

"Third—That the transit trade through both countries shall be secured against unjustifiable obstruction."

"Fourth—That the status of Sweden in respect to foreign Powers, as established by treaty, shall be clearly defined, so that Sweden shall be completely freed from responsibility for Norway to other states."

The report of the committee was adopted in the First Chamber without debate. In the Second Chamber the Social Democrats under the leadership of Herr Branting opposed the recommendation of the committee to raise a loan of \$25,000,000 to make such arrangements as may be made necessary by the new conditions. It was objected that this was practically a threat to use military force against Norway,

and was contrary to the peaceful tendency of the resolution. The Norwegian Storting upon learning of the action of the Swedish Riksdag unanimously voted to submit the question of dissolution and fixed August 13th for the date of the Referendum. Mr. C. Hauge, formerly First Secretary of the Swedish and Norwegian Legation, has presented a request to our State Department for recognition of Norway as an independent nation. It has been referred to the President, but it is not expected that any action will be taken by the United States or by any other Government until Norway and Sweden come to an agreement.

The Baltic Nothing has yet transpired of what took place on the night when the yacht "Polar Star" met the yacht "Hohenzollern" off the Island of Bjoerkoe, but the mere fact of a private interview between the Czar and the Kaiser having taken place at this crisis is sufficient to rouse speculation and anticipation all over the world. Whether the Emperor Wilhelm gave advice to the Emperor Nicholas on the best way of keeping down the Socialists, or on the conditions of peace; or whether he sought the interview merely to spite France and England, or to arrange an agreement by which the Baltic is to be made a closed sea, will probably not be known to the public for some time, if at all. Great interest is, however, taken in the question of the Baltic in connection with the dissolution of the union between Norway and Sweden. If Russia definitely renounces her ambitions in the Far East she is likely to take more interest in European politics, and in this Germany can render her more aid than France. It has been suggested in many quarters that the Emperor Wilhelm is trying to arrange a union of the three Scandinavian nations, and to secure the favor of Denmark he will recommend placing a Danish prince upon the throne of Norway. The "Hohenzollern" is now at Copenhagen, and the Emperor Wilhelm in consultation with

King Christian. It is reported that he wished also to visit Stockholm, but was requested not to by King Oscar lest it should render his relations with the Norwegians more difficult. To secure the approval of the Czar for the proposed Scandinavian state or for the placing of a Danish or a Hohenzollern prince upon the throne of Norway, it is suggested that an arrangement might be made which would attain for Russia her long desired port upon the Atlantic Coast, Lyngen Fiord, which could be annexed to Russia by extending the boundary of Finland across the northern end of Norway. This is what Dr. Sven Hedin and other Swedish statesmen have threatened would happen to Norway in case she dissolved the union with Sweden. Apparently as a counter stroke against this scheme for making the Baltic a closed sea like the Black Sea, the British Government has announced that the Channel fleet will sail for the Baltic Sea on August 20th, and remain there through September for the purpose of executing maneuvers. No ceremonious visits will be paid, as it is regarded as merely a practice cruise in the open sea. Emphasis has been given to this movement by the discussion on the naval works in the House of Commons, in which Arthur Hamilton Lee, Civil Lord of the Admiralty, announces that the Admiralty has decided not to proceed with the extension of the dock facilities at Chatham, but that instead work would be concentrated upon the new naval base at Rosyth, the Firth of Forth, Scotland. The first works completed will cost \$12,500,000, but will be so arranged that they can be extended. Mr. Lee, in explaining the reasons for this, said there was perhaps a probability that war ships in the future would be fewer in number and larger in size, and would require more berthing and docking space. The Admiralty had decided that Rosyth possesses greater strategical advantages than Chatham. These remarks of Mr. Lee attract special attention on account of the speech which he made last February at a dinner in Hampshire, when he said that the center of naval power in Europe

had been shifted during the last few years. The English need not now keep their eyes upon France and the Mediterranean, but they ought to look with more anxiety, tho not with fear, toward the North Sea. It was for that reason that the fleets had been distributed so as to enable them to deal with any danger in that direction, should it unfortunately occur. If war should be declared the British navy would be able to reach the enemy before they could prepare their attack. This speech aroused a great commotion in the German press, which is being renewed in consequence of the proposed maneuvers. The *Reichsbote* voices the anti-English feeling of Germany in the following words:

"In consideration of the interests of the countries bordering on the Baltic, for which it may easily become a vital question, the time has come to make the Baltic a mare clausum for foreign war ships, to close it entirely to their incalculable maneuvering projects.

"The question at stake is of great significance to all the Baltic States without exception. If we were to conduct maneuvers close before Portsmouth, as the English intend to do before Neufahrwasser, we should certainly soon hear vigorous protests.

"When the world was smaller the Baltic played a great rôle in politics. Now the German Empire must be and must remain supreme master in the Baltic, and must do everything to make this supremacy stable. We cannot see what objection England, if she has no rival aggressive designs, could raise against this."

In Russia Rioting broke out in Nizhni Novgorod on Sunday, July 23d, and continued for four days before it could be stopped. No clear reports of cause and character of the disorder have been received, but it is reported that the town was in the hands of a mob numbering thousands, who attacked all respectable people on the street and pillaged the houses. The workmen divided into two camps, the socialists in one and their opponents in the other, and fights occurred every day between the factions, in which clubs, revolvers and bombs were the weapons. The official report of casualties gives 16 killed and 53 wounded. Women and children were not spared and the bodies of those slain in the

streets were found mutilated.—The trial of the mutineers of the battle ships "Kniaz Potemkin" and "Georgi Pobiedonosetz" will be held on September 8th at Sevastopol, where the men are now imprisoned on a transport. The Black Sea squadron, with the exception of the "Kniaz Potemkin," has resumed its maneuvers for the purpose of showing the trustworthiness of the crews, but a strong guard of picked troops has been placed on each ship. The Governor of Odessa has issued a proclamation in which he charges the Jews with being to blame for all the recent disturbances in that port, including the mutiny of the battle ships. One of the mutineers has published the statement that there was not a Jew on the rebellious battle ships at the time, but that the men revolted out of sympathy for the workingmen.—The Marshals of the Nobility of St. Petersburg have declared in favor of the political reforms advocated by the Zemstvo Congress recently held at Moscow. The *Novosti*, a Jewish Liberal paper, has been suppressed for two months for publishing under a thin disguise a report of the Zemstvo Congress. The police entered the houses of the president and the secretary of the permanent bureau of zemstvo organization at Moscow and seized all the documents relating to the proceedings of the Congress. The Moscow police have received orders to disperse all political meetings.—According to the report of the Government Statistical Committee there has been a complete failure of crops in 41 of the 60 provinces of European Russia. In some other provinces the harvest will give very poor results. In the Polish provinces there will be good yields.—The report of the Buligin Commission, appointed by the Czar to prepare plans for a national assembly and administrative reforms, will be considered by the Czar and his advisers at Peterhof on August 2d, and, if approved, the Czar is expected to go to Moscow to promulgate the law from the Kremlin according to ancient custom. The plan as recommended by the Council of Ministers provides for electoral colleges in which the representation will be in part by classes. The only classes excluded from the franchise are soldiers,

persons under the age of twenty-five years, foreigners, women, Governors and Vice-Governors of provinces, prefects and police authorities, nomads and persons deprived of civil rights. For St. Petersburg, Moscow and eighteen large cities there will be a system of electoral colleges. For St. Petersburg, Moscow and eighty other towns the members will be elected by electors of the first degree, comprising owners of real estate exceeding 3,000 rubles in value, the electors in the case of St. Petersburg, Moscow and 1,500 other towns to include also the holders of industrial patents and paying specified taxes, with no distinction as to religion. For the provinces a similar system of colleges will be elected by voters of three categories—namely, land owners, electors of other towns than the previously mentioned large towns and cantonal representatives of peasants. Here also property qualification is required of 1,500 rubles and similar tax qualifications. The elections will be by secret ballot and an absolute majority is required.

The War While the peace envoys are assembling the Japanese continue to push forward military operations, and have for the first time invaded Russian soil. The island of Sakalin, which has been in the possession of Russia for thirty years, has been recovered by the Japanese, and they have landed small forces in Russian territory on the mainland, near Vladivostok. After the capture of Alkova and Alexandrovsk on the island of Sakhalin, the Russians retreated into the hill country to the southeast. At Luikoff (Rykoff), 30 miles distant, they were overtaken, and after some sharp fighting were defeated; 200 of the Russians were killed and 500 captured. The Russian troops numbered about 5,000, with twelve guns. Vladivostok is now closely blockaded by a Japanese squadron, and the town is preparing for a siege. A Japanese army of 40,000 is reported to be marching northward through Korea, approaching Possiet Bay, which the Russians will attempt to defend. There is no ap-

parent probability of an armistice, at least until the Peace Commissioners hold their first meeting at Portsmouth. Baron Komura and Minister Takahira, the Japanese envoys, visited President Roosevelt at Oyster Bay on Thursday and took luncheon with the family. Baron Rosen, the Russian Ambassador, is in New York at the St. Regis, awaiting the arrival of his colleague, Mr. Witte, who sailed from Cherbourg on the North German Lloyd steamer "Kaiser Wilhelm der Grosse." July 27th. Baron Rosen and Baron Komura, altho old friends, will not meet until they are formally introduced to each other by President Roosevelt on the "Mayflower" at Oyster Bay on August 5th.

The Zionist Congress The seventh annual congress of Zionists was held in Basle, Switzerland, July 27th-31st. President Max Nordau, author of "Degeneration," delivered a eulogy in memory of Dr. Theodore Herzl, the founder of the Zionist movement, who died a year ago. The most important matter under consideration was the offer of Great Britain of a tract of land comprising some 5,000 square miles in East Africa for a self-governing Jewish colony. The committee, which had been sent to Africa, reported that the place was not adapted for a colony because it was unhealthy and could be reached only by passing through a dense forest infested with savages and ferocious beasts. Israel Zangwill, the English novelist, recommended the acceptance of the offer provided Great Britain would assign them a larger and more suitable tract of land. After a long and tumultuous discussion the Zionists declined with thanks the offer of Great Britain, and declared their firm adherence to their principles of the foundation of a colony in the Jewish Fatherland—Palestine and in its immediate vicinity. The socialist members withdrew on account of this action. Resolutions of gratitude to the memory of John Hay, who "so often gave assistance to the Jewish nation," were passed. The Congress was attended by 1,000 delegates, representing 22 different countries.

The Princeton Preceptorial System

BY WOODROW WILSON, LL.D.

PRESIDENT OF PRINCETON UNIVERSITY

THE system of preceptorial instruction which we are about to elaborate at Princeton is no new or novel notion of our own, but based upon almost universal experience, upon what every teacher must have found out for himself, whether by way of interpreting his failures or of interpreting his successes; he always gets his best results by direct, personal, intimate intercourse with his pupils, not as a class but as individuals.

College instructors have long observed that their teaching is rendered more effective by dividing large classes into small sections and making each section small enough to enable them to get frequently at each member of the class in the process of test and drill. But even this division of large classes into small sections has not been satisfactory. The sections were usually made up either alphabetically or according to marks or grades received by members of the class in written tests or examinations on the subjects they were studying, the best students being put in one section, the next best in the next, and so on to the dullest in the lowest section. Now, it so happens that God has not classified men's abilities either alphabetically or according to their performances in examinations. I need not urge that he has not used the alphabet; neither will it require much argument to prove to experienced teachers that he has not adjusted gifts to the processes of examination. It by no means always turns out that the men who have got themselves by examination into the first section of the class are the brightest men in the class, or that those who allow themselves to fall into the lowest section are the dullest. The lowest division, in fact, often contains the greatest variety: very bright men, who will not use their gifts in their studies; very dull men, who have no gifts to use, and mediocre men, who are lazy. Separating the class into sections in either

of the two ways most commonly employed is certainly a way of dividing it, but it is not an intelligent way of classifying the individuals who compose it. The intention of the preceptorial system is to enable the instructors to handle the men assigned them either singly or in classified groups, in which men of like training, aptitudes and needs are united.

But the system involves much more than a change of method. It is meant not only, in time, to supersede entirely the old-fashioned "recitation," but also to affect very materially the subject matter of study, to give the undergraduates their proper release from being school boys, to introduce them to the privileges of maturity and independence by putting them in the way of doing their own reading instead of "getting up" lectures or "lessons." The subject matter of their studies is not to be the lectures of their professors or the handful of text-books, the narrow round of technical exercises set for them under the ordinary methods, but the reading which they should do for themselves in order to get a real first-hand command of the leading ideas, principles and processes of the subjects which they are studying. Their exercises with their preceptors are not to be recitations, but conferences, in which, by means of any method of report or discussion that may prove serviceable and satisfactory, the preceptors may test, guide and stimulate their reading. The governing idea is to be that they are getting up *subjects*—getting them up with the assistance of lecturers, libraries and a body of preceptors who are their guides, philosophers and friends. The process is intended to be one of reading, comparing, reflecting; not cramming, but daily methodical study.

One great incidental advantage is expected to accrue to the study of English. The reports of the undergraduates to the preceptors on the reading they are doing will naturally very often be written re-

ports, and it is to be expected that all such reports will be judged of as English as well as with regard to the accuracy or inaccuracy of their subject matter. If not written in good English, they will have to be written over again, and if it turns out that any man cannot use his mother tongue correctly and with some degree of elegance, upon being so corrected and held to a standard of expression, he is to be handed over to the English department for fundamental training. The constant daily necessity to know his own language and to use it properly upon all sorts of subjects will certainly be the most vital system of "theme writing" yet devised, and may be expected to have a quality of reality about it which the formal written exercises of English departments have generally lacked. The men will be using their mother tongue in careful writing, not for the sake of the language itself, but for the sake of releasing ideas and stating facts. Style will be a means and not an end; and it should never in any kind of writing be anything else.

In brief, the system will be a method of study; a means of familiarizing the undergraduate with the chief authorities, conceptions and orders of work in his fields of study. The preceptors will not set the examinations. That would turn them into mere coaches, coaching for final tests which they themselves were to set. They are, rather, to be fellow students, expositors, advisors, to see that the right work is done by themselves taking part in it.

They will not, however, be a body of men segregated and set apart from the general body of the faculty. The present staff of the university will also do preceptorial work; the new preceptors will take some part in the lecture and regular class work, which will still go forward; they will be members of the faculty, indistinguishable in privilege and rank from their colleagues. The fundamental object of the system would be defeated if any sharp line of division were drawn in the faculty between the several kinds of teachers, for the fundamental object is to draw faculty and undergraduates together into a common body of students, old and young, among whom a real community of interest, pursuit and feeling will prevail. The preceptors will only have more conference work to do than their colleagues. It will be their chief, if not their distinctive, function to devote their energies to the intimate work of counsel and guidance I have tried to characterize and describe.

It is our confident hope that such changes will bring about very gratifying results: that the undergraduate will take more pleasure in his studies, derive more profit and stimulation from them, and that the instructor will find vital intercourse with his pupils give place to dull routine. There will be more work done, but it will be less burdensome both to teacher and pupil, more normal, less like a body of tasks and more like a natural enjoyment of science and letters.

PRINCETON, N. J.

'Possum-Time in Georgy

BY SILAS X. FLOYD

YONDAH in de 'simmon tree—
'Possum-time in Georgy!—
Sump'n winks his eye at me—
'Possum-time in Georgy!
Mistah 'Possum, roostin' high,
Tell yo' chillun all "Good-bye":
'Cause dis night you sho' gwine die—
'Possum-time in Georgy!

Fetch de torch an' strike a light—
'Possum-time in Georgy!—
'Possum, tell yo' friends "Good-night"—
'Possum-time in Georgy!

We's gwine cut dis saplin' down,
An' w'en 'possum strikes de groun'
By de dawgs he's gwine be foun'—
'Possum-time in Georgy!

Ain't he lookin' fat an' fine—
'Possum-time in Georgy!—
Come on, 'Riah, an' le's dine—
'Possum-time in Georgy!
Who dat knockin' at dat gate?
We can't let folks in so late!
Come on, 'Riah, pass yo' plate—
'Possum-time in Georgy!

AUGUSTA, GA.

Elihu Root. From a Portrait by A. A. Anderson

The Training of Elihu Root

[This personal sketch of the early life of Elihu Root is by one who has been most intimately acquainted with him throughout his life. It presents a side of his life that is not generally known.—EDITOR.]

ELIHU ROOT was born February 15th, 1845, in the southwest chamber of a building on the Hamilton College Campus, then occupied as a residence by his maternal grandfather, Major H. G. Buttrick. The building, originally built as a Commons Hall, was

in 1850 taken in part for the arrangement of the scientific collections brought to the college by the elder Professor Root. Later it was remodeled and fitted for all the college collections and for lecture rooms. It is now known as Knox Hall. Because the various changes in no

way involved it the birthroom of Elihu Root has remained—save for its case-ments—as it was in 1845.

In the autumn of 1845 Professor Root became principal of the Seneca Falls (N. Y.) Academy, and in that village and on the ancestral farm at Vernon (N. Y.) the boy's childhood was passed.

In 1850 the family moved to Clinton, N. Y., where Professor Root took the chair of Mathematics and Astronomy, lecturing also on Mineralogy and Geology. He at once purchased the house formerly occupied by his predecessor, recently deceased, Prof. Marcus Catlin, and this has since been the family home. It is an old-fashioned house, built late in the eighteenth century. It faces the south lawn of the college campus. Behind it the ground is broken by a deep ravine with lateral branches. Professor Root, a most devoted lover of nature, saw its possibilities; he added a little to his acres and began the making of a wild garden. In this making, which went on for years, Elihu with the older brothers had his share. This exercise—not always, it may be, welcome to the boy—went into the making of the man.

Elihu Root's college preparation was at a small academy in Clinton village, known as the "Grammar School." Its

patronage was meager and its teachers often changed. Only the steadfast study of the boy gave him any fit preparation. An older brother returning to become an instructor in the college supplemented the academy work, and in 1860 Elihu entered the class of 1864 in Hamilton College. He roomed at home with his elder brother, Edward Walstein, then a college junior.* He was a regular, persistent student, mastering each piece of work as it came. He was not disliked in college, tho he was not especially popular. He was in no sense a recluse, but his work was dominant always. He was interested in the sports then in vogue and was president of the College Baseball Association. He did not confine himself to the mere formal requirements of the course. He wrote essays each year in the prize competitions of his class, but he won no prizes. He took great pains in the matter of elocution, and was a prize speaker for his sophomore year; but was not a prize man.

His sole prize in college was the first in mathematics. His successful papers in this competition are in volume 2 of a series of bound solutions preserved by the college. In his senior year Elihu Root was successful in winning an appointment as a Clark Prize Orator, with

The Early "Commons Hall" of Hamilton College as It Was in 1845, in the Western Wing of Which Elihu Root Was Born

The Present Country Home of Elihu Root, College Hill, Clinton, N. Y.

an oration on "The Jew of Dickens, Scott and Shakespeare." He did not win the Clark Prize. On his scholarship record he was awarded the valedictory appointment.

After a year's teaching in Rome, N. Y., young Root entered the New York University Law School. The two New York City law schools were at that time both led by Hamilton College men, friends of Mr. Root and his family—Columbia, by Theodore W. Dwight; the university, by John Norton Pomeroy; both were very able men and successful teachers. Mr. Root chose the University School, possibly because it was smaller. At the close of the first year most of his class applied to the Supreme Court for examination and were admitted to the bar. Elihu Root was urged to do so and circumstance favored that. But he did not believe in meager preparation or in a premature undertaking of his life work. He completed the course as then prescribed. This second year, with but two or three in the class, brought the young law student into close personal contact with Dr. Pomeroy, one of the ablest legal

minds of his generation. He was a deep, thorough student of the law and its underlying principles. He led these young men to such consideration of legal questions; the second year was worth the while. Of Elihu Root's work as a lawyer in New York much has been well said elsewhere.

He always kept in close touch with his boyhood home on the Oneida hills. He was deeply, tenderly attached not only to the home, but to the county and town of the college, and especially to the Greek letter fraternity—the Sigma Phi—to which all the Root kin have belonged save the elder Professor Root. Mr. Root was never demonstrative; like other "Roots of Badby," and like most of New England blood, his affection is reticent tho strong. Some years since Mr. Root purchased the place bordering the old home on the east. It is an old-fashioned house built about 1820 by Dr. Theodore Strong, then Professor of Mathematics at Hamilton. It had been the home in Elihu Root's boyhood of the Rev. Dr. Simeon North, then president of the college; during his college course it was

the home of the Rev. Dr. Anson J. Upson, then Professor of Rhetoric and Elocution. Much of the pleasure of young Root's life prior to his graduation was associated with the place, and he came into possession of a field not strange, but thronged with youthful memories. The place was put in order and from 1899 to 1903 was occupied by Mr. Root's elder son, Elihu, Jr., then a student in college. Recently the house has been much enlarged; connection with the college water plant gives ample supply and an electric company gives modern lighting.

Mr. Root has also purchased two farms joining the place on the south. The larger of these was the home farm of Dominie Samuel Kirkland and on it, just where the hill rises from the valley, stands the "Kirkland Mansion," where the patriot missionary spent his last days. All the land lies just to the west of the so-called "Property Line" of 1768, and was never formally under British rule. It was in the tract of a mile square given by the Oneidas to Mr. Kirkland—sanctioned by act of the State Legislature. It

comprises upland with considerable timber and rich lowlands along the Oriskany Creek, and is one of the best farms of the town. From its higher fields a wide view opens, showing the valleys of the Sanquoit and the Oriskany merging into the broader valley of the Mohawk.

When Mr. Root was asked what he was going to do with the farms he replied: "I think I shall come up some time and learn the trade." On his first coming some smiles were awakened by his seeking the "Spitzenberg" apple trees of the old orchard and his order that these should at once be trimmed and cared for. He recalled the shining ruddiness, the salmon tinted flesh, the rich, spicy flavor of the old-time winter apple.

Secretary Root and his family are now at the Clinton home. He and his children enjoy field and wood rambling and they tramp much.

The people hereabouts—farmers, townspeople, college folk—are all attached to Mr. Root and proud of him as well. They trust that he may here from time to time renew his youth.

CLINTON, N. Y.

The Study of Greek in American Colleges

BY ARTHUR TWINING HADLEY, LL.D.

PRESIDENT OF YALE UNIVERSITY

THIRTY years ago there was a clear distinction between the American college and the American scientific school. The former gave a classical education; the latter gave a technical education. The former required Greek; the latter did not. But in the last two decades the sharpness of this division has been broken down. Many of our scientific students have desired to pursue liberal studies as well as technical ones, and the scientific schools have met this demand by offering courses intended to promote general culture rather than professional efficiency. Many of our classical students have felt the necessity of laying the foundations for their professional study during the years of their

undergraduate life; and the colleges have met this demand by widening the range of subjects which the candidate for the degree of Bachelor of Arts may present. The course in arts and the course in science have become so much alike in their purpose that it is difficult to draw the line between them. Some educators have entirely abandoned the attempt to draw this line and would give the degree in arts for a scientific course as freely as for a classical one; all are ready to recognize colleges and scientific schools as co-ordinate parts of the American educational system.

As a result of these changes there has been a great reduction in the proportion of college students who learn Greek.

This is not because the actual number of those who study Greek has diminished, but because the conception of what constitutes a college student has widened. It is not that fewer men are taking Greek as a means of liberal education, but that more men are trying to get a liberal education without it. The reduction in the number of classical students who elect Greek is slight; the increase in the number of scientific students who elect Latin and modern literature is overwhelming.

The existence side by side of two groups of candidates for the Bachelor's Degree, similar in their social antecedents and aims, one of which studies Greek and the other does not, gives us an important means of judging the merits of the arguments which have been urged for and against that particular study.

The advocates of Greek have told us that this subject had a wholly exceptional value as a means of general culture and mental discipline. Greek civilization was something so important and so distinctive that a man who knew this civilization and its products at first hand had a breadth of historical understanding which could not be obtained in any other way. The Greek language was something so complex and so precise that it surpassed all other school studies as a means of training the student in habits of hard work and accurate thought. Either of these arguments by itself, they said, would justify the time spent in the study of Greek; taken together they furnished an overwhelming justification. On the other hand the opponents of Greek have urged that there was no very essential difference in the kind of culture or discipline which could be obtained from Greek and that which could be obtained from any other study. They have said plainly that for the great majority of pupils Greek was neither useful nor interesting; that with a little rearrangement of our courses we could just as well get our discipline from something that was interesting; and that any change in this direction would show economy of time and gain in efficiency.

When the matter came to a practical test it was found that the arguments of each side contained a combination of truth and error.

It was a severe disappointment to some

of our educational reformers that the boys who came to college with substitutes for Greek, which were useful and interesting, did *not* generally have the needed mental discipline and power of precise thought. The "literary" or "select" courses of twenty years ago were places of intellectual dissipation rather than of intellectual work. The boys who had learned to talk French and make scientific experiments might have been much interested in their studies at school, but they did not show a corresponding power to pursue their subsequent studies at college. The reason for this gradually became obvious. If a boy studied French because it was useful for him to talk French, or studied science because it was interesting for him to ascertain scientific facts, the teacher was tempted to put the usefulness and interest of the study into the foreground and let insistence upon laborious effort and accurate result fall into the background. A boy who talked French tolerably well but was inaccurate in his constructions was not nearly as efficient, in college or afterward, as the boy who read Greek with a good deal of difficulty, but was precise in his knowledge of the grammar as far as he went. The fact that Greek was hard to learn and of little practical use when learned guarded the teacher against the peril of making ease of attainment and facility of use the primary goals of his effort. It prevented him from letting his teaching degenerate into a process of cramming for certain expected needs of life; it compelled him to treat it as a process of discipline to prepare the pupil for any needs that might arise. "If I want a college graduate in the employ of my railroad," said a general manager of one of our largest systems, "I want a boy who has learned to use books hard and use them accurately; and I feel surer that he has learned that lesson over a Greek dictionary than over almost any other book that exists, because there is so little temptation to use a Greek dictionary in any other way."

This, however, was said more than ten years ago. Of late we have found that by insisting sufficiently upon high standards of accuracy and precision we can avoid the dangers which are incident to the study of modern language and

modern science. The teacher who is impressed with the utility of easy reading of languages and of facile performance of scientific experiments may tend to chafe at the college which requires the grammar of French or German to be treated as seriously as the grammar of Latin or Greek, and which refuses to allow knowledge of facts to take the place of knowledge of mathematics; he may complain that it is made harder for him to get boys into colleges on modern languages than on ancient ones, but sooner or later he will adapt himself to the situation and will train pupils in the new subjects with the same unpleasant care which was bestowed upon the old.

The advocates of Greek were right in saying that hard work and precision of thought are far more important than the immediate interest or utility of the subjects taught. They were wrong in saying that Greek stood apart from all other subjects as a means of educating the student to these habits of work and precision. If French is taught as carefully as Greek it seems to serve the disciplinary purposes which Greek formerly served. The only difficulty is that there are as yet relatively few teachers who make French a means of mental discipline, and that those who think they

teach it best are often the ones who really teach it worst, because they let apparent proficiency in speech conceal the lack of real training in thought. Wherever the old-fashioned arguments against Greek are regarded as true it will probably be desirable to study Greek, because very few people will teach anything else properly. But when once the error of those arguments is recognized the special need for the study of Greek will have gone, and other things are likely to be substituted.

It seems quite clear that this process of substituting other studies for Greek has fairly begun and is likely to continue steadily. But it is, I believe, also clear that the college education of the future will emphasize the kind of things for which the advocates of Greek stood in the past, rather than the kind of things for which the opponents of Greek stood; that it will introduce, in place of Greek, studies which are chosen for their power as means of mental discipline and mental culture rather than for their immediate interest or utility; and that it will defer to as late a period as possible in the technical training of the student the attempt to make the practical usefulness of a subject the criterion of its educational value.

NEW HAVEN, CONN.

The Imperial Family of Japan

BY JIHEI HASHIGUCHI

THE Imperial family of Japan may be likened unto the moon in a cloud-dotted sky. The moon appears and disappears, according as it stands against the clear sky or passes behind the overshadowing cloud. The Imperial family of Japan, during twenty-six centuries of the Japanese Empire's existence, has been in actual control of Government only when there was no Minister of State or "Shogun," whose influence overshadowed theirs.

As a fact of history, there have been altogether too many of such influential Ministers or "Shoguns" to permit the Imperial family to exercise actively their royal prerogatives. Only in the earlier

period of the Japanese history do we find the record of the latter holding firmly the rudder of the Ship of State. For the remaining period Prime Ministers and "Shoguns" have been in actual possession of power, the Imperial family only retaining their name and making occasional meteoric appearances during the intervals in which the power was transferred from one Ministerial house to another and from one "Shogunate" house to another.

It is, indeed, a mystery how the Imperial family could even hold the nominal position in those circumstances. The only explanation is the fact that the Japanese have been extremely loyal to

EMPRESS HARUKO

EMPEROR MUTSUHITO

the Imperial family, so that to ignore them altogether would have been a political death for the powers that were. Thus, the members of the Imperial family have been held in reverence due to gods, as if they were somewhat above the ordinary run of humanity. In common parlance, they used to be called "unjo bito," signifying "men above the cloud," which, indeed, very well characterizes them. The phrase originally signified that the Imperial family are the heaven-descended race, which is an "authenticated" fact of history.

As the matter of natural consequence of the circumstances above cited the "unjo bito" out of power used often to lead a pitiable life. While their sphere of influence was ethereal, their bodies were on earth. Yet they had only nectar and ambrosia to subsist upon. The "Tokugawa Shoguns," whose government has been overthrown in 1868, had been on the whole more liberal in making allowances to these demi-gods than any other "Shoguns" in the past. But the condition of life of these august "unjo bito" had been anything but prosperous. The princes and the princesses, as soon as they grew to be old enough to

learn anything, had been obliged to go to the Buddhist temples to lead the spiritual life, more on account of the lack of funds on the part of their parents to educate them otherwise than on any other account. The Mikados, themselves confined within the ancient palace in Kyoto, doing nothing special beyond offering morning prayers before the altar of their ancestors or taking hours daily in muttering the monologic rituals before the temple of Buddha, were not enviable by mortal men.

Their political influence, therefore, might not have been sufficient to overthrow the Tokugawa Government had it not been for the fact that the tyranny of the latter became so very repulsive to the majority of the three hundred daimyoes that these finally allied themselves together with the sixteen-year-old Prince Mutsuhito, the present Mikado, as their leader against the oppressor. It was fortunate for the "unjo bito" that such was the situation. The Mikado, to whom now the power was reinvested, was a young man who inherited his dead uncle's fortune, of which he had known very little until it was given to him.

The yearly allowance of the Mikado, which is at the same time that of the whole Imperial family, was increased many times over—it is now \$1,500,000. Besides, he has the yearly incomes of \$500,000 from the interest on the \$10,000,000 which was given to him from the war indemnity received from China ten years ago; of \$250,000 from his private estates, which amounts to \$5,000,000 or more; of \$500,000 from the forests, covering an area of 5,124,873 acres and valued at \$512,487,300, at \$100 an acre; in all, \$1,250,000. Thus, his yearly net income amounts to \$2,750,000. The princes and princesses have been recalled from the Buddhist temples and were educated under the proper tutors. The former habit of frugality was somewhat modified. After the evacuation of Yedo, now Tokyo, by the Tokugawa Shogun, the Mikado removed from Kyoto to Tokyo, to occupy the magnificent castle of Chiyoda, which has been built by the Tokugawa Shogun and which well behooves the dignity of the ruler of Japan.

There are in all 60 members in the Imperial family, inclusive of 11 married and 4 widowed princesses, who are members of the family by marriage, not by birth. Of the rest there are 11 married and 16 unmarried princes, inclusive of the Mikado, and 18 unmarried princesses.

The Mikado.

His Majesty, the Mikado Mutsuhito, was sixteen years old when he came to the throne, in 1868. His father, Komei-Tenno, had been a man of enthusiastic temperament, ambitious to regain the power which was withheld from him by the Tokugawa Shogun. He set afoot the anti-Tokugawa movement, but died without seeing the results of his movement.

Prince Mutsuhito inherited some of the characteristics of his father. Young tho he was, he already then possessed the quality of a man of leadership. He is enthusiastic, industrious and enlightened on all matters pertaining to the State, while he is magnanimous and tolerant, never showing an arbitrary disposition. Had he been a man of arbitrary disposition his sovereignty might have been repudiated at the very begin-

ning of "Meiji," for then his influence had not yet been established, while the extreme democratic principles had been already imported from France and not a small number of the people of Japan were the advocates of the change of the form of government into a republic.

The first thing the Mikado has done, immediately after his accession to the throne, that has any important bearing upon the history of "Meiji," the Era of Enlightenment, is the proclamation of an edict of five articles, which at once expressed strongly the liberal-mindedness of the Mikado and directed the course of the national development:

"1. Councils of men shall be encouraged throughout the country, and the affairs of State shall be administered in accordance with the public opinion.

"2. All men, whether of high stations of life or of low, shall with the united mind look after the welfare of the country.

"3. From the civil and the military officers to the general public, all shall have the satisfaction of their minds, so that no one shall have any cause to complain.

"4. Old order of things inexpedient shall be removed from us and the laws of the universe shall be obeyed.

"5. Knowledges shall be sought in all the world in order to strengthen the foundation of our Empire."

At the same time the Mikado sent the following message to the nation, appealing to their loyalty to him:

"I, the young Mikado, am day and night taking pains in deliberating upon the problem how to place our Empire on equal footing among the Powers of the world and how to fulfil the will of our ancestors.

"Since the power of our ancestors began to decline in the Middle Ages our military governors ('Shoguns') have exercised arbitrary influence.

"The latter held the former openly in reverence and secretly at distance, so that the parents of the nation that our ancestors were have not known the love of their children, and the Mikados of the nation only held their name and in reality lost their dignity. . . .

"In the earlier period of our Empire our ancestors used to take active part in the Government. Thus, they could administer the State affairs in a simplest manner; the relation between them and the people was most cordial, without undue formalities. . . .

"If you maintain the customs of the immediate past and think that you can serve me

by paying me reverence only, forgetting the present critical situation of our Empire, and if, whenever I raise my feet, you tremble extremely, thereby creating various suspicions and whisperings to my great embarrassment, it would conduce not only toward my failure as Mikado, but also toward my loss of the Empire of our ancestors, etc. . . ."

Soon afterward the feudal daimiate system was abolished and the country was divided into as many prefectures, with

vival of the fittest, to-day the former daimyos retain hardly any practical political influence.

When the Constitution was revised in 1889 the power of the Mikado was limited in the seventeen articles of its first section, while he has a partial legislative power as defined in the fifth and the first half of the eighth articles, which read as follows:

"Article 5. The Emperor shall exercise the legislative power with the counsel of the Imperial Diet.

"Article 8. The Emperor, in order to the maintenance of the public welfare and the protection of the public from the unexpected calamities, may issue extraordinary decrees in place of laws in case the Diet is not in session and the affairs demand immediate action. . . ."

CROWN PRINCESS
SADAKO

CROWN PRINCE HARUNOMIYA

the governors appointed by the Mikado, as there were daimiates. The transference of power from the daimyos to the centralized government was not without being attended with some resentment on the part of the former, who were to lose thereafter all their former prestiges. But on being appointed as the newly created governors of the respective prefectures of their former jurisdiction they acquiesced in the arrangement. It is to be remembered, therefore, that these daimyos did not expect to be ousted by the influential men among their former retainers. Yet, on account of the sur-

His legislative power is curtailed by the second half of the eighth article, which reads:

"These decrees shall be referred to the Imperial Diet in its immediately next session for approval, and if the Diet disapprove them the executive department shall declare that they shall not be effective thereafter."

Indeed, the Mikado stands in a peculiar position. For his actions he is not re-

sponsible, but the Ministers of the Cabinet. And even the course of his actions is largely determined by the privy council and the council of the Imperial princes of age, in which he exercises but a very little of his personal influence. Throughout his career as the ruler of Japan the Mikado has never even delivered a public speech, except once when he opened a session of the Diet some years ago. Neither has he ever made any original recommendation to the Diet. Even the Imperial messages, which are in themselves very excellent literature, are the works of the Imperial advisers, such as the Marquis Ito or Marquis Yamagata, etc. The Mikado reads them and signs them. But he is very precise in dealing with the bills passed in the Houses of the Diet, which need to be examined by him carefully before they are returned to the Cabinet, through which they are presented to him. Once the Minister of Finance sent in a report in which there was an item that was disproportionately small. The Mikado did not return it until the Prime Minister went in and carefully explained the item.

The Mikado is industrious. He rises early in the morning and performs his official duties all day for many hours.

Especially in these days, when the war is going on between his country and Russia, he sacrifices much of his usual pleasures. It is customary for him to visit Kyoto once a year. But last year he gave up his trip in order to devote the time to the official matters.

The Mikado is an intelligent man, well educated. It is said he is erudite enough for a degree of Ph. D.

The Mikado is six feet tall. He is one of the tallest men at his Court. He is stout, broad-shouldered, and he weighs two hundred pounds. His countenance has an expression of an athlete, which is not represented in his photographs that are made public. These are somehow or other tampered with by the overzealous photographers, who forget that the natural expression is the best expression of a man.

The Mikado's love of his country and his subjects is something extraordinary. He devotes a fixed sum out of his yearly allowance to various charity purposes. Whenever any accident happens in the land he at once orders a portion of the fund to be used in relieving the distressed families. He sends his messengers often to the hospitals to inquire after the health of the soldiers and sailors who have been wounded in the war.

PRINCESS TSUNENOMIYA

PRINCESS KANENOMIYA

PRINCESS FUMINOMIYA

PRINCESS YASUNOMIYA

PRINCE MICHINOMIYA

PRINCE ATSUNOMIYA

TWO SONS OF CROWN PRINCE AND PRINCESS

The Empress.

Her Majesty the Empress Haruko is fifty-six years old and is two years senior of her husband. She is one of the most beautiful women in Japan. She is a daughter of the late Prince Ichijo, who had been one of the courtiers of the Imperial family. As she is older than the Mikado she has been able to give her motherly care to the Mikado during all these years of Meiji. But as is usual, a woman in such a position is apt to miss something that is peculiar to the ordinary married relation, wherein the wife is younger than her husband and is looked upon by him with a sort of compassion. By no means, however, is she neglected. On the contrary, the couple love each other dearly, altho they do not usually go together when they go out. It is publicly denied that she is jealous of her rival, altho it is a fact that the Crown Prince Harunomiya is not Her Majesty's son, but His Majesty's.

She is an earnest worker for the Red Cross Society. Since the war began she has been making bandages with her own

hands. Whenever a large number of wounded at the front is reported she asks whether the bandages are sufficiently supplied and works harder than ever. How enthusiastic she is in carrying comfort to the sick and wounded in the hospitals can be judged from the story told of her. Once she made an appointment to visit a Red Cross hospital in Tokyo. The day happened to be very stormy. But, regardless of the remonstrances of her attendants, she fulfilled her appointment.

She is nominally the mother of five Imperial children, one of whom is the Crown Prince Harunomiya, the other four are the Princesses Tsunenomiya, Kanenomiya, Fuminomiya and Yasunomiya.

Crown Prince Harunomiya.

The Crown Prince Harunomiya is the third son of the Mikado. His two elder brothers having died early, he has been proclaimed the Crown Prince ten years or so ago.

He has been educated in the Peers' College in Tokyo. When he was a boy he was unmanageable. A professor of

Chinese literature, who used to give private lessons in the Chinese classics (which include Confucius's Book of Precepts) in the palace, was a stern disciplinarian. One day Prince Harunomiya refused to receive the lessons from the professor, because he takes the higher seat in the room than himself, who is the Crown Prince. The professor said: "I am taking the place of Confucius in teaching you the Book of Confucius, Your Highness. Confucius is above his scholars, whether they are ordinary men or Imperial princes." But the Crown Prince did not acquiesce, and the professor had to resign. He was afterward decorated highly by the Mikado.

When the young Prince was in the Peers' College he was a terror to the young fellow students, who, being sons of the feudal daimyos and other notables, had to submit to him in any quarrel, no matter whether he was right or wrong.

The Crown Prince is a daring young man. He used to like to practice the art of war, exposing himself in the sun or rain, never mindful of the contrary advices of his attendants. As a consequence, he has developed into a good horseman. Now he holds the honorary title of Colonel of the Imperial army.

He is reported to be an intelligent man. He studies now daily under his tutors. He may become a very good Mikado if he keeps on studying hard. His one drawback is the condition of his health. He is a consumptive and is often attacked by illness. Recently he has improved a great deal, and it is hoped that, with the advices of his physicians, he will be completely cured of his illness.

It was once arranged that he marry the daughter of Prince Fushimi. But on account of the close blood relationship they were not married. He then married Sadako, a daughter of a courtier. He is now twenty-six years old and is the father of three children.

Crown Princess Sadako.

Crown Princess Sadako is the fourth daughter of Prince Kujo, a courtier of the Mikado. She was born in Kyoto in 1884, and is therefore twenty-one years old, five years younger than her husband.

Her youthful career illustrates how sensible a woman she is. Her childhood days were spent in Kyoto. After she finished her preliminary education she entered the Peers' College for women in Tokyo, where she studied diligently, attending to school with clock work regularity. During one school term she never missed a day in attendance. In going to and in coming back from the school daily she never imitated the extravagant daughters of the "Kwazoku" (the lords), her schoolmates, who employed carriages and jinrikisha. She would walk back and forth the distance of a mile between her home in the Fukuyoshicho in Akasaka Borough, to the college, which is in the Kojimachi Borough. Sun or rain, she was just the same. On rainy days if her attendants advised her to employ kuruma ("jinrikisha"), she would say: "I prefer to walk," and so did, wearing a pair of "takaget" (high shoes for rainy season), and carrying a rainy day parasol.

Besides being sensible, she is a healthy, robust woman, possessing a most charming grace that would attract any man's heart at first sight. Thus she became the object of the gallant heart of Crown Prince Harunomiya, who courted her in the modern European style of free love-making. They were engaged in 1899 and were married in 1900.

Eleven months after their marriage a son was born, who was named Prince Michinomiya. In the ensuing year another son was born, who was named Atsunomiya. This year another son was born.

The daily life of the Crown Prince and Princess is led in a most enlightened manner of the twentieth century. Seclusion, which might characterize the life of the Mikados and the other persons of the Imperial family of old, is not that of our future ruler and his consort. Their palace is located in Aoyama, beside their Imperial father's Aoyama resort. It is in a grove on an eminence away from the din of the streets of the city of Tokyo. They live in that palace a greater part of the year. In winter they go for a short time to Hayama for a winter vacation. In summer they go to Mikko, Shiohara, Hakone, the beautiful summer resorts.

They rise at 7 o'clock every morning. The attendant physician looks into the condition of their health. He takes the weight of their bodies and the couple take a delight in comparing their weight of a day with that of the previous day. They dress in a European style. At 8 they take breakfast, which is a very simple affair, consisting principally of milk and bread. After breakfast they take a walk in the yard or read newspapers until 9 o'clock, when they be-

3 p.m. they take light cakes and coffee. At 3.30 Prince Harunomiya takes exercise in horse riding at the riding ground near the palace. Princess Sadako usually accompanies him to watch him exhibit the art of horsemanship.

Supper is served at 6 p.m. in a Japanese style. The food cooked is carefully examined by the attendant physician, who writes a bill of fare, which he sends to the Princess. The latter looks over the bill of fare and orders now this food,

Grandchildren of the Emperor of Japan at Play

gin their daily lesson under their tutors. When they go to see their Imperial father and mother, they leave their palace at 10 o'clock. The dinner is served at 12.30. First they have a chat in the dining room. They have waitresses, but most of the waiting is done by the Princess herself. Their dinner consists of eight different kinds of European dishes. Sometimes the Princess Sadako prefers the Japanese dishes to the European ones. She used to order them often, until some time after she was married. Now she takes the Japanese dinner at noon seldom if ever. After the dinner the couple take a walk in the yard. Later they enter their afternoon lessons. At

now that, according as she thinks the food may suit the daily condition of her husband's health as well as her own. Eighteen different dishes are served. It is said Princess Sadako's taste is simpler than that of her husband. Prince Harunomiya takes a little port wine at supper, but Princess Sadako never touches wine.

In the evening they change their dress to the Japanese style. At night the Princess plays the Japanese and the Western musical instruments, which the Prince enjoys immensely. At 9 they go to bed.

A story is told of Princess Sadako in reference to her kindheartedness. In

Japan every subject of Mikado is under obligation to salute most respectfully any member of the Imperial family. Any one who fails to do this is considered as a disrespectful subject. A civilian must observe the custom; much more must the officers and men in the army and navy.

One day an officer of the guard of the Crown Prince's palace, with a number of his men, was strolling along the garden of the palace. Presently they were met by the Princess Sadako and her maiden companions, who were taking a walk. The officer ordered his men to halt, to face front and to salute her most respectfully. They parted and again they met in another quarter. The officer was about to repeat the order to his men, when the Princess sent her attendant maid to tell him that he need not repeat. The officer and the men were deeply impressed with the kindness of the Princess Sadako.

The two elder children have been brought up in the house of the late Count Kawamura. They were attended by two physicians and a Red Cross nurse, while the Countess Kawamura took a motherly care of them. The Princes used to call the Count Kawamura "Uncle Kawamura." Count Kawamura's house being near to the thoroughfares, the young princes came to learn the words the newspaper boys use in selling extras on the streets. Thus, they would get hold of newspapers and run about in the garden, yelling: "Gogwai! Gogwai!" "Extras! Extras!"

After the death of the Count last year his son, Tetsutaro, respectfully declined the honor of guardianship of the Princes, who forthwith returned to their parents' home.

The elder one, Prince Michinomiya, will be educated in a military school, the

younger, Prince Atsunomiya, in a naval school, when they grow up. The former will be heir to his father; consequently, he will be the future Mikado after the expiration of the term of his father's office as Mikado, provided that no son shall be born to the present Empress; for in that event, the Prince Michinomiya being the son of an illegitimate son of the Mikado, the son of the Empress will inherit the throne after the Crown Prince, according to the provisions of the Imperial Household Ordinances, the fourth article of which says: "In succeeding to the Imperial throne, the legitimate sons or grandsons shall take the precedence of the illegitimate, and the latter succeed to the throne only when there is no legitimate son or grandson." But it is scarcely likely that a son be born to the Empress Haruko.

It is not given to the people of Japan to know much about the persons of the young ladies of the Mikado's family. They do not go out freely, as their brothers and cousins do. We learn their sentiment through the poems of their production, which are occasionally made public in the columns of newspapers. Lately, however, they made one or two excursions to town to see the soldiers depart from the Shimbashi station for the front. It is said that the two elder Princesses, Princess Tsunenomiya (18 years old) and Princess Kanenomiya (16 years old), are deeply interested in the welfare of the country and of the men at the front, so that they keep every name of the killed and wounded soldiers and sailors in their memoranda. They buy extras whenever a boy comes round their palace to sell. As for the younger Princesses, Princess Fuminomiya and Princess Yasunomiya, they, too, know well in what condition their country is to-day.

NEW YORK CITY.

The Future of Teachers' Salaries

BY W. T. HARRIS, LL.D.

⁴[One of the most important addresses delivered at the recent meeting of the National Education Association at Asbury Park was the following discussion of teachers' salaries by the United States Commissioner of Education.—EDITOR.]

THE first question of interest to the teacher inquiring about salaries is: Are the positions of teachers in a State annual positions or merely temporary occupations lasting only for a small fraction of the year? The annual position means a teacher employed by the year who takes up teaching as a vocation and does not have to shift to other occupations to eke out the salary received from his vocation as teacher.

The second important question is: How many well paying positions are there—how many positions are there in the teachers' ranks which promise the individual, successful in his profession of teacher, an increase above the position he at present occupies, say to a salary one-fourth larger, or one-half larger—how many positions will open to him that are twice or three times or four times what he receives now when he first enters the profession? The ambitious teacher wishes to have a career before him.

Another aspect of the question is this: Do the positions commanding high salaries increase in number as fast or faster than the population? Pretty much all the interest in statistics of salaries in the United States, therefore, relates not to the salaries of rural schools, but to those paid in village or city schools which are sufficient to support a professional teacher and to the question whether there are a sufficient number of higher positions to hold out a promise to the lower teacher of promotion from time to time in accordance with the increase of his professional skill.

I am therefore glad to mention here that the average annual increase in higher education throws open nearly one thousand new places a year in colleges and universities for teachers promoted from the secondary schools on being found to have the requisite skill and

scholarship. There were in 1890 7,918 professors and instructors in the colleges and universities of the United States, not counting the professional schools. In 1903 the number had risen to 20,887. It started with less than 8,000 and has had an increase of new places for thirteen years almost equal to one thousand a year (12,969). Besides this the increase in new places in the secondary schools of the United States has been somewhat more. The High Schools and Academies counted 16,329 teachers in 1890, and in 1903 counted 33,795. This increase gave 17,466 new positions in thirteen years—1,340 a year—for teachers in public and private high schools.

The teacher whose salary is low asks himself what he is going to do about it. He may submit in sorrow to his lot or he may take a more heroic view of the matter and consider that his lot will depend in large measure upon his own efforts. He will then try to improve his skill in teaching and to make his field of learning more extensive and accurate. He will make enthusiastic culture studies in literature and art as well as in science. He will study to perfect himself in fine manners.

I find that while by far the larger part of the population is counted in the lower occupations the talented and able workmen in the lowest rank of industry have a constant demand upon them to furnish recruits for the occupations that require more skill and offer a substantial increase in salary.

What may be called the higher occupations, which have to do with protection and culture, increased with a considerable degree of uniformity in the thirty years ending in 1900, showing an increase from 30,000 to 44,000 in each million.

Professors and teachers were counted by the census in 1870 at 10,141 in each

million, but the quota of 1900 in each million is increased to 18,509, an increase faster than the population, giving one new place to each 120 persons.

Is the vocation of teacher a permanent one which will grow into greater consideration with our people during the entire period in which they make progress along the lines of the conquest of nature and the conversion of things and forces to the rational purpose of supplying the wants of man?

I have named the vocations that provide means of creature comfort and the means of protection as belonging to the higher order of occupations. It will be seen at once that these vocations involve capacity and that they receive higher wages than the employments of the lower order. There is a third and last division of this higher order of vocations, including employments of that portion of the community engaged in providing the instrumentalities of culture for the people. I include in this list first those engaged in religious work of various kinds and next the artistic trades that supply ornament on useful goods and produce works of sculpture and painting and music, literature, the formation and care of art museums, and besides these three more larger classes of workers in this higher order of occupations—namely, school teachers, librarians and the purveyors of intercommunication. The corps of teachers in public and private schools numbers something over half a million, the public school teachers alone numbering upward of four hundred and fifty thousand and the private teachers of all kinds numbering about one hundred and twenty thousand more; the curatorship of libraries contains a rapidly increasing list of occupations, and the list of occupations which include the people engaged in collecting and diffusing information by the daily or weekly newspapers, magazines and books, operating telegraphs, photographic and photo-engraving establishments—altho this class is at present not one-half as large as the corps of teachers in the United States, it is destined to be much larger as urban life comes to supplant rural life.

These classes of workers, belonging to the higher order of occupations, are destined to grow in size with the advance of

civilization and the increase of production in wealth. I include in this list especially those employed in the pursuit of science and the invention of devices useful in the arts.

In the earliest stage of civilization ninety-nine laborers out of each hundred are needed to supply raw material and rude manufactures for the community. With the growth of civilization a larger and larger number are detailed from the one hundred to provide creature comforts, protection and culture, and the teacher's vocation in the United States at present by far leads in numbers the other vocations that have to do with providing culture for the community. These vocations are limited in their quotas only by the ability of the community to furnish a surplus of money beyond what is needed for the raw materials and the rude manufactures for food, clothing and shelter. In the future time a goal will be reached when one person in each hundred by means of machinery will furnish all the food, clothing and shelter needed for the other ninety-nine, and every one of these ninety-nine will find ample employment in the higher occupations which provide means for creature comfort, protection and culture.

The increase of lucrative occupations in the professional classes who furnish protection for life, health and property assists by competition the increase of salaries for teachers by drawing their supply of workers from the higher educated classes.

The recent canvass of the salaries of teachers by the special committee of which Colonel Wright, the chairman, makes report this year, gives us data from which we may complete our list of better salaried positions in schools, besides those in colleges already named, counting in superintendents, assistant superintendents, high school principals, elementary school principals, high school teachers (not principals), elementary school teachers, six classes in all, reported from 467 cities of over eight thousand inhabitants.

This list aggregates 53,554 positions with annual salaries of \$600 and over, one-half of which pay \$800 and upward, besides 14,193 of \$500 to \$600, and 17,728 annual salaries below \$500.

I stop at salaries at \$600 as the lower limit, because he who receives \$600 per year receives more than his quota of the total production of the United States (the total income of the nation in 1900, made on a liberal basis, being only \$551.56 per inhabitant, if divided among the entire number of persons working in a gainful occupation, twenty-nine millions of them in all. In this estimate I do not set aside anything for the rent of real estate, nor anything for the interest on capital, nor anything for the extra pay of the organizing and directing power which contributes so much toward the increase of the production of wealth.)

No teacher has a right to complain, on a socialistic basis, if he is receiving a salary for his annual services of six hundred dollars.

Teachers of rural schools for three or four months in the year are not an important element in this discussion of salaries. Teaching as a makeshift occupation can never be of sufficient importance to cause young men and women to spend years at training schools in preparation for that work. Only places with annual salaries and with eight to ten months of teaching will warrant the establishment of normal schools and the requisite time of preparation necessary to secure the special qualification of the professional teacher.

The salaries that average below \$600 cannot be named as attractive for the professional teacher except as a beginning, a period of probation. Salaries of \$600 begin to be attractive to the person who belongs to the rank of mechanical wage earners and feels an ability and a desire to undertake a career that promises more honorable service and a higher salary than the mechanical occupation which he finds ready to his hand. The professional teacher demands a permanent vocation at living wages, as I have said, with plenty of higher positions for him with advanced wages as a reward for his increase in skill and culture.

There has been an increase of accumulated wealth from decade to decade in the States. The total amount of wealth per individual in the United States amounted in 1900 to \$1,235 (estimate made by Chief of Bureau of Statistics United States Treasury for World Al-

manac). In 1850, according to the United States Census, the total per capita of wealth per inhabitant on its true valuation was \$308 per inhabitant, and decade by decade it rose to the following sums: 1860, \$514; 1870, \$780; 1880, \$870; 1890, \$1,036. It appears therefore that each individual in the United States has an average of four times as much realized wealth as in 1850 and therefore can bear a burden of taxation equal to four times that of 1850 with greater ease, because the greater the income from vested property the greater the tax possible without stinting the individual in his necessities.

The average amount earned per individual by the persons reported in the census as having a gainful occupation increases from year to year with the increase of realized wealth. Realized wealth may be considered as capital for the production of property. The individual therefore, if reinforced by a large amount of realized wealth, is able to produce more more per annum.

According to the census the average person having a gainful occupation in 1850 produced less than \$500 (\$484.80); in 1860, \$651.48; in 1870, \$849.03; in 1880, \$721.93; in 1890, \$990.32; in 1900, \$1,065.69. This scale corresponds substantially to that of the per capita of wealth. The larger the sum produced by the average person in the United States the greater his ability to support schools and furnish positions of large salaries for the highest order of teachers. These figures, therefore, showing the increase of productive power on the part of the individual wage-earner in the United States are full of hope for the future of the teacher as regards his salary and his social position.

Science makes possible mechanic invention and it makes possible also the use of the forces of nature to reinforce human power and furnish a substitute for the power of domestic animals. This progress in the reinforcing of the human might as it goes on from year to year increases, as was expected, the wealth producing power of the individual. It would seem that in fifty years, from 1850 to 1900, the wealth producing power has more than doubled. From 25 cents per day per

capita it has now risen to 58 cents in the United States. All countries show increased power of wealth production in proportion as they adopt labor-saving machinery, but few of them to the extent of the United States.

The future of teachers' salaries is

therefore a bright and promising one viewed in the light of the general industrial progress, but a far more hopeful one viewed from the economical law of increased values for vocations that have for their object protection and culture.

WASHINGTON, D. C.

Together, July 9th

BY SIR LEWIS MORRIS

'Twas a bright Sunday morning in summer
When a poor father, loving and mild,
Freed at last from the long week's labors,
Went forth with his little girl-child.

A weak cripple, whose labor-worn frame
Cruel Fortune had bowed to the ground,
With steel braces strengthened and bound,
Tho they left him infirm and lame.

For both 'twas a long-promised pleasure,
When the pitiless springtide was done
And the crested grass waved in the meadows,
Grown tall 'neath the fostering sun.

Now 'twas come, and there rose not a cloudlet
On the face of the limitless sky;
And the little maid, kissing her mother,
Waved smiling a long good-by.

And now from the long dusty suburb
Through green fields and woodlands they
went
Hand in hand, the slow laboring father
And the wondering innocent.

So they roamed on, taking their fill
Of joy, heavy laden with flowers,
Half forgetting the fugitive hours,
Till 'twas time to descend from the hill.

Then sudden the heavens around
Were o'erspread with a sinister light,
And a rumble of ominous sound
Filled the father with deep affright.

Last the heavy drops fell, and they hurry,
Forgetting all else but their dread,
To gain a poor hut's low shelter
Ere the black storm broke overhead.

And gain it but, ah! it is crowded;
So without 'neath the broad eaves they
stand,
The young child and the crippled father,
'Mid the lightnings, hand clasped in hand.

Till at last a great flash with such thunders
As if the high heavens were rent
And the hapless pair perish together,
Poor father and innocent.

'Twas the steel on his limbs which drew to him
The terrible sword of the sky,
And the same force that tore him and slew him
Bade his fatherless innocent die.

Not one mark on the fair little body!
Nay, 'twas best, oh! mysterious command
That slew sire and his young child together,
She clasping her father's hand.

PENRYN HOUSE, CARMATHEN, ENGLAND

The Educational Books of the Year

It takes at least two years for a teacher to get used to a new text-book, and after that he, or rather she, does not get more than another year or so of comfort out of it before her conscience, stimulated thereto by the suggestions of rival publishers, arouses her to question whether something better has not come out since. When she begins to "take notice" again, if we may use the phrase in this connection, she naturally wants a wide range of choice. It is to assist in this perplexing but important task of choosing that the following list of the more important educational books, published during the year, with brief suggestions as to their contents and value, is prepared. Many other educational books of a less technical character have been reviewed in the course of the year.

English

- Eclectic English Classics.* College Entrance Requirements in English: 1906-1908. New York: The American Book Co. 80 cents.
- Riverside Literature Series: The Faerie Queene.* By Martha Hale Shackford. Boston: Houghton, Mifflin & Co. 30 cents.
- Shakespeare's The Merchant of Venice.* By R. M'William. New York: Henry Holt & Co. 35 cents.
- Rolfe's Shakespeare.* King John. Antony and Cleopatra. The Taming of the Shrew. The Comedy of Errors. King Henry the Eighth. The Winter's Tale. Romeo and Juliet. Much Ado About Nothing. King Richard the Third. King Henry the Fourth (Parts 1 and 2). King Richard the Second. King Henry the Fifth. Edited by William J. Rolfe. New York: The American Book Co. 56 cents.
- Arden Shakespeare Series.* Henry IV, Part I, by Frederick W. Moorman. Boston: D. C. Heath & Co. 25 cents.
- Macmillan's Pocket Classics.* Andersen's Fairy Tales, by Sarah C. Brooks. Arnold's Sohrab and Rustum, by Justus Collins Castleman. Hawthorne's The House of Seven Gables, by Clyde Furst. The Odyssey of Homer, translated by S. H. Butcher and A. Lang. Carlyle's Heroes and Hero Worship, by Annie Russell Marble. Dickens's Christmas Carol, by James M. Sawin and Ida M. Thomas. Scott's Quentin Durward, by Arthur Llewellyn Eno. Out of the Northland, by Emilie Kip Baker. Old English Ballads, by William Dallam Armes. The Story of the Iliad and The Story of the Odyssey, by Alfred J. Church. Sermons of Jonathan Edwards, by Norman Gardner. Longfellow's Hiawatha, by E. J. Fleming. New York: The Macmillan Co. 25 cents each.
- Three Years with the Poets.* By Bertha Hazard. Boston: Houghton, Mifflin & Co. 50 cents.
- English Composition.* By Frederick Henry Sykes. New York: Charles Scribner's Sons. \$1.00.
- Argumentation and Debate.* By Craven Laycock and Robert L. Seales. New York: The Macmillan Co.
- The Principles and Progress of English Poetry.* By Charles Mills Gayley and Clement C. Young. New York: The Macmillan Co. \$1.10.
- Middle English Reader.* Edited by Oliver Farrar Emerson. New York: The Macmillan Co. \$1.90.
- Southern Writers.* By W. P. Trent. New York: The Macmillan Co. \$1.10.
- A Brief History of American Literature.* By William P. Trent. New York: D. Appleton & Co. \$1.40.
- The Development of the English Novel.* By Wilbur L. Cross. New York: The Macmillan Co. \$1.50.
- Gateway Series.* Henry Van Dyke, General Editor. Macaulay's Essay on Addison, by Charles Flint McClumpha. 35 cents. Milton's Minor Poems, by Marv A. Jordan. 35 cents. Tennyson's The Princess, by Katharine Lee Bates. 40 cents. Scott's The Lady of the Lake, by Raymond Macdonald Alden. 40 cents. Macbeth, by Thomas Marc Parrott. 40 cents. Coleridge's Ancient Mariner, by George Edward Woodberry. 30 cents. Tennyson's Idylls of the King, by Henry Van Dyke. 35 cents. New York: The American Book Co.
- First Folio Shakespeare: Hamlet.* By Charlotte Porter and Helen A. Clarke. New York: Thomas Y. Crowell & Co. 50 cents.
- How to Study Shakespeare.* By William H. Fleming. New York: Doubleday, Page & Co. \$1.00.
- Shakespeare for Recitation.* By Ernest Pertwee. New York: E. P. Dutton & Co. 60 cents.
- Shakespeare's Julius Caesar.* By William H. McDougal. New York: D. Appleton & Co. 30 cents.
- Briefs on Public Questions.* By Ralph Curtis Ringwalt. New York: Longmans, Green & Co. \$1.20.
- Selected Poems of Elizabeth Barrett Browning.* By Elizabeth Lee. Boston: Ginn & Co. 30 cents.
- Evangeline.* By P. H. Pearson. Topeka: Crane & Co. 25 cents.
- Goldsmith's Vicar of Wakefield,* edited by Louise Maitland. New York: D. Appleton & Co. 40 cents.
- The First View of English Literature.* By William Vaughn Moody and Robert Morss Lovett. New York: Charles Scribner's Sons. \$1.00.
- The Use of Words.* By Georgina Kinnear. New York: E. P. Dutton & Co. 30 cents.
- Elocution and Expression.* By Albert Francis Tenney. New York: E. P. Dutton & Co. \$1.50.
- Reading and Language Lessons.* By William E. Chancellor. New York: The American Book Co. 30 cents.
- Specimen Letters.* By Albert S. Cook and Allen R. Benham. Boston: Ginn & Co. 65 cents.
- Special Method in Language.* By Charles A. McMurry. New York: The Macmillan Co. 70 cents.
- Principles of Rhetoric.* By Elizabeth H. Spaulding. Boston: D. C. Heath & Co.

The supply of English material is about the same as usual. There is the usual number of texts, literatures, compositions and rhetorics—and that without particular change of character. It is discouraging to find the same texts re-edited year after year with no more appearance of finality than at first, while the selection of English literature for use in school is still so far from complete or representative. To compile a list of such duplicates as have accrued of recent years, would be in itself the most pertinent and scathing comment upon the

futility of this sort of advertising scholarship. And the case is the worse, because all this pretense is in one sense quite unnecessary. Such a collection of readings as the American Book Company publishes in the *Eclectic classics* and Dr. Van Dyke's *Gateway Series*, or Houghton & Mifflin in the several volumes of their *Riverside Literature Series*, with a minimum of comments and explanatory notes at the foot of the page, is quite enough for every practical purpose. Editions with good critical or scholarly introductions, which should exist in some quantity by this time, are, of course, another matter. Of these there are few or none with the exception of some further volumes of Rolfe's revised edition of Shakespeare. The best of the sort are perhaps Moorman's *Henry IV*, in the generally excellent *Arden Shakespeare*, and Armes's *Old English Ballads and Folk Songs*, with a pretty good summary of present ballad theory. Apparently there is a growing taste for poetry; and a sort of departure in this direction is represented by Miss Hazard's *Three Years with the Poets*, "a text-book of poetry to be memorized by children during the first years in school." The notion is a good one; there is no better means of cultivating the taste and developing a sense for literature. But the habit ought to be continued beyond the point where

the pupil can appreciate only the minor and slighter kinds of poetry.

The tendency among rhetorics is still toward an undue emphasis of the "artistic" or "creative" over the logical or intellectual theory. The effort for original composition at any cost has been a mischievous one and is likely to be yet more so, if persisted in. Such a book is Syke's *English Composition* for high schools. It contains an introduction with a clear statement of the belief now coming to be pretty generally held with regard to these matters and looks like a very fair specimen of its class, tho it exhibits much of the disorganization and confusion incidental to the method. Symptomatic of the same tendency is the constantly developing taste for debate and argumentation, tho this form of expression has an advantage over ordinary "laboratory" composition in demanding a knowledge of actual fact, a basis of information furnished by other studies. In this sort of work the revised edition of Baker's well-known book will probably continue standard; but those who wish a less exhaustive treatment in much the same manner will be interested in Laycock and Seales's *Argumentation and Debate*.

On the border line between literary history and method lies Gayley and Young's *Principles and Progress of English Poetry*. The value of the book

From Murray's "The Child at Play. Little Stories for Little Children." Boston: Little, Brown & Co.

is somewhat impaired by the unwise eclecticism which endeavors to adapt such publications to as many sorts and conditions of students and circumstances as possible no matter how incompatible their needs may be. But it is interesting and commendable by its attempt to connect the history and criticism with a knowledge of the literature, and to do so in particular for poetry. The authors are arranged chronologically; each is accompanied by a short account of his life and a criticism of the poems by which he is represented, as well as by a brief review of the character of his time; while every age or period is similarly introduced and the entire volume is preceded by an essay of a hundred pages on the "Principles of Poetry." With Professor Gayley's artistic theory we cannot always agree, nor does the manual seem by any means so scholarly as one of a somewhat similar nature published a year or so ago; but it has the great advantage of putting a large amount of poetic phenomena into shape for the student's use. In this connection also, altho detailed criticism is impossible, should be commended in passing, Emerson's *Middle English Reader*, containing wide and linguistically representative selections from the middle English dialects arranged from the point of view of the Midland, together with a grammatical sketch, a vocabulary and notes—as also another reprint of Cross's very successful *Development of the English Novel*, the best of its kind, no doubt, in the language. In the way of literatures there remains to be noticed Trent's *Brief History of American Literature*. Like his larger work, it is marked by some errors of perspective and emphasis, by a certain indiscriminateness and at the same time a curious timidity of judgment, and also by a peculiar dryness; but it shows also a rather unusual first-hand knowledge of the facts and an equally unusual orderliness and lucidity in disposing of them.

French

- Le Voyage de M. Perrichon.* By J. R. Effinger. New York: Henry Holt & Co. 30 cents.
Meilhac et Halévy's L'Été de la Saint Martin. By V. E. François. Boston: D. C. Heath & Co. 25 cents.
La Mare au Diable. By George Sand. New York: American Book Co. 35 cents.

- Anecdotes Faciles.* By O. B. Super. Boston: D. C. Heath & Co. 25 cents.
Histoires et Poesies. By M. M. Robique. New York: Wm. R. Jenkins. 50 cents.
Choses de France. By C. Fontaine. New York: Wm. R. Jenkins.
La Clef d'Or. By Jeanne Mairat. New York: American Book Co. 35 cents.
About's La Mère de la Marquise and La Fille du Chanoine. By O. B. Super. Boston: Ginn & Co. 50 cents.
La Neuvaïne de Colette. By Jeanne Schultz. New York: Wm. R. Jenkins. 60 cents.
Marguerite's Strasbourg. By Oscar Kuhns. New York: H. Holt & Co. 35 cents.
Standard French Authors. Selections by Othon G. Guerlac. Boston: Ginn & Co. 50 cents.
Chateaubriand's Atala. By Oscar Kuhns. Boston: D. C. Heath & Co. 30 cents.
Voltaire's Zadig. By Irving Babbitt. Boston: D. C. Heath & Co. 45 cents.
Tales of France. Edited by A. Guyot Cameron. New York: American Book Co. \$1.00.
Selections from Zola. By A. Guyot Cameron. New York: Henry Holt & Co.
Longer French Poems. By T. A. Jenkins. New York: D. Appleton & Co. 60 cents.
Grammaire Française. By J. H. Worman and A. de Rougemont. New York: American Book Co. \$1.00.
Simple Grammaire Française. By P. Bercy and G. Castegnier. New York: Wm. R. Jenkins. \$1.00.
Short Selections. By Paul Bercy. New York: Wm. R. Jenkins. 75 cents.
Le Livre Française. By Josefa Schrakamp. New York: Henry Holt & Co. 75 cents.

Among the lately issued French textbooks are to be found a few that have already gained favor with secondary school teachers, such as Labiche's and Halévy's plays and George Sand's delightful *La Mare au Diable*. New texts are comparatively scarce. Primary students have *Anecdotes Faciles* for beginning easy French reading, or *Histoires et Poesies*, which, we feel certain, will not see the light of a high school classroom. *Choses de France* is a discussion of French industries, history and institutions—perhaps a little too matter of fact. Fairy stories are represented by two tales of Jeanne Mairat, who holds a strong brief for the development of the romantic in the child-mind.

For advanced reading there are some excellent works: About's two vivacious and quaintly humorous narratives. A temperamental opposite of About is Jeanne Schultz, whose dreamily-reflective, melancholy-tinged *Neuvaïne de Colette* will draw forth the best powers of the teacher. The lack of vocabulary in the latter work is to be regarded as a defect. Students with a historical tendency have a sufficiently lively story in *Strasbourg*. The invariable book of selections is fated this time to be Guerlac's, a most voluminous one, praiseworthy for its breadth of choice and its excellent variety.

For the most advanced student there are the famous *Atala*, from the pen of the leader of the Romanticists, and *Zadig*, the most perfect *conte* of the eighteenth century; a worthy example of classical clearness and simplicity. The *conte* of modern times is represented in a series, prefaced by a most scholarly introduction on the history and significance of the *conte* in France. In the same thorough and enthusiastic spirit the editor of the previous work has performed a similar task with Zola, putting together some characteristic short stories and selections of his larger work—an idea commendable in itself as for the manner of its execution and the appreciative discussion of Zola's literary and social ideas. Of poetry there is only one volume; a serious collection, with an introductory essay on French versification, meant for the most advanced students of a college course.

The French grammars of this season are rather poor in quality, written in French—an insuperable difficulty in an English classroom. In general they are poor in arrangement and do not compare in amount, interest of presentation and practicability with the good grammars of Chardenal or Downer type, not to mention such as Frazer and Squair. They probably are meant for the private teacher's use. Bercy's short selections contain excellent pieces for translation, but lacks a crying necessity, a vocabulary. *Le Livre Français* appears at different stages an elementary grammar, reader and a dictionary arranged on grammatical lines—but a failure *in toto*.

German

- Gerstücker's Germelshausen*, by Lawrence A. McLouth. Sealsfield's *Die Prärie am Jacinto*, by A. B. Nichols. Meissner's *Aus Deutschen Landen*, by Josefa Schrakamp. Two German Tales, Goethe and Zschokke, by A. B. Nichols. New York: Henry Holt & Co. 35 cents.
- Heath's Modern Language Series*. Populäre Vorträge, by Hermann von Helmholtz. 55 cents. Storm's *Geschichten aus der Tonne*, by Frank Vogel. 40 cents. Gerstücker's *Irrfahrten*, by F. B. Sturm. Arnold's *Aprilwetter*, by Laurence Fossler. 35 cents. Zschokke's *Das Abenteuer der Neujahrsnacht*, by Charles H. Handschin. 35 cents. Mörike's *Mozart auf der Reise nach Prag*, by William Guild Howard. 35 cents. Boston: D. C. Heath & Co.
- International Modern Language Series*. Meyer's *Der Schuss von der Kanzel*. 35 cents. Ernst's *Flachsmann als Erzieher*, by Elizabeth

- Kingsbury. 40 cents. Goethe's *Hermann und Dorothea*, by Philip Schuyler Allen. 60 cents. Practical German Conversation, by Laurence Fossler. 60 cents. Zschokke *Der Zerbrochene Krug*, by Herbert Charles Sanborn. 25 cents. Boston: Ginn & Co.
- Schiller's Dreissigjährige Krieg. Drittes Buch*, by A. H. Palmer. New York: Henry Holt & Co. 35 cents.
- A Brief German Course*. By C. F. Kayser and F. Montser. New York: The American Book Co. \$1.20.
- Karl Heinrich*. By Wilhelm Meyer-Förster. New York: Newson & Co.
- Meyer's Das Amulett*, edited by C. C. Clascok. New York: The American Book Co. 35 cents.
- Bismarck's Speeches and Letters*. By Herman Schoenfeld. New York: D. Appleton & Co. \$1.50.
- Kleine Geschichten für Anfänger*. By Arnold Werner-Spanhoofd. New York: D. Appleton & Co. 40 cents.
- Idiomatic Study of German*. By Otto Kuphal. New York: George Gottsberger Peck.
- Deutsche Bildungszustände*. By Karl Biedermann. New York: Henry Holt & Co. 70 cents.
- A German Drill Book*. By Francis Kingsley Ball. Boston: D. C. Heath & Co. 80 cents.

Progress is the keynote of the German text-books of this year; fewer grammars, a careful selection of texts, some new and promising paths opened in the direction of deeper reading.

For beginners there are old favorites—*Aus Deutschen Landen*; *Geschichten aus der Tonne*, an introductory *Kleine Geschichten für Anfänger*, with notes perhaps too detailed for this stage of study.

The books of Intermediate German are most substantial. Among the "tried and true" ones are the charming *Germelshausen* and the humorously adventurous *Irrfahrten*; *das Abenteuer der Neujahrsnacht* and that truly Zschokkian tale, *Der Zerbrochene Krug*. A few able works that have found their way on the text-book field are two of Meyer, "Tacitus of the Novelette," as he has been termed for his powers of concise wit. This quality, allied to a certain sensitiveness to the gloomy and even the grewsome, makes him difficult of appreciation by the untrained student-mind. For opposite reasons *Aprilwetter* is meant only for the student that has passed the stage of humor exposition. *Die Prärie am Jacinto* has the advantage or disadvantage of placing its story on American soil; it is written with a journalistic lightness and "go" that should make it popular. A far different book is Mörike's *Mozart*, a semi-biographical study of the musician, containing so subtle an analysis of the musico-poetic temperament that, to put it hyperbolically, it is "meat for strong men."

Trees Gnawed by Beavers. Illustration from "How We Are Clothed." Copyright, 1905. The Macmillan Co.

The most encouraging sign of the raising of the standard is the nature of some of the new works. Leaving out of this consideration Goethe's famous pastoral, or Schiller's history, or the tales of Goethe and Zschokke, as so well known, we refer particularly to a politico-biographic work such as the life of Bismarck through his speeches and letters, arranged so as to give the scholar a coherent idea of his period and his work. Again, Helmholtz's scientific lectures, developing conceptions difficult in themselves, apart from the German. On a historical subject there is that most excellent work of Biedermann, creating for the student's knowledge of modern German life and ideas an eighteenth century background. Such subjects mark the advance in the conception of the potential capacities of the higher student. A most interesting drama by Ernst deals with the problem of true teaching and the true teacher, and is to be used only in the highest classes in college. A splendid edition of the prose original of *Alt Heidelberg*, called *Karl Heinrich*, is also of this class.

Of formal grammatical works there is to be noted the usual short-cut-to-idioms-through-conversation book, by Kuphal, a *German Drill Book* by Ball that is unnecessary in view of the more interesting grammars; a new German grammar for about the first year, by Kayser and Monteser, which makes a favorable impression through its careful arrange-

ment, choice of prose and poetic selections and its general tone of accuracy and intelligence. Favorable comment must also be given to Fossler's *Practical German Conversation*, for its remarkably wideawake method, the subjects for conversation being unusually real, the effect thoroughly natural, with a pleasing and witty personality running through it all.

Spanish and Italian

- Valera's El Comendador Mendoza*, by Rudolph Schwill. Breton's *Quién Es Ella?* by Samuel Garner. Calderón's *La Vida Es Sueño*, by W. W. Comfort. New York: The American Book Co. 70 cents each.
- Alarcón's Novelas Cortas Escogidas*, by Alfred Remy. Asensi's *Victoria*, by Edgar S. Ingraham. Boston: D. C. Heath & Co. 50 cents each.
- Valera's El Cautiro De Doña Mencía*. By R. Díez de la Cortina. New York: W. R. Jenkins. 35 cents.
- A *Brief Italian Grammar with Exercises*. By Hjalmar Edgren. New York: William R. Jenkins. \$1.50.

La Vida es Sueño, the most philosophical of Calderón's dramas, if not his masterpiece, has found an excellent editor in Prof. W. W. Comfort. Of course, this work can only be read with pleasure and utility by students who have already made considerable progress in Spanish. But for such students the notes and suggestions are all that is required for elucidating grammatical difficulties and occasional obscurities. Breton's *Quien es ella*, edited by Samuel Garner, is almost free from the puzzling idioms that render a good deal of Spanish literature so troublesome to the for-

eigner, and is, therefore, peculiarly suitable for class instruction. Still, it is not entirely free from them, and much of the space in the footnotes devoted to mythological and historical names likely to be known to the student might have been better employed in clearing up an occasional obscurity. The introduction gives a very full and clear account of the development of the Spanish drama, and, incidentally, of the literary career of the author. Altho Valera is sometimes so subtle and analytical that he becomes occasionally tiresome, he has no superior in the Spanish literature of the nineteenth century. *El Comendador Mendoza* exhibits his incisive satire, gay humor and gifts of observation at their highest. The notes and vocabulary of Professor Schwill give the student all the help needed for the comprehension of this delightful story. *El Cautior de Doña Mencía*, by the same author, has been edited by R. Diez de la Cortina. Alarcón is probably the best short story writer that Spain has produced, and the *Novelas cortas escogidas*, edited by Alfred Remy contain the cream of them. This edition has a very complete vocabulary, ample notes and a brief sketch of the author's life. Asensi's *Victoria y Otros Cuentos* are not noticeable for literary quality, but they offer easy and sufficiently interesting material for early reading, as they are written in a simple style and free from involved constructions. Professor Ingraham supplies useful notes and a full vocabulary.

A Brief Italian Grammar, with Exercises, by Hjalmar Edgren, presents a clear and concise outline of the essential features of the language. The exercises are sufficiently numerous to enable the student to assimilate the grammatical principles and to enter on a course of intelligent reading afterward.

Greek and Latin

- Livy*. Books 1, XXI, XXII. By Emory B. Lease. New York: University Publishing Co.
Xenophon's Anabasis. By Charles Forster Smith. New York: D. Appleton & Co. \$1.50.
Greek Prose Composition. By Edward H. Spleker. New York: The American Book Co. \$1.30.
Essentials of Latin. By Henry Carr Pearson. New York: The American Book Co. 90 cents.
A First Latin Writer. By Mather A. Abbott. New York: The American Book Co. 50 cents.
Latin Composition. By Benjamin L. D'Ooge. Boston: Ginn & Co. 50 cents.

Latin Exercise Books. By A. I. Doley. New York: University Publishing Co. I., II., III., IV.
Julius Caesar. Edited by William Hammond McDougal. New York: D. Appleton & Co. 35 cents.

Possibly the appearance of so many new editions of classical text-books may be explained by the continual advances made by the modern science of language and the necessity of presenting the most recent results of philological research at the earliest possible moment. At all events the present day student has the embarrassment of making his choice, for most of them exhibit accurate scholarship and have some special distinctive qualities of their own. So, while Professor Lease's *Livy* has an excellent introduction, in which the earlier historians are discussed and the author's syntax and style treated exhaustively, the feature that gives a distinctive flavor to this edition is the skill with which the student's attention is concentrated on those peculiarities of style that stamp on the prose of Livy its characteristic quality. In this way he is almost forced to appreciate in its entirety the manifold variety of the narrative. In editing the first four books of Xenophon's *Anabasis* Professor Forster Smith has had a wide field from which to choose a text. He has selected the Teubner text revised by Gemoll (1899), and the selection was judicious, altho he does not always accept Gemoll's emendations. The edition is in every way excellent, but the vocabulary is especially admirable. Those words which a good teacher would like to see fully treated are illustrated by copious references and a new light is thrown on the meaning of some terms which have been neglected by other editors of the *Anabasis*. For instance, the true distinction between *ιερα* and *σάγια* is expounded, and Professor Smith's protest against the common interpretation of *πύλην*, in a much discussed passage in the first book, would seem to be based on sound judgment. For those students who are familiar with the ordinary forms of Greek inflection the *Greek Prose Composition* by Dr. Spieker will be extremely valuable. The introductory notes are as philosophical as they are clear and practical. Take, for instance, the section which discusses the differences between Greek and English in the use of abstract

and concrete terms. A class that makes a conscientious study of the exercises following need not fear to tackle Demosthenes or even Plato. Pearson's *Essentials of Latin* is designed to prepare the way for reading Cæsar. The material for reading seems to be carefully graded and there is a constant comparison between Latin and English usage, so the book will no doubt attain its purpose. As an introduction to Latin composition Abbott's *First Latin Writer* will be found suitable for students who have completed their first year. The lesson vocabularies and examples appear to have been carefully selected, and the fundamental rules are set forth simply and concisely. D'Ooge's *Latin Composition* is for more advanced pupils. Part I is based on Cæsar, Part II and III on Cicero. They contain an orderly and systematic treatment of the principles of Latin syntax, and the whole book is excellent both in its general plan and in its details. Professor D'Ooge evidently regards Latin composition, not as an end in itself, but as the best means of acquiring Latin vocabulary and grammar. And certainly this is the modern point of view. The four Latin Exercise Books by A. L. Dotey are a rather novel feature in the Gildersleeve-Lodge Latin Series. They are based on the first four books of Cæsar's Commentaries and can be used with any edition. As a guide and help to the student in the preparation of his lessons we know of nothing that is at all so good, and they will aid an energetic and intelligent teacher immensely in securing definite recitations and systematic reviews. The "Suggestive Questions and Notes" at the top of each chapter, besides furnishing a vocabulary, enables the student to master the grammatical principles of the lesson.

History

- Medieval and Modern History.* By Philip Van Ness Myers. Boston: Ginn & Co. \$1.65.
The Ancient World. The Makers of Europe. By E. M. Wilmot-Buxton. New York: E. P. Dutton & Co. \$1.00 each.
Essentials in English History. By Albert Perry Walker. *Essentials in American History.* By Albert Bushnell Hart. New York: The American Book Co. \$1.50 each.
Readings in European History. Vol. 1. By James Harvey Robinson. Boston: Ginn & Co. \$1.50.
A School History of England. By Harmon B. Niver. New York: The American Book Co. 90 cents.

Moki Indian Girls of Arizona. From Dodge's *Advanced Geography*. Chicago: Rand, McNally & Co.

- Famous Men of Rome. Famous Men of Greece. Famous Men of the Middle Ages.* By John H. Haaren and A. B. Poland. New York: The University Publishing Co. 50 cents.
A History Syllabus for Secondary Schools. \$1.20
Outline of Medieval and Modern European History. Outline of English History. Outline of Ancient History. Outline of American History. By Herbert Darling Foster, et al. Boston: D. C. Heath & Co. 15 cents each.
Favorite Greek Myths. By Lillian Stoughton Hyde. Boston: D. C. Heath & Co. 50 cents.
A Source Book of Roman History. By Dana Carleton Munro. Boston: D. C. Heath & Co. \$1.00.
History of the United States. By William C. Doub. New York: The Macmillan Co. \$1.00.
History of the Pacific Northwest. By Joseph Schafer. New York: The Macmillan Co.
History and Government of the United States. By William Estabrook Chancellor. New York: The American Book Co. 30 cents.
Short Stories from American History. By Albert F. Blaisdell and Francis K. Ball. Boston: Ginn & Co. 40 cents.
Columbus and Magellan. By Thomas Bonaventure Lawler. Boston: Ginn & Co. 40 cents.
Abraham Lincoln. By James Baldwin. New York: The American Book Co. 60 cents.
Historical and Biographic Narratives. By Isabel R. Wallach. New York: The American Book Co. 35 cents.
Four American Indians. By Edson L. Whitney and Frances M. Perry. New York: The American Book Co. 50 cents.

In Myers's *Medieval and Modern History* we have a combination of thorough and methodical scholarship with vivid and picturesque narrative, qualities not often found in conjunction. The book has had a long popularity in the schools of the country, but this new edition has been thoroughly revised and brought up to date. A large amount of fresh material has been inserted and important recent events find a place in it. *The Ancient World*, by E. M. Wilmot-Buxton, gives a striking picture of the

mind, manners, customs, myths and legends of the different ancient nations and describes the influence exercised by these nations on one another. Hart's *Essentials in American History* and Walker's *Essentials in English History* are excellent historical expositions, logical and coherent in arrangement and clear in statement. These volumes cover a very wide range and have been written in the true spirit of independent research. Professor Robinson's *Readings in Euro-*

shed on it by the knowledge of the growth and civilization of other European countries. It should form an excellent supplement to Niver's *School History of England*, from which the student can gain an adequate and well proportioned conception of England's growth and of the present condition of the British Empire. *Famous Men of Greece*, *Famous Men of Rome* and *Famous Men of the Middle Ages*, three volumes by John H. Haaren and A. B. Poland, are based on

From Dopp's "The Place of Industries in Elementary Education." University of Chicago Press

pean History open a direct and convenient road to historical sources. He has performed a difficult piece of work skilfully and discriminatingly. Such a book is sure to render the reader's appreciation of the reality of historical persons and events keener than any second-hand record is able to do. In Wilmot-Buxton's *Makers of Europe* the outlines of the main features of Continental European history are presented concisely but interestingly. It is sufficiently thorough to show that English history assumes a new significance, indeed, can be intelligently studied only in the light

the idea that the study of Greek, Roman and modern European history in the form of biography, should precede the study of detailed American history. The biographies are pleasantly written, the illustrations are particularly excellent, and the books seem altogether adapted to the purpose intended. *Outlines of Ancient History*, *Medieval and Modern European History*, *American History* and *English History* are reprints from the *History Syllabus for Secondary Schools*, prepared by a special committee of the New England History Teachers' Association. They furnish complete

topical epitomes and supply references to the best historical works treating of different periods as a basis for study. These little books ought to stimulate investigation, as they enable students to appropriate the best to be found in a great variety of authorities. The *History Syllabus* from which they are taken cannot, however, be dispensed with by the progressive educator, for, besides the surveys of the four fields of history to be studied, it contains exhaustive general and special introductions, teeming with practical suggestions of the very greatest value as to the methods, aims and objects of historical teaching. *Favorite Greek Myths*, by L. S. Hyde, is written in a simple and picturesque style. It has a number of very attractive illustrations. The task of selecting material for *A Source Book of Roman History*, limited to some two hundred and fifty pages, cannot have been easy. But from such a wealth of sources Professor Munro seems to have made as satisfactory a choice as could have been expected in the circumstances. In Mace's *School History of the United States* important and typical events are made to stand out in vivid relief, and the human and dramatic feelings of the pupil are stimulated and held by the fullness and force of the descriptions. It is in every respect an admirable elementary text-book. *A History of the United States*, by William C. Doub, treats the subject of civics with great thoroughness and shows its intimate connection with history. The plan is well adapted to give the student some conception of the real nature of government and his relation to it. In fact, in the hands of a well-equipped educator this volume will render a separate study of civics unnecessary. The impressive story of civilization building in *The Pacific Northwest* is told by Prof. Joseph Schafer with all the vividness and force which the interesting, instructive and often heroic incidents he has to deal with demand. He shows a fine grasp of the relative importance of events and has succeeded in proving that northwestern history has a remarkable and unsuspected unity. The early period of its development is treated with great fullness and in style that fascinates the reader. *History and Government of the*

United States, by W. E. Chancellor, is intended for students in the evening schools. It is packed full of just the information needed by such pupils, especially by our foreign-born future citizens. *Short Stories from American History*, by Albert F. Blaisdell and F. C. Ball, presents the picturesque life of our forefathers in the form of personal incidents and anecdotes. They are vivid narratives of dramatic events, and their human interest will appeal to the young reader. As a supplementary reading book, *Stories from American History*, by E. H. L. Turpin, will be found valuable for elementary classes. *Four American Indians*, by E. L. Whitney and F. M. Perry, emphasizes the picturesque aspects of the careers of the most notable Indians in our history. It is a sympathetic and vigorous narrative. *The Story of Columbus and Magellan*, a small volume by T. B. Lawlor, in which some of the stirring events connected with the two greatest deeds in the history of geography are successfully depicted. While the *Abraham Lincoln* of G. Baldwin does not throw any new light on the career of the martyr President, it describes well known events pleasantly and impressively. The causes and motives that produced the Civil War are unfolded concisely and lucidly, and the book is entirely free from political bias or sectional prejudice.

Civics

- School Civics*. By Frank David Boynton. New York: Ginn & Co. \$1.00.
Government and the Citizen. By Roscoe Lewis Ashley. New York: The Macmillan Co. 70 cents.
The Government of Ohio. By Wilbur H. Siebert. New York: The Macmillan Co. 75 cents.

The two books of high school grade on civil government in the United States are very similar in character and scope, and the choice between them must be left to the individual teacher. *School Civics* gives more attention to the origin and theory of government and the growth of political institutions, and *Government and the Citizen* is strongest on details of local administration. Both authors have the courage to present current political issues, giving briefly but fairly the arguments on both sides.

Geography and Industries

- The Place of Industries in Elementary Education.* By Katharine Elizabeth Dopp. Chicago: The University of Chicago Press. \$1.00.
- How We are Clothed.* A Geographical Reader. By James Franklin Chamberlain. New York: The Macmillan Co. 40 cents.
- Excursions and Lessons in Home Geography.* By Charles A. McMurry. New York: The Macmillan Co.
- The Western States.* A Geographical Reader. By Harold Wellman Fairbanks. Boston: D. C. Heath & Co.
- First Principles of Agriculture.* By E. S. Goff and D. D. Mayne. New York: American Book Co. 60 cents.
- Elementary Geography.* 75 cents; *Advanced Geography.* \$1.20. By Richard Elwood Dodge. Chicago: Rand, McNally & Co.
- Geography of New York.* By F. R. Smith and A. C. Perry. New York: American Book Co.
- Students' Laboratory Manual of Physical Geography.* By Albert Perry Brigham. New York: D. Appleton & Co. 60 cents.

There is nothing in which it is easier to arouse the curiosity of children than in how things are made, especially in processes which they can imitate in a primitive way. And the satisfaction of this curiosity is of the highest educational value, for when properly directed it serves as "open sesame" to geography, history and sociology. It is a necessary correlative of nature study and more useful in providing hooks of attachment for the unconscious accumulation of facts throughout life. The theory of the study and its practical methods as developed under Professor Dewey in the University of Chicago are given in Miss Dopp's book on *Industries in Elementary Education*. The effect of the movement for the recognition of the educational value of industries is shown in all the books before us. In *How We*

Are Clothed will be found simple and suggestive talks on the products of the cotton field and sheep ranch. Dr. McMurry gives us outlines of neighborhood excursions to factories, farms and Governmental buildings in New York, Chicago, Denver, Florida, California and many other localities, from which the true teacher can find how to utilize the resources of his own vicinity. Western teachers have hard work finding material for interesting their pupils in local history and geology; so they will welcome Fairbanks's *Geographical Reader of the Western United States*, altho it does not possess any literary attractiveness. *First Principles of Agriculture* is an admirable elementary text-book, comprehensive, simple, practical and teachable. The special excellence of Dodge's *Geographies* lies in their clear maps and numerous pictures, which differ from those ordinarily found in text-books in being fresh and really illustrative. Where time will not allow its use by students, Brigham's *Laboratory Manual* should be at least in the desk of every teacher of physical geography for the many admirable exercises it gives on the interpretation of the U. S. Geological Survey Maps and meteorological charts.

Mathematics

- Special Method in Arithmetic.* By Charles A. McMurry, Ph.D. New York: The Macmillan Co. 70 cents.

The Cecropia Moth (Male). From Dickerson's "Moths and Butterflies." Boston: Glinn & Co.

Arithmetic, Books 1, 2 and 3. By J. W. A. Young, Ph.D., and Lambert L. Jackson, A.M. New York: D. Appleton & Co. 35 cents.

Arithmetic for Evening Schools. By William E. Chancellor. New York: The American Book Co. 30 cents.

Elementary Algebra. By Arthur Schultze, Ph.D. New York: The Macmillan Co. \$1.10.

A First Book of Algebra. By John W. Hopkins and P. H. Underwood. New York: The Macmillan Co. 50 cents.

Grammar School Algebra. By A. W. Potter. New York: The American Book Co. 50 cents.

Exercises in Algebra. By Edward R. Robbins and Frederick H. Somerville. New York: The American Book Co. 50 cents.

Examples in Algebra. By Charles M. Clay. New York: The Macmillan Co. 90 cents.

Plane and Spherical Trigonometry. By P. A. Lambert and H. A. Foering. New York: The Macmillan Co. \$1.50.

Analytical Geometry. By Albert L. Candy, Ph.D. Boston: D. C. Heath & Co. \$1.50.

Of this list the first named is most noteworthy. It is an effort to promote condensation and to make effectual excision. The purposes are clearly and convincingly stated. The essentials are properly chosen. It is a wise attempt to avoid the "little knowledge" of many things—superficial and often useless, which many old-time text-books fostered. The texts of Professors Young and Jackson have some admirable features. The theory of recurrence of topics, making each discussion a "little more so," is used throughout. It has strong advocates; it does not seem wise to very many experienced and most successful teachers. There are arguments for placing decimals prior to general fractions, but it does not appear logical. There is effort here and there to tuck in odds and ends of information. There are also cases where elaborate explanation of simple things may lead to confusion rather than clearness. Superintendent Chancellor's book for evening schools has a definite purpose; meets a present demand and does it well. Evening schools, answering peculiar needs, may well be freed from all dead weight.

Dr. Schultze's *Elementary Algebra* is a modest and most admirable text. There seems no confusion. The sequences throughout are perfect. The restraint of the book is especially worthy of praise. There are so many texts wherein the author seems to cry "Behold! there is a lovely Joss just a bit one side; let us go burn a prayer paper there!" And they go. Dr. Schultze does none of that. It is fully adequate as a preparation for college work in algebra.

The First Book in Algebra lacks the basic elements of a first book. The impression is as if one were sharpening a leadpencil with a table knife. The paragraph on the two roots of a quadratic (page 215) seems characteristic. The putting in on occasion of little nubbins of higher nomenclature does not help matters for beginners.

If there must be a *Grammar School Algebra* perhaps Professor Potter's little books meets the need. However, when a pupil is ready for algebra why not treat him as ready for algebra? The difficulty in passing from arithmetic to algebra lies in the grasp of the symbols and their full meaning. There need be no revival in algebra of the "series" of "more so's," which rioted years ago in other school subjects. The two books containing algebraic exercises and examples are both admirable and will be of great service to good teachers. Class exercises in algebra should rarely be those of the text studied. What the time limits of most teachers will not allow these books, with the aid of a few hundred blank cards, will make easy.

Why Professors Lambert and Foering should open their text-book by an absolutely useless definition which traverses its own terms and has no apparent pertinence thereafter seems a conundrum. Throughout the text awkward methods seem to be used. The opening of the *Spherical Trigonometry* is especially confused.

Professor Candy's text is excellent for those of positive mathematical tastes and tendencies. Its discussions are clear, but the generalization presupposes more mathematical skill than most college sophomores have.

Chemistry and Physics

Outlines of Inorganic Chemistry. By Frank Austin Gooch and Claude Frederic Walker. New York: The Macmillan Co. \$1.75.

The School Chemistry. By Elroy M. Avery. New York: The American Book Co. \$1.20.

College Laboratory Manual of Physics. By E. H. Hall. New York: Henry Holt & Co. 80 cents.

The First Book in Physics. By J. A. Culler. Philadelphia: J. B. Lippincott Co.

That chemistry is in a transition stage from a descriptive science, like botany, to a logical and mathematical science like physics is clearly shown by Professor Gooch's *Inorganic Chemistry*. In this

he has developed the general laws and theories of chemistry systematically in Part I, and relegated almost all descriptions of the elements and compounds to Part II, which, rather inconveniently for the user, is paged separately. This plan has some advantages, but many teachers will find it awkward, even for college students who have already been over the ground in an elementary way. In the descriptive portion the theoretical conceptions are rarely referred to, even where they are urgently needed to interpret the phenomena discussed. Therefore unless stimulated by vigorous quizzing the average student will fail to apply in Part II what he learned in Part I, and will simply stow away in the water-tight compartments of his brain two more distinct sciences. But, dropping this debatable question of arrangement, this book is a thorough, competent and comprehensive work of over 700 pages.

Many high school teachers clung to Avery's *Chemistry* long after it got out of date, simply because it was so easy to teach. Its popularity was due chiefly to its convenient typographical arrangement, its practical directions for experiments and its excellent questions and problems. We are very much disappointed that the new edition is not thoroughly rewritten so as to give it the same standing among modern text-books that it had ten years ago. The tacking on of paragraphs about radium and argon is not enough to keep pace with the revolution which the new theories and conceptions have made in the elementary teaching of chemistry.

Hall's *College Manual of Physics* contains the exercises used in the Harvard course of one year, including such as taking indicator diagrams from a steam engine, determining the efficiency of a dynamo, the thermal conductivity of iron and the like. Culler's *First Book* is at the other end of the educational ladder. It gives very plainly worded definitions and explanations, accompanied by practical questions and simple experiments, all within the capacity of grammar grade students. But none of it is "play-science;" it is genuine, practical and correct knowledge, so far as it goes, and

such as will not have to be unlearned later in order to learn more.

Botany

- Elements of Botany.* By J. Y. Bergen. Boston: Ginn & Co. \$1.10.
Experiments with Plants. By W. J. V. Osterhout. New York: The Macmillan Co. \$1.25.
Plant Morphology. By O. W. Caldwell. New York: Holt & Co. \$1.00.
College Botany. By G. F. Atkinson. New York: Holt & Co. \$2.00.
Our Native Orchids. By William Hamilton Gibson and Helena L. Jelliffe. New York: Doubleday, Page & Co. \$1.35.

There has been no more successful text-book and laboratory guide in elementary botany than that by Bergen, and teachers will welcome the revision of the book first published nearly ten years ago. In its new form the *Elements* is unsurpassed as a book for a half-year course in high school. "The Foundations of Botany," by the same author, appears to be better adapted to a longer course, for example, the common five hours per week for one school year.

Osterhout's *Experiments with Plants* is a guide to simple studies by which familiar plants may be made to answer the numerous interesting questions concerning plant life. There are directions for many simple experiments concerning germination, the work of the various plant organs, and the influence of surroundings. In addition there are chapters dealing with plants which cause decay and disease, and the making of new kinds of plants. The book on the whole will be most valuable for teachers of botany in high schools; but many of the simplest experiments will fit in well with nature study for the elementary schools, especially so when these studies have an agricultural trend.

Caldwell's *Plant Morphology* is a new book on the plan of the well-known "Handbook of Plant Dissection," by Arthur, Barnes and Coulter, published nearly twenty years ago. It is an excellent guide for study of plant structures in a college course. Atkinson's *College Botany* is an enlargement of his well-known "Elementary Botany." The book deals with the physiology, structure, life history, relations to environment and principles of classification of plants. It is certainly an excellent text-book for a general introductory course in college.

Our Native Orchids is a guide to the identification of about sixty native orchids. It is based upon the unfinished notes and drawings by the late William Hamilton⁴ Gibson. The keys, descriptions, illustrations and notes will make the volume very useful to amateur botanists interested in this remarkable group of plants.

Physiology and Hygiene

- The Hygiene of the Schoolroom.* By William F. Barry. New York: Silver, Burdett & Co. \$1.50.
- Physiology and Hygiene.* By H. W. Conn. New York: Silver, Burdett & Co.
- How to Keep Well.* By Albert F. Blaisdell. Boston: Ginn & Co. 45 cents.
- Hygienic Physiology.* By Walter Moore Coleman. New York: The Macmillan Co. 50 cents.
- A Health Primer.* By Walter Moore Coleman. New York: The Macmillan Co. 35 cents.
- The Physical Culture Life.* By H. Irving Hancock. New York: G. P. Putnam's Sons. \$1.25.
- Physiology and Hygiene for Children.* By Robert and Andrew Eadie. New York: The University Publishing Co. 45 cents.
- Lippincott's Physiology.* First, Second and Third Books. By J. A. Culler. Philadelphia: J. B. Lippincott Company. 30, 50 and 80 cents.

The eight new text-books of elementary physiology listed above are all on the general plans of over one hundred similar books for public schools now offered by American publishers. They represent not special advances in the teaching of the subject, but rather the ways and words which other teachers use in presenting the simplest facts in the elementary study of the human body. Only in matters of quite insignificant detail is it possible to decide between dozens of physiology text-books now in the market, and space here will not allow for pointing out the relatively unimportant differences in details in these books, which have no decidedly new characteristics. Barry's *Hygiene of the Schoolroom* is a practical work for teachers and school officials, aiming to give the essential knowledge of the means of conserving the health of pupils in schools. The *Physical Culture Life* is an interesting and useful treatise which explains the established and essential facts of physical culture. It is a very simple and yet satisfactory exposition of the facts which every liberally educated man and woman should know.

Nature Study

- Nature Study.* By Frank Overton and Mary W. Hill. New York: The American Book Co. 40 cents.
- Nature Study with Common Things.* By H. M. Carter. New York: The American Book Co. 60 cents.
- Special Method in Elementary Science.* By Charles A. McMurry. New York: The Macmillan Co. 75 cents.
- Nature Study Lessons.* By Lida B. McMurry. New York: The Macmillan Co. 60 cents.
- Nature Teaching.* By Francis Watts and William Freeman. New York: E. P. Dutton & Co. \$1.00.
- How Nature Study Should be Taught.* By C. F. Bigelow. New York: Hinds, Noble & Eldridge. \$1.00.
- The Outlook to Nature.* By L. H. Bailey. New York: The Macmillan Co. \$1.25.
- Moths and Butterflies.* By Mary C. Dickerson. Boston: Ginn & Co. \$1.25.

In the *Outlook to Nature* Professor Bailey returns to the field which his pen has so often touched and he again urges the importance of contact with nature, a sympathetic attitude toward which "means greater efficiency, hopefulness and repose." "Men keep young by knowing nature. They also should keep true." This is the central thought of the first chapter, "The Commonplace," and indeed it is the basis of the entire book. The second chapter, "Country and City," contrasts life, simple and complex, and takes a most optimistic outlook upon country life. "We need the kind of nativeness and essentialness that develops in the country. . . . We all perceive a growing tendency countryward, coming in response to a universal soul hunger that the strenuous and complex life does not satisfy." In the third chapter, "School of the Future," the author stands for the educational merit of human affairs and industries and especially the study of nature. The school of the future will give an intimate and vital touch with these essentials. Finally, it is but natural that the author should conclude with a touch upon the theory of evolution, that greatest of scientific generalizations which has so profoundly modified our attitude toward nature. And here, face to face with the problems of science, philosophy and theology, the author's optimistic outlook to nature leads him, while ready to believe

"that the visible universe has taken its present form as the result of physical forces of which, in their lesser expressions, we have common knowledge," while accepting even this extreme of evolution theories the author's outlook leads him to feel that "we are coming to

a religion of joy and activity, full of high spirituality, of great trust in nature, of hope in man and of direct dependence on the Almighty."

To such heights of optimism does the author's outlook to nature lead him, and with him his reader, who can scarcely fail to catch much of the spirit of hopefulness and repose which everywhere stands prominent in this master-stroke by an already acknowledged leader in our progress natureward.

Overton and Hill's *Nature Study* is intended to furnish a year's work for pupils from eight to eleven years of age. It consists of thirty-three lesson plans on very common objects, and even a teacher with no training in nature study ought to give a very interesting course of nature lessons with the guidance of this book. The book is no better than several similar books, but the materials selected may be more available for certain schools. Carter's *Nature Study with Common Things* is a practical guide for seventeen lessons with common fruits and vegetables, such as are readily obtainable in the markets. It aims to give training in accurate observing. The lessons are one hour each, exclusive of drawings and writings which are suggested. The book is a very practical guide for teachers who need very definite directions for their nature study lessons. McMurry's *Elementary Science* is a revision of the author's earlier book of the same title, and there are added outlines for the last four grades of the elementary school. A large part of the book deals with the principles of nature study—the title of the book should have been "Nature Study," instead of the loose use of "Elementary Science," and there is an outline for a course extending throughout the eight years of the elementary school. The average teacher with little special training may get help from the outlines and lesson-plans, but the discussion of principles will make the book most valuable to those who are interested in the bearings of nature study on general education. McMurry's *Nature Study Lessons* is a fuller working out of the outlines for primary grades given in the book mentioned above. Nineteen lessons on common animals in which young children are interested and ten on plants are given in full for the

teacher who must have such help, and even those with original ideas for nature lessons will probably get useful suggestions from these plans. Watts and Freeman's *Nature Teaching*, originally written for use in the West Indies, is a study of plants from the standpoint of agriculture. It has many good suggestions for teachers of the agricultural phase of nature study.

How Nature Study Should be Taught is a series of interesting talks to teachers, urging a more general and sympathetic teaching concerning nature. The book is interesting, suggestive and stimulating to a more direct touch with out-of-door life in our attempts to teach nature from the standpoint of the child.

Dickerson's *Moths and Butterflies* is an untechnical natural history of the common forms of these insects. It will identify by means of its photographs from life forty common species, in larval, pupal or adult stages, and gives a large amount of interesting information concerning the life-histories and relations of the insects' surroundings. It will be found a very useful book for the nature study library in schools and for private ownership by pupils of the upper grammar and high school grades.

Books for Teachers

- A History of Education in the United States.* By Edwin Grant Dexter. New York: The Macmillan Co. \$2.00.
- A History of Columbia University, 1754-1904.* New York: The Macmillan Co. \$2.50.
- The New York Public School.* By A. Emerson Palmer. New York: The Macmillan Co. \$1.00.
- Our Schools: Their Administration and Supervision.* By W. E. Chancellor. Boston: D. C. Heath & Co.
- Economy in Education: A Practical Discussion of Present-Day Problems of Educational Administration.* By R. N. Roark. New York: American Book Co.
- Notes on German Schools.* By William H. Winch. New York: Longmans, Green & Co.
- The Trend in Higher Education.* By William R. Harper. Chicago: University of Chicago Press.
- The Classics and Modern Training.* By Sidney G. Ashmore. New York: G. P. Putnam's Sons.
- The Educative Process.* By William Chandler Bagley. New York: The Macmillan Co. \$1.25.
- How to Tell Stories to Children.* By Sara Cone Bryant. Boston: Houghton, Mifflin & Co. \$1.00.

Teachers are so fond of giving advice that, not content with giving it all day to their pupils, they devote much of their spare time to giving it to each other in teachers' meetings, institutes and books. The large amount of attention given to

the elucidation of theories and the discussion of methods is, however, not so superfluous as it may appear, for there are more amateurs in the teaching profession than in any other. We have reviewed during the year a large number of books on educational history, theory and practice, but in addition to these we must call the attention of teachers and directors of teaching to a few more of the important publications of the year.

There are, first, a group of books on the history of education, prominent among which is Professor Dexter's *History of Education in the United States*, a work of truly encyclopedic comprehensiveness, but nevertheless readable. Of especial value are the extensive bibliographies in each chapter by which one can follow any subject in which he is interested, such as summer schools, the elective system, Indian education or correspondence teaching. It is the best single volume reference book on the subject for a school library. The one hundred and fiftieth anniversary of the founding of Columbia University gives occasion for a history of the university by the heads of its various departments, and the centennial of the establishment of the New York public schools brings out a history of free education in the city of New York by the Secretary of the Board of Education. A revised edition of Painter's *History of Education* is published in the International Educational Series.

A great deal of valuable information and useful advice to school superintendents is given in Chancellor's *Our Schools*. He tells all the secrets of how to get the office, how to manage the school board and the teachers, and how to keep on the best possible terms with the public and the newspapers. It is a book of high ideals and much common sense. Professor Roark's book on the same subject is of less interest and value. Since *German Schools* from the kinder-

garten to the gymnasium are always held up to us as models, it is well to know what they really are as seen by a competent English observer.

President Harper considers that the *Trend in Higher Education* is toward a greater democracy, and argues that education is continuously becoming more general, more thorough and more systematic. Among the other subjects discussed with his customary clearness and force in this volume of essays and addresses are "The Business Side of a University," "Theological Education" and "The Situation of the Small College." Professor Ashmore's plea for the classics in modern training is well considered and presented, but, naturally, does not contribute anything very novel to the discussion.

One of the most important books of the year on the psychology of education, ranking perhaps next to President G. Stanley Hall's great work on "Adolescence," is Bagley's *Educative Process*. It is a thorough and logical presentation of educational theory, based upon the best modern psychology and abundantly illustrated by examples of right and wrong methods in teaching. Professor Bagley adopts the Hebartian idea that the true aim of education is morality, the meaning of which he develops as "social efficiency." He defines education "as the process by means of which the individual acquires experiences that will function in rendering more efficient his future action." And he does not forget his definition, as many authors do, but consistently applies it throughout. It is to be hoped that this work will replace the trashy "teachers' psychologies" sometimes found in normal schools.

Story tellers are doubtless born, not made, but even one who is born with the proper capability will find many suggestions as to selection and adaptation and some good examples in *How to Tell Stories to Children*.

The Russian and Japanese Peace Envoys

BARON JUTARO KOMURA

Both the Japanese Peace Commissioners are men of humble birth, who have risen from the ranks by their own ability. Baron Jutaro Komura has been for three years the Japanese Minister of Foreign Affairs, and has, therefore, had charge of the difficult diplomatic negotiations with Russia and other nations preceding and during the war. No other Japanese is so thoroughly acquainted with the issues involved, or with the character of his opponents. He was born in the Province of Hiuga, in the south of Japan, as far as possible from the birthplace of Mr. Takahira. He came to the United States at the time of our first World's Fair, the Centennial, and entered Harvard, from which he was the first Japanese to take a degree. He was the predecessor of Mr. Takahira as Minister at Washington, and also served as the representative of Japan at St. Petersburg. At the time of the Boxer Rebellion of 1900 he was Minister to China, and it is probably due largely to his skilful management of affairs that Japan came out of this difficult crisis with increased prestige in the eyes of the world. The war which at that time threatened to break out between Russia and Japan over the occupation of Manchuria was staved off four years. The Japanese troops which had landed in Korea were withdrawn, and Japan improved the respite by preparing actively for the inevitable conflict. In September, 1901, Komura was made Foreign Minister, and in February, 1902, was given the rank of Baron. In person he is slight and short, even for a Japanese, reserved in speech and a deep thinker.

KOGORO TAKAHIRA

The Japanese Minister at Washington, Mr. Takahira, is, like his colleague, Baron Komura, one of the products of the New Japan; both were educated at the Imperial University of Tokyo and trained for their work by long and varied experience in the field of diplomacy. He was born in the Province of Iwate, Northern Japan, in 1834, and at the age of twenty-two entered the Foreign Office as student *attaché*. Three years later he was appointed *attaché* to the Japanese Legation at Washington, and in 1881 became secretary of the legation and then *chargé d'affaires*. He was then called home and given three years' work in the Foreign Office at Tokyo. Next he was sent to Korea as *chargé d'affaires*, and afterward made Consul-General at Shanghai. In 1892 he was Consul-General in New York. Then he was given European experience by serving successively as Minister to Holland and Denmark 1893-1894, to Italy 1894-1895 and to Austria and Switzerland 1896-1899. Then after a year in the home office he was sent as Envoy Extraordinary and Minister Plenipotentiary to the United States. If he is successful in the present treaty negotiations it is expected that he will be rewarded by becoming Ambassador to the United States, the first of Japan's foreign representatives to be raised to that rank. He speaks English and French fluently, and is a thorough student of the classical Chinese literature and philosophy.

BARON ROMAN ROMANOVICH ROSEN

Neither of the Russian representatives in the Peace Conference can be regarded as a true Slav, for one of them is of Dutch descent and the other Swedish. In 1617, when Gustavus Adolphus crossed Lithuania and threatened Moscow, the ancestors of Baron Rosen went with him and decided to settle there rather than return to their native land. From this family have sprung many men who have left their mark in Russian history and literature. Baron Rosen first showed his diplomatic ability in Japan as an *attaché* of the Russian legation under De Struve. Instead of keeping himself aloof from the people among whom he was placed he learned to speak the language and made himself very popular with the Japanese, and even with their wives. It was soon after the inauguration of the Era of Enlightenment and the Japanese were eager to acquire all kinds of information as to foreign life and customs. The social gifts of the young *attaché* which had got him into trouble as an officer of the Imperial Guards in St. Petersburg were here of service, and are rumored to have helped along the bargain, very disadvantageous to Japan, of trading off Sakhalin for some worthless Kuriee Islands. But, however that may be, nothing he has done has injured his popularity in Japan or impaired the confidence which the Japanese have in him. On his departure from Tokyo four days after the outbreak of the war, after a long period of fencing for position with Baron Komura, he was the recipient of high honors from the Japanese. In 1886-1894 he was Consul-General in New York and *chargé d'affaires* at Washington in the Cleveland Administration. He has recently been appointed Russian Ambassador to this country as successor to Count Cassini.

COUNT SERGIUS WITTE

Unlike his colleague, Sergius Witte had no advantages of family, wealth or influence to start him on the ladder by which he was to climb to the highest position attainable by a subject of the Czar. He was born in Tiflis, Transcaucasia, in 1849, and was educated at Odessa, where he showed especial ability in mathematics and physics. He entered Government service as a railway clerk, and first attracted attention at the age of twenty-seven by his efficiency in bringing order out of confusion in the transportation of troops and supplies to the front in the Russo-Turkish War. For this prompt and competent assumption of responsibility he was placed in charge of the Russian Southwestern Railway and soon afterward called to St. Petersburg, where he was made Minister of Commerce and later Minister of Finance. He reformed the finances, placed the country on a gold basis, restored its credit and accumulated a large gold reserve. He brought almost all the railroads of Russia under State management, and constructed the longest railroad in the world, the Trans-Siberian, which connects St. Petersburg with Vladivostok. He made liquor selling a Government monopoly throughout the Empire, thus securing a large revenue and promoting temperance. The industrial development of Russia is largely due to his encouragement of manufactures. If the Government had listened to his warnings from St. Petersburg and Baron Rosen's from Tokyo this war would never have occurred. He recommended the evacuation of Manchuria and an alliance with Japan. But the influence of the Grand Dukes was too strong for him in this matter, and he was shelved by promotion to the position of Imperial Chancellor, to be called now to the help of Russia when the evils he prophesied have come upon her.

Education in the South and the Aristocracy

[In view of the meetings and conferences of the various bodies interested in education in the South held recently the following article is most timely. As the writer is connected with one of the leading Southern educational institutions, and does not wish to lose her position, she naturally does not feel obliged to sign her name.—EDITOR.]

IN connection with the preparations for its meeting during the last week of 1904 the Southern Educational Association took occasion to explain its existence through the publication of an announcement disclaiming any unwillingness to co-operate with the National Association, but calling attention to certain peculiar problems presented to educators of the South which were justly felt to demand separate consideration by those best acquainted with them.

Of these problems the negro, the "poor white" and the insufficiency of the school fund are the ones which naturally most attract the attention of the citizen in general, and they deserve no doubt the large amount of consideration which they are receiving. The Southern teacher, however, especially in academic and collegiate grades, recognizes other features which are also "peculiar," and he finds that he may be engaged in the elevation neither of negro nor mill-hand, and yet have a sufficient number of "problems" on hand to keep him busy and sore perplexed. A few of the South's educators have rather recently called attention to some of these less conspicuous but still serious obstacles to the attainment of the best results from the school work there, and none, perhaps, has touched upon more important truths than Prof. Edward Mims last year in a portion of his discussion of the literary South, and Professor Sledd in an article published in THE INDEPENDENT more than three years ago.

When the latter said: "On the threshold of every educational reform in the South the mover of new things is met by a *defective public sentiment*, supported on either hand by ignorance and indifference," and maintained that this was not a new condition, but a survival and natu-

ral consequence of the much lauded antebellum life, he seemed to have reached the very heart of the Southern educational trouble. I have always felt, however, that, while there is no question as to the gravity of the situation so far as the "poor white" is concerned, he failed to attribute a sufficient share of responsibility to the class to which it primarily belongs—the upper class.

The contribution of this portion of Southern society to the educational difficulty is twofold. The contempt for the lower white element, in a different form perhaps from that of the earlier days, still exists, and acts still as a barrier to any ambition which that class might have to rise. The aristocratic Southerner may have tasted dire poverty and the drudgery of daily toil, but he never forgets the difference between himself and the man who was *born* to that sort of life. Class prejudice, with its old-time ideas concerning manual labor and wage-earning, is so strong that the Southerner possessed of ancestry can hardly conceive the desirability of an educated laboring class. While he has not the definite antagonism to this which he frequently shows toward the education of the negro, while he is zealous enough in the matter of charitable aid and mission Sunday schools, he is too conscious of the great gulf fixed socially between the "common" people and himself seriously to entertain the idea of bridging it. In short, he wants his poor white brother to go to heaven, nor does he wish his departure for a future world to be unduly accelerated by a lack of the necessities of life in this, because the average Southerner is both religious and kind-hearted, but the idea of making the "poor white" a factor in the betterment of this present world has not yet strongly appealed to him.

But a more exasperating characteristic, and one which I think the worker on

educational lines comes to feel even more profoundly, is not the Southern gentleman's indifference to the education of his social inferiors, but his false ideal of the education which he wishes for himself and his.

Education for the show that can be made with it—that is in brief the Southern conception of it. Not for the discipline given by earnest and systematic intellectual labor, not for the pleasure which the acquisition of fresh knowledge brings, not for the increase of power to think logically and live consistently; but something that will make people point you out as the possessor of a degree, or as the president of a club, or as "one of the prominent literary figures of the South." In such things as these the Southerner sees the reward that makes going to college worth while. Should these distinctions fail to fall to your lot it were better to have gone into cotton or society. The false quality in the educational ideal shows itself in two ways, which are, however, intimately related: a preference for cheap and showy courses of study and a tendency extravagantly to overestimate what is in reality very ordinary scholarship and thus, from ignorance of the time and labor which any approach to great learning involves, to insist upon imagining the ordinary college graduate endowed with intellectual attainments which would befit a lifetime spent in purely studious pursuits, and—what is highly embarrassing to the aforesaid graduate—of being disappointed if he fails to know *everything*.

While much might be offered by way of example and comment in regard to the first named obstacle to good work in Southern schools, and tho I have put it first, I am increasingly of the opinion that the second, after all, is the fundamental difficulty, and yet I believe that it has not been especially recognized as a factor in Southern educational sentiment. If not fundamental, at least it is often interesting, not to say amusing. The following example may serve as an illustration of it: I have an acquaintance, a woman of intelligence and of more substantial education than most middle-aged Southern women (I use the term "middle-aged" advisedly), who, when I first knew her, struck me as having had

the most extraordinarily gifted circle of friends that it ever fell to the lot of one human being to possess. Those who had not died had removed to other places, but they one and all were described as being so pre-eminently skilled in music, literature, languages, etc., that I was overwhelmed at the thought of the contrast which she must find between those earlier friends and my insignificant self—until I began to hear her talk about *me*. At first I felt some natural gratification at discovering myself to be a person of so much greater attainment than I had ever dreamed, but in time I began to be oppressed by the difficulty of living up to the reputation for erudition which she was giving me. One day, after having enumerated in my presence my various scholastic accomplishments, she turned to me and added:

"And you've mastered Greek, too, haven't you?" *Mastered* Greek! I do not profess to have "mastered" the study which has been my favorite since childhood, and it is not Greek. No doubt her use of that particular word was partly due to a constitutional tendency to express herself in superlatives, but the point of the matter lies in the fact that it is quite impossible to make her and many other equally clever Southern women—and men as well—realize two things, that even to have studied a subject thoroughly in college does not mean that you have exhausted all its possibilities of acquirement and research, and that to have studied Greek at all does not of necessity imply astonishing mental endowment.

If such incidents were only amusing, or matters of temporary embarrassment to the person who is conscious of not knowing as much as he is supposed to, they would certainly hardly deserve to be dignified by recital as examples of Southern characteristics; but they seem to me to typify that habit essentially Southern—exaggeration. The universal tendency to make Southern skies bluer, Southern flowers sweeter, Southern men more chivalrous and Southern maids fairer than all others may have produced some very pretty effects in fiction, but the same tendency displaying itself in education does not bring about desirable results; for people who habitually create an un-

real world about themselves, who term "picturesque" in the Gulf States what they would call "ugly" along the Missouri, are not likely to see things educational in their true proportions, and are ready both to admire and condemn without any true standard for judgment in either case, the practical result of which is that Southerners generally have even more vague ideas than the rest of the American people as to what makes a teacher capable of teaching their children and as to what things it is best that their children should be taught.

Again, Southern parents seem to attach far greater importance to the manners than to the minds of their offspring. I am not without a certain admiration for good manners myself, but I cannot sympathize with the disposition to meet, not alone with suspicion, but with the most violent criticism, the plan of treating young people as responsible beings who do not need to be everlastingly watched. Southern taste still inclines to an educational system which sends pupils out to exercise in squads, with two teachers on guard, and supervises their private correspondence; and there is grave fear that something immoral may emanate from the "new education."

In the early years of a now successful art school a lady visitor, who was being, at her own request, shown through its rooms, finally burst into tears and confessed that it was worse even than she had feared. Her daughter, recently admitted as a student, had told her that she was learning to draw from plaster casts of the nude, but she had refused to believe it till she beheld with her own eyes.

This, of course, was some years ago, and an extreme case. It is true, too, that this prejudice exists pre-eminently in the case of girls, but it is none the less an important feature for that reason; whether it be that such an excess of prudery expended upon the protection of girlish innocence leaves none for the boys, or because of some subtle psychological law of balance, the forcing of an artificial modesty in one sex means corresponding deterioration of it in the other.

Of all American mothers the Southern one can assure you with the most fervor that "much as she wishes an education

for her daughter, she values her health far more," and with a view to its conservation, by the advice of the family physician, she withdraws her from school and sends out cards for her *début* into society. And while fathers and mothers of means send their sons to European universities, I think they see little in it beyond its possibilities in the way of future sitting upon platforms at public functions. For the foe that seems hardest to vanquish is still the ambition of parents to see their children parading their laurels, won in whatever field, in the social world; and the Southern thirst for a little cheap fame is surely no less deadly a blight upon educational prospects than the Northern spirit of "commercialism."

Is it then unfair to say that at the root of these various phases of the educational malady is the colossal self-satisfaction which has grown out of a section's habit of exaggerating the virtues of everything that is its own?

I have recently seen a catalog of a very second-rate (if not third) institution, in which nearly every professor was stated to be the best teacher of his subject that the president and trustees had ever seen; and I think they were not consciously lying. There is simply so widespread a lack of discrimination between the superficial and the substantial, and Greek, science and the like are names suggestive of such vast educational mysteries, that merely to have dabbled in them sheds a halo around one, and an admiring public is offended neither by the absurdity of such claims nor by the taste which thus advertises them.

The South has men and women of thorough education and sound judgment. During the past ten years especially, in which the graduates of its better institutions have begun to make themselves felt as a strong factor in public sentiment, there has been an advance in educational work and a raising of its grade which only prejudice would ignore. But until these men and women shall have been able to teach their people to compare their educational achievements honestly with those of other regions it cannot but be "a belated section."

Editorials

The Princeton Plan

THE authoritative account, written for THE INDEPENDENT by President Wilson, of the educational experiment which begins at Princeton University this fall will be read with deep interest by teachers and parents because it corrects some wrong impressions that have gone forth and because it clearly presents the fundamental problem of advanced educational methods.

Of three possible ways of dealing with the student who has passed beyond the secondary school the American college has hitherto been the chief exponent of one, the English university of a second and the Germany university of the third.

The American college until recently has assumed that its business was to discipline and to teach, and that this business could best be conducted by the simple method of holding recitations and examinations. Grammars, texts and manuals have been placed in the boy's hands, and these he has been expected to memorize and to repeat in recitations, themes and examination papers. Education, according to this plan, has consisted chiefly in the acquisition of accepted knowledge, in the acquisition of habits of accuracy and of systematic application. Independent thinking has been discouraged, rather than encouraged, and there has been little attempt to develop habits of research.

An increasing demand for something broader and more vital than the college drill has been met in American educational development by the multiplication of great universities, all of which have followed rather closely the Johns Hopkins model, which was avowedly borrowed from Germany. The German university has been, until recently, the exponent of untrammelled research. It has assumed that the university student was an adult, already disciplined in habits of systematic application and of accuracy, and that his chief need was of opportunity and appliances. He has,

therefore, been "turned loose" to work for himself. Lecture courses, seminars and laboratories have been freely opened to him. The university lecture at its best has been, not a summary of knowledge to be found in the books, but a first hand statement, by a professor, himself an investigator, of the latest developments of method, the latest reshaping of problems, and the latest formulation of conclusions in his own department; a giving out, in short, of things not yet available in print. Too often, however, especially in America, the university lecture has in practice been a condensed statement of information that the student might better obtain for himself from easily accessible books, and too often the student has depended upon his imperfect notes of lectures heard, rather than upon wide and intelligent reading, and he has come up for his doctorate examination with inadequate and superficial knowledge.

The English university has long followed a middle course between the method of the American college and that of the German university. It has assumed that the college student needs something more than a schoolroom drill, but that he is not yet ready to take the shaping of his intellectual life wholly into his own hands and to go forward without guidance. The English tutor at his best is both a guide and a fellow student. Limiting his attention to a rather small group of students, each of whom he can know intimately, he reads, talks and advises with each on a basis of dignified but friendly informality. He sees to it that the student becomes acquainted with a wide range of books pertaining to his subject, and that, above all, the really important books are not overlooked. He makes sure that in this reading the student fixes his attention upon the essential and critical problems. These are discussed. The student is encouraged to question, to ask why; in short, to think. The aim, in a word, of English university training is to create

a broad, critical and thorough understanding of the subject studied.

Each of these educational methods has its own characteristic merits. No man is thoroughly prepared for the intellectual life who has not been to some extent subjected to each one. They are, however, adapted to different stages of mental development. The older American college drill was perhaps the best device ever employed to create those habits of application and accuracy which are the indispensable foundation of further mental progress. Nothing can take the place of the true university method as a preparation for a career of research. But it happens that a large majority of American college students to-day have by the end of their freshman year, unless their time has been inexcusably wasted, gotten beyond the stage of possible benefit from the mere recitation drill, and they are not yet ripe for the work of independent, unguided research. The exact thing that they most need is a year or two of intellectual broadening and deepening. They need, as President Wilson admirably puts it, to learn how to master not a text-book, but a subject. They need to know more about it than they can learn from the cramming of a manual, but they are not yet ready themselves to broaden or to re-create it by their own original research. They need, in a word, to understand it as it stands to-day, the product of the creative activity of many minds that have worked at it hitherto; to understand it in all its existing length and breadth and depth; to know what each discoverer or scholar has contributed to it, and to begin to think discriminatingly, critically, upon the relative values of the various contributions.

This broad and thorough training of the comprehending, the discriminating, the understanding intelligence, is beyond question the immediate need in the American higher education to-day, and Princeton University has shown a real grasp of the situation in establishing its preceptorial system. For, as much experience has demonstrated, this system is the only one that can actually provide the kind of training here described. We are confident that Princeton is taking the lead in a movement that is destined to

have far-reaching consequences of inestimable value.

Painless Education

PRESIDENT HADLEY'S article on "The Study of Greek in American Colleges" will probably be disappointing to some readers. Educated men in reading an article on that subject naturally expect to lose their tempers—that is, to become unduly elated or irritated, as they happen to agree or disagree with the writer. But in this case the customary emotional thrill is not likely to be excited, for Peace Commissioner Hadley sums up the results of the conflict in so calm and impartial a way that neither Greek nor Barbarian, even of the intolerant type, can find much to object to. The battlefield is now so cleared of its smoke—smokeless polemics were not used when it was fought—that he is able to give the same verdict that historians have always given in regard to the wars of history, both of sword and pen—that is, that the whole affair was a misunderstanding, that both parties meant well and that they both argued from false premises to correct conclusions, that both won the victory for whatever there was of right in the cause for which they contended and that both are disappointed in the result, which, nevertheless, is more beneficial to mankind than the complete triumph of either would have been.

The battle has left two or three permanent acquisitions to educational theory, or, at least, let us hope they are permanent. It is no longer held that the process of education can be made entirely painless, nor, on the other hand, that it should be made unnecessarily painful. Educational practice has passed through the same stages as medical practice; from the extreme allopathic belief that any study was beneficial if it was bitter and taken in large doses we went to the extreme of homeopathy, that any study taken in infinitesimal doses and sugar-coated would answer all purposes. Now the pendulum seems to be settling from its violent vibrations into the common-

sense position, that the student should take whatever is good for him regardless of palatability.

When there was so much talk about the importance of interesting the student, some teachers, and, what was worse, many students, got it into their heads that it was the aim to make a subject so interesting that its acquisition would be easy. This is a very different thing from the true idea, which is, of course, to make the subject so interesting that the students shall be willing to work hard at it. Under the influence of this popular misconception of the duty of the teacher to interest, the students came to believe that they were doing all that could be expected of them if they seated themselves before him and showed as much good will and receptivity as they would give to an after-dinner speaker or a vaudeville entertainer. The method of educating by amusing does not work well in college, and its success is doubtful in the kindergarten.

On the other hand, we do not find it necessary to introduce hurdles into the college race course. There are enough natural obstructions, if they are not dodged, in any subject worth studying to develop wind and muscle. If a course does seem too smooth, all that is necessary is to make the boys run harder.

Fortunately, most of the science studies which have in part replaced Greek are not snap courses. Students who are lazy or pressed for time generally cut science in favor of the more humane humanities. A student, or, rather, an attendant at college, whose object is to get through easily or to get high grades will not, for example, take an elective in chemistry or physics when for the same amount of time and mental exertion he can take two or three studies in English.

Experimental psychology has been snatched from the hands of the contestants in the late war a favorite weapon with both parties, the belief in the spreading of special training. We now know that acquiring skill in estimating lengths of about an inch does not help one much in estimating

lengths of about a foot, that much practice in picking out a certain letter on a page of print will not prevent one from being very awkward in picking out some other, that playing chess does not make one a great military strategist, that the study of geometry does not materially improve one's ability to reason logically about other things than angles and circles.

But altho recent investigations have shown that there is little ground for thinking that specific training can be applied even to allied subjects, the case for "disciplinary studies" in the true sense has not been weakened by the loss of this argument. For we realize more than ever before that the two most important qualities of the really educated man, the habit of industry and the power of concentrated thought, can be cultivated by the proper teaching of almost any subject, and that these can be utilized in any fields of endeavor, however diverse.

The Pursuit of Land Thieves

SENATOR MITCHELL deserved to be convicted and punished. The official record of the case leaves no room for doubt as to that. He had full knowledge of the statute that forbade him to use his influence, for pay, in support of claims pending in an Executive Department, and he had before him the fate of Senator Burton and Representative Driggs, which ought to have served as an effective warning.

But he has not yet been connected directly with the public land frauds in Oregon, as a beneficiary of them (beyond the fee paid to his law firm for his plea in behalf of certain claims), and it should be understood that his offense was separated from the body of those frauds. We do not see that the consummation of those robberies depended upon his request for favorable treatment of certain claims as to the validity of which there was some doubt in the Interior Department. If, however, his intervention was really an important part of the thieves' scheme, and if he was to have a share of the plunder (beyond the small fee paid to his firm), then he deserves greater

punishment than six months in jail and a fine of \$1,000.

We say this because the public land frauds in the United States have been the worst offenses of this kind ever known. They have been in progress for many years, and to make them successful a large variety of crimes have been committed. Those who planned them and were enriched by their own dishonesty have exerted a powerful influence in politics and upon legislation, to the injury of the people.

By a continuous, shameful and unpunished violation of the laws, enormous tracts of land have come into the hands of a few men. It has sometimes happened that money dishonestly obtained from the Government by other kinds of wickedness has been used to promote land frauds for the further profit of scoundrels who thus in time became great landed proprietors. A considerable part of the stealings of the rascally Star Route contractors of twenty-five years ago was invested in the fraudulent acquisition of great areas of public land. In all these years none of these rich land thieves has been prosecuted to conviction and punished. Occasionally there has been an indictment, which came to nothing. Benson, the millionaire who is soon to be tried in Washington, was first indicted nearly twenty years ago, and, in all, more than eighty indictments against him have been returned by grand juries; but until now he has escaped.

Powerful land thieves have procured the appointment of Federal officers of their own kind, and have corrupted others whose aid they needed. Corruption has at times controlled the General Land Office at Washington. Some men who realized the extent of these frauds, who saw the demoralization of public opinion in certain States or Territories where the thieves had been notably successful, and who knew how great were the obstacles which prosecutors must encounter, have despairingly declared that the stealing could be ended only when there should be no more public land to be stolen; and they have longed for the time to come when the supply should be exhausted.

The conviction of Mr. Mitchell was well deserved, but the stealing of the

public lands can be prevented only by a determined prosecution of the hundreds of perjurers who have been indicted, by a campaign against the men who employed these perjurers, and by an honest and vigorous administration of the General Land Office and the Department with which it is connected. We believe that this is the kind of administration the country will see in the Interior Department so long as Ethan Allen Hitchcock shall remain at the head of it.

Mr. Hitchcock, now in his seventieth year, is a man of courage who believes that the laws should be obeyed and that those who violate them should suffer for it. This interesting attack upon the land thieves is his work, but we are not aware that he has ever boasted of it. He is a quiet man, who never seeks to advertise himself. The task which he undertook was one of much difficulty, because of the political influence of many of the beneficiaries of fraud, and also because they had agents and friends intrenched in official places. Obstacles of this kind could not restrain him or change his purpose. He went on with his work, collecting evidence that has now served as the warrant for hundreds of indictments in half a dozen States and Territories. "It has been my determination from the beginning," said he in his annual report of two years ago, "that the matter should be probed to the bottom, regardless of the apparent influential character of some of the men involved; and the inquiry has been conducted throughout along these lines." Several things have happened since that brief statement of his purpose. Among them are the conviction of a Senator of the United States and the indictment of two or three members of the House, together with hundreds of other men directly interested in the frauds.

Here is a man who deserves the support and the admiration of the people. He has made no proclamations, he has not boasted, but, as the President would say, he "makes good." In some respects his campaign against the land thieves has been a movement of more importance than Bristow's against the thieves in the Post Office Department. His views as to the obligations of a public officer are more commendable than those of Acting Secretary Loomis, and his achievements

as a member of the Cabinet have surely been as great as those of Secretary Morton were. Several newspapers have expressed surprise because the President has not given to Mr. Hitchcock and his work the support of his approval in some public utterance. But they should remember that the conditions may not yet have offered an opportunity. We are confident that when the time is ripe the President's public appreciation of Mr. Hitchcock's integrity, fidelity and courage will be so just and emphatic that all the Secretary's friends and admirers will be satisfied.

Killing Dangerous Animals

IN India every year several thousand persons are killed by tigers and serpents, and the Government is making great efforts for their extermination, by offering rewards and calling for the assistance of sportsmen. The animals most dangerous to the human race in every country are, however, of much smaller size and much more difficult to exterminate. We allude, of course, to flies and mosquitoes, which by spreading the germs of disease are slaying thousands among us every week. Is it not possible to direct against these, our real enemies, some of the in-eradicated sporting instinct of man? We hunt the wolves for killing our lambs, the rabbits for girdling our trees, the crows for stealing our corn, the hawks for catching our chickens; why not get the same fun and do more good by hunting insects? Instead of chasing the comparatively harmless fox or the still more innocent anise-seed bag, let the red-coated huntsman turn against the mosquito as game more worthy of the chase. Against such sport not even the Society for the Prevention of Cruelty to Animals would have a word to say.

As it is now the defense of the home against these most dangerous of wild animals is left chiefly to the women, who maintain an incessant but irregular and ineffective warfare against them, shooing them out of the house with towels, poisoning or catching them with paper, sweeping them into water pails, hitting them with newspaper cudgels or wire whips or seizing them by the slow and primitive way of thumb and finger. But

it is altogether improper to leave this task to the women. It is not woman's sphere. We appeal, as all sociologists do nowadays, to prehistoric savagery, and we find that man is properly the huntsman of the family and its defender against its foes. Man is the destroyer and woman the conservator. These generalities are so handy to use in argument that it is no wonder they are so popular.

Is there no spark of chivalry left in degenerate man which could be fanned into a flame? In every street there is an Andromeda, helpless, beauteous and innocent, about to fall a victim to a dragon more hideous, when seen through a microscope, than that which Perseus slew. A dragon of monstrous form, with a thousand eyes, with six legs and two wings and armed with a complete set of surgical instruments, including a hypodermic inoculating syringe loaded with disease germs, is no mean antagonist for any hero. In the days of old when knights were bold the jinns, dragons and ogres, which by their magic power could become invisible or take the form of some small animal, were the most dreaded of all. Loki took the shape of a horse-fly to stop Brok's work at the forge. A fifty-foot vegetarian dinosaur from the Jurassic Period, with case-hardened scale armor, could be easily put out of commission by a modern explosive shell. And even if he were vomiting flames from his mouth, as the dragons of a later age are reported to have done, a hand grenade charged with soda water would put a stop to that without there being any need to send in a fire alarm. Far more dangerous are the dragons, large and small, that spread the plague, like the one St. George killed:

"A dreadful dragon, fierce and fell,
Who by his poisonous breath each day
Did many of the city slay."

Our American poets, if we have any, should sing of the deliverance of Havana from the yellow fever. A modern Raphael, if there is one, should paint Major Ross as a modern St. George slaying Anopheles. When we know what are our true enemies we will know who are our true heroes. Yet this evening, when some young Siegfried sitting upon the porch of the hotel kills a mosquito whose buzzing annoys the summer

girl by his side, she thanks him without displacing his collar. Neither of them realizes that he may have rescued her from death as truly as if he had snatched her from the path of an automobile.

If chivalry is not a sufficient motive to rouse us for the fight, let us appeal to religion. Let us have a revival of the religion of Zoroaster, which teaches that killing a noxious insect is as meritorious as saying a prayer, and that he who drains a swamp is as he who builds a church. Let us keep our Buddhism for the winter and be Zoroastrians all summer, swearing relentless warfare on the death-dealing diptera. If we could get rid of all the flies and mosquitoes the world would be freed from its fear of cholera, bubonic plague, typhoid, malarial and yellow fever.

The Lesson of the "Bennington" Disaster

SECRETARY BONAPARTE has asked for a suspension of public expression of opinion concerning the boiler explosion on the United States gunboat "Bennington" until after an official investigation shall have been held, which he assures the country shall whitewash nobody nor make any one a scapegoat. Under circumstances of sudden and *prima-facie* unaccountable accident, this request, in justice, should be heeded. Such circumstances are manifestly not here present. On the contrary, this disaster, like several other in the Navy which of late years have taken place, needs no investigation to discover its underlying cause, nor will that obvious cause be made any plainer by the possible fixing of personal responsibility. Its well-spring is in the ill-considered Personnel Act of 1899, which abolished the corps of skilled engineers which the Navy had possessed ever since steam became the chief motive power of war ships, and substituted young line officers of no special training or enlisted machinists equally without experience in the management of war ship engines.

The obvious and dangerous possibilities of that measure were urgently represented to Congress. Mr. Park Benjamin in these columns again and again showed it to be fraught with disaster. He

pointed out that the calling of the mechanical engineer is wholly distinct from that of the seaman—that the duties of sea officer and sea engineer were never combined, and that

"There is not a single steamship line in the world, much less a navy, where such amalgamation has ever taken place, or where there is even a probability that it will take place. The navigating and engineer forces of all modern steamships are always kept separate."

It was further shown that so far from despecializing naval engineers, the increasing complexity of propelling machinery of our war vessels more than ever demanded specially skilled men. "So urgent," it was said, "have we deemed this necessity in the past that we have not trusted the engines of our war ships to the same class of men to whom we trust our locomotives and the engines which drive our factories, but insisted that the naval engineer should be not merely a skilled mechanic, but an officer highly educated in both theory and practice of steam engineering." It was pointed out that a line officer was already required to be "a sailor, a gunner, an international lawyer, a diplomat, a chemist" (and since this was written in 1898 he has been called upon to run railroads and manage custom houses), and that if in addition there was to be demanded of him the acquirements of a professional naval engineer, the results "if not dangerous and impracticable," would be "at least far from calculated to secure us the best talent."

The measure, despite all that could be said, was "jammed through" Congress, and the most complex mechanisms ever embodied by man in single structures were deliberately put into the hands of people unskilled in their management. In plain English, the motive power of our war ships, on which their efficiency and our national safety depends, was deliberately intrusted to tyros and boys.

Hardly had this precious law been enacted when its principal advocate, Rear-Admiral Melville, Chief Engineer of the Navy, virtually repudiated it and expressed grave apprehension as to its results. Nor has he since ceased to point out in his candid and vigorous way—

despite attempts to muzzle him, in which hints of a court martial have not been wanting—the dangers involved. There has been one long record of smashed machinery, ships laid up for repairs and disabled torpedo boats. He has not hesitated to attribute this to nothing but ignorant and careless handling. No other navy, no steamship line has followed our experiment. It is a miserable failure; so confessed, in fact, by the present proposal on the part of the Navy Department that officers shall be segregated for special engineering training—an effort quietly to reorganize the old engineer corps.

We have now afloat a dozen battle ships and half a dozen armored cruisers costing from three to seven million dollars each, also some twenty protected cruisers and monitors of the second rate and fifty smaller cruisers, also gun boats, torpedo boats, auxiliaries, etc.; in brief, a world-power navy. For sea duty on these we have now left of the old educated engineers just sixty-three men. Saving these, the engine rooms are filled with mechanics taken from the shops and benches ashore and young graduates from Annapolis—not one of them trained as a naval engineer. And every ship of which they are in control of the machinery is in peril all the time.

An "investigation" may prove the Bureau of Steam Engineering to have been negligent or ignorant; or this or that youth in charge of the boilers to have been destitute of experience beyond his years or which he never had opportunity to acquire; or that the "Bennington's" boilers were not thought to be as bad as they were. And this done the public, which pays the bill, and especially that section of it which is weeping over the graves at San Diego, will no doubt be told that all is satisfactorily explained.

There is but one explanation—official incompetence—the legitimate plainly foreseen result of the project invented by "Fighting Bob" Evans, promoted by the late Assistant Secretary of the Navy as the solution of a thirty-five-year-old problem "right here and now," advocated in the *North American Review* by the Hon. George N. Foss and associates, and created by Congress deliberately sinning against the light.

For the precipitancy, for the ignorance, for the stolid refusal to heed not merely the strictures of the opponents of the scheme but the repeated and solemn warnings of its former ablest advocate and supporter—for the present awful and disgraceful disaster and its impending successors, it needs no investigation now to see where the responsibility belongs.

"Callicere" Things are never settled until they are settled right. Now comes Gen. Samuel Pearson, late of the Boer Army, who has just returned from Venezuela, with a most significant letter about the Loomis scandal in the *Evening Post*. Says the General:

"It appears to me that Mr. Bowen's chief offense, and that for which he was dismissed from the Department of State, was for talking to newspaper men on a subject which was and is of great notoriety in Caracas."

That being the case, he asks if "the relationship existing between Mr. Loomis and the newspaper press is not equally censurable." He, therefore, turns to page 127 of the official "Blue Book" of the Loomis inquiry and makes the following extract from a letter from the Caracas agent to the President of the Asphalt Trust:

"CARACAS, VENEZUELA, March 24th, 1901.

"Dear Sir.—Callicere sends by this steamer his check for \$6,000 drawn upon the National City Bank, New York. Will you kindly deposit this sum to his credit?"

"Callicere is anxious that the newspaper part of the campaign be carried out. He suggests the employment of W. E. Curtis as a special correspondent. The Associated Press has instructed Jaurett, its correspondent here, to send nothing unfavorable to Warner & Quinlan, and intimates that he has been very prejudiced. Curtis is an exceedingly good man to state facts to the Associated Press, and as he is an authority on Venezuela, anything that he may print will have weight. Very respectfully yours,

"(Signed) HENRY WILLARD BEAN.

"To Gen. Francis V. Greene, No. 11 Broadway, New York City."

Who was this "Callicere," who expresses great anxiety that the "newspaper part of the campaign be carried out?" On page 149 of the same "Blue Book" Mr. Clyde Brown testifies that "Callicere"

was the code name for Mr. Loomis. Of a surety it was desirable to conceal the name of Loomis, says General Pearson, because

"he was entrusted by the United States with delicate negotiations (when not engaged in personal enterprises, claims, contracts, concessions and the like). It would have been awkward to have it appear that all the time this was going on he was also anxious to have 'the newspaper part of the campaign carried out.' There were two American companies contesting for the asphalt lake at the time, and the representative of the Associated Press had been instructed to send nothing unfavorable to the Warner & Quinlan interests. Under such conditions the impropriety of Mr. Loomis in stimulating 'a newspaper campaign' through the other company and naming the campaigner is obvious."

We are glad, as we said last week, that the "Blue Book" of this departmental inquiry has been ordered by the President sent to every member of Congress. Tho incomplete and one-sided there is plenty in it to interest those searching for the truth, whether it be the conduct of Mr. Loomis while Minister to Venezuela or the relationship of the Asphalt Trust to the United States Government. But the reasons why Mr. Loomis retains his influence with the administration becomes more mysterious every day. Yet we cannot believe that the *Evening Post* is well informed when it says "It is said that the President has peculiar and private reasons for standing by Loomis."

Porto Ricans for Home Rule

Congress and the President ought to be impressed by the character of the recent convention in Porto Rico, as well as by the propositions or demands of the memorial which it adopted. It was a serious and dignified assembly, representing both political parties, composed of delegates from 65 of the 66 municipalities, and disturbed by no partisan political demonstration whatever. Complaining that the island is now governed absolutely by an Executive Council whose members are appointed at Washington by Mr. Roosevelt, and who come to Porto Rico with no knowledge of the people and their needs, the Convention asks that this Executive Council be dis-

placed by an elected Senate of fourteen members, and that the heads of executive departments (who now constitute the Executive Council) shall be appointed by the Governor with the consent of the proposed Senate. The desire of the Porto Ricans for a larger measure of self government (their present measure being practically nothing) is natural and commendable. It should be met by substantial changes in the direction of such home rule as our Territories enjoy, altho it may not be wise to go as far, in one step, as the memorialists desire. It may have been expedient and for the best interests of the islanders, seven years ago, to begin with such a Government as now exists, but that Government should not have been permitted to remain for seven years without modification. The truth is that we have neglected the island and its people, continuing the imposition upon them of a Government which has emphasized this neglect by its disregard of insular aspirations and needs. To this, and to our absurd and exasperating denial of citizenship to Porto Ricans, have been due the anti-American feeling which is now noticeable on the island, and the failure of Americans to invest capital there for the development of local industries. Congress should take up this memorial next winter with a feeling of friendship and respect for those who signed it, and should speedily make substantial concessions in the direction of home rule.

More Than a Million Immigrants

During the fiscal year ending with June last, 1,027,421 immigrants entered the United States. This far exceeds the number entering in any previous year, the largest number heretofore having been 857,046, in 1903. When comparisons with the record for 1904 are made, the following changes are seen: Austria-Hungary, rising from 177,156 to 275,693, stands at the head, displacing Italy, which advances from 193,296 to 221,479; the Russian Empire shows an increase from 145,141 to 184,897; England, Scotland, Ireland and Wales are fourth in the list, with an increase from 87,590 to 137,057; from Norway, Sweden and Den-

mark, 60,625 came, against 60,096 in 1904; Germany's number has fallen from 46,380 to 40,576. From China, 3,057 came in 1905, and 4,309 in the preceding year; the number entering from Japan fell from 14,264 to 10,332. As the total in 1904 was 812,870, the increase exceeded 26 per cent. Since 1820 we have received 22,932,905 immigrants. At the head of the list stand the following countries: England, Ireland and Scotland, 7,286,357; Germany, 5,187,094; Italy, 2,000,252; Austria-Hungary (all since 1861), 1,971,431; Scandinavia, 1,730,722; Russia, 1,452,629. No other country has contributed more than 450,000 to our population. There is no lack of those who see great dangers in this vast stream of people ever flowing to our shores. We are glad, however, that THE INDEPENDENT has consistently welcomed them, and recognized that they have benefited us as much as we have them.

Casualties on the Fourth There was a considerable increase in the number of casualties on the Fourth, this year, but a reduction of the percentage of fatal cases. This was due to regulations in many cities designed to prevent the use of toy pistols and blank cartridges. Enforcement of such regulations in Pittsburgh, for example, appears to have prevented any deaths from lockjaw, altho there were nearly a score of deaths from this cause there after last year's Fourth.

The White Mountains If the slopes of Mt. Washington were in danger of being shorn of their forests, the people and the State of New Hampshire could well afford to protect them by purchasing the entire tract for a reservation. We do not understand that the recent sale of 70,000 acres on those slopes will hasten the removal of the trees, or that the establishment of a reservation has been made more difficult by this transfer of property. There should be a national Forest Reserve in the White Mountains. New Hampshire will not make one there, nor can it reasonably

be expected that other States whose water courses are affected by the condition of those mountains will take any measures to guard their interest in them.

A Russian Mirabeau

"There are no true historic parallels," said Lord Acton. This may be chalked upon the blackboard beside the old saying, "History repeats itself," and both canceled, leaving us free to make such comparisons as we choose between similar events. The attempted dispersal of the Zemstvo Congress at Moscow by General Trepov is strikingly analogous to the scene enacted in Versailles in 1789, when Mirabeau made his famous retort: "Go and tell those who sent you that we are here by the will of the people and nothing but the power of bayonets shall drive us hence." Last week, when five police officers entered the palace of Prince Dolgorukov to disperse the meeting of the delegates of the zemstvos, which had been authorized by the Czar before his last reactionary relapse, the Prince called the members to order with the words: "The policemen are only doing their duty. Let us do ours and proceed to business without wasting any time." And when the Chief of Police began to take down the names of the delegates in order to make out warrants for their arrest, the members called out to him: "Write down the whole of Russia." But a witty retort does not make a revolution. Count Mirabeau's remark is historic because it was true that the Third Estate was there by the will of the people. Whether the whole of Russia is with the zemstvoists in their struggle for a representative government is a question for the future to decide.

Maimed Rites

The method adopted by the Catholic Bishop Ludden, of Syracuse, for checking the desecration of Sunday by refusing to allow "the honor of Christian burial to those who die by accident on the Lord's Day, having culpably violated its duties and obligations," is reported to have received the approval of Andrew D. White, formerly President of Cornell

and Ambassador to Germany. If Dr. White will read a book entitled "The Warfare of Science with Theology" he will find in it much interesting information on the use of such ecclesiastical penalties in the Middle Ages. There are other great evils that might be attacked in the same way. For example, we understand that the taking of interest for the loan of money is frightfully prevalent at the present time, and in accordance with the injunction of Pope Gregory X persons doing this ought to be denied Christian burial. And will it be long before some zealous ecclesiastic advocates the revival of the old English custom of burying a suicide at the crossroads with a stake driven through his body? There are, however, certain practical difficulties involved in posthumous punishments. They do not reach the right people. Only a small proportion of the people who go on Sunday excursions get killed. The old belief in an unusually high rate of fatalities on such occasions is not supported by statistics. Those who were struck by lightning last Sunday at Coney Island, were they sinners above all others? The man who goes fishing on Sunday and gets drowned does not need any additional penalty, and some good Christian can probably be found who will say a prayer over his grave if the Bishop of Syracuse will not. But something ought to be done to the man who comes home with a big string of fish and boasts of a good time.

Ushers and Strangers Dr. Lucien C. Warner, of this city, gives us the following bit of personal experience at a New York church:

Last summer a minister of wide reputation was preaching at one of the prominent churches in New York City and, as my regular place of worship was closed, I naturally went to this church. I was ordered about by the ushers from one part of the house to another and made to feel that it was a special favor on their part to permit me to occupy a seat, altho there was plenty of room and most of the pew-holders were out of the city. The same experience was repeated for three Sundays, after which I went no more.

Recently I attended the same church again, with my wife, to hear the pastor, whom I

greatly admire. To avoid unpleasant waiting at the door we purposely went a little late and were very promptly shown by the usher into a vacant pew near the door. About two minutes later another usher came and requested us to vacate the pew as the owner wished it, and we would be shown into some other seat. A lady, who was the only occupant of a pew immediately forward of us, said that we could sit with her, and, crowding past her, we found seats for the service. No apology was offered for the discourtesy shown us by the ushers or by the people who claimed and occupied the pew. In fact, there was a business air about the whole transaction that seemed to imply that it was the regular and proper treatment of strangers who had been given a seat by an usher.

There has been much discussion of late as to how the churches are to reach the non-churched masses. Special evangelistic services have been held and earnest, but not very successful, efforts have been made to reach the unconverted. Suppose one of these non-church goers had been in my place on this recent Sunday morning; what would be his chance of repeating his visit to this church? Or suppose this church desires to increase its membership and attendance? Where are the accessions to be secured if not from those who first come as strangers? In a club no one has any rights except members and guests who are specially introduced by a member; is there not danger that some of our Christian churches are unconsciously working toward the same code of ethics?

It is to be hoped that the case of Professor Mitchell in the Methodist School of Theology in Boston will be settled somewhat more satisfactorily than that of the distinguished English Methodist, Prof. J. Agar Beet. Five years ago, at the request of his friend Hugh Price Hughes, he withdrew from publication his book "Last Things," which argued against the doctrine of eternal sin. He did this for the sake of peace, at the time when the British Methodists were preparing for their Century Fund. But still he finds objection made to his views, and that he may be at liberty to republish his book he resigns his professorship at Richmond College. The paper of which Hugh Price Hughes was editor seems content and reminds him that professors are not appointed to discover truth, but to teach what the Church believes.

Insurance

Mr. Morton Elected President of the Equitable

At a regular meeting of the directors of the Equitable Life Assurance Society, on the 26th ult., Mr. Paul Morton was elected President of the Society, to succeed Mr. James W. Alexander, whose resignation was accepted some weeks ago. At a subsequent meeting the office of Chairman of the Board, which Mr. Morton had held, was abolished. Judge William A. Day was elected Comptroller, to succeed Thomas D. Jordan. It was shown by Mr. Morton that the curtailment of expenses already accomplished represented an annual saving of \$500,000. The Board practically decided that hereafter no director should participate in any syndicate underwriting or similar transaction involving the Society's funds. Upon the report of a special committee several pensions have been discontinued and others have been reduced. A statement of the Society's business for the last six months showed an increase of \$7,296,000 in assets. Policies issued during the six months were less by \$15,422,000, or about 9 per cent., than those issued in the corresponding six months of 1904.

In our recent comments upon the condition and management of the Society we have expressed the opinion that the selection of Mr. Morton for the office of Chairman of the Board was not one of ideal excellence. It has seemed to us that the Society ought to be mutualized completely, and that not only stock control, but also control by what are called Wall Street influences, should be eliminated. Mr. Morton has now, however, been made President by the action of a Board largely composed of new members who were chosen in accord with the new policy. It is but just to say that the acts of his administration, during his term of service as Chairman, so far as they have come to our knowledge, have been in the interest of such reform as the policy holders desire. He has reduced excessive salaries, terminated pensions that were unwarranted, caused the removal of

officers whose continued connection with the Society would have been injurious to its interests, and provided for a thorough examination of the Society's finances by disinterested experts. This is a good beginning, and it may fairly be regarded as indicating the policy which Mr. Morton, as President, intends to pursue. We shall take pleasure in recognizing hereafter the further evidence of his determination to institute reforms and to conduct the affairs of this great company for the best interests of the hundreds of thousands who have relied upon it for so many years.

IN commenting upon the semiannual statement of the Home Insurance Company two weeks ago we made an unfortunate error which caused the increase in surplus to appear \$1,000,000 too small. The actual gain in surplus for the year ending July 1st, 1905, was \$1,689,169.14.

.... At the last regular meeting of the directors of the American Fire Insurance Company of Philadelphia Mr. John H. Packard, Jr., was elected President, to succeed the late T. H. Montgomery, and Mr. Waite Bliven was elected Secretary. Mr. Packard has been filling the position of Vice-President and Secretary till his present advancement. He is eminently qualified for his present position by a long and practical experience in all phases of insurance business. After his course at the University of Pennsylvania he entered the fire insurance office of Thomas C. Foster in 1895. Later he made connection with the American Fire Insurance Company, becoming City Surveyor. He was elected Assistant Secretary of the Philadelphia Underwriters' Association in 1897 and in 1902 he was elected Vice-President and Secretary of the American Fire Insurance Company. Mr. Packard comes of one of the old Philadelphia families and is a member of the leading social clubs of that city. Mr. Bliven is called from Chicago, where he was one of the company's most valuable and active field men. The statement of the American Fire Insurance Company shows a cash capital on hand of \$500,000, total assets of \$2,838,795.80, and surplus over all liabilities \$222,677.40.

Financial

Steel Corporation's Quarter

THE report of the United States Steel Corporation for the quarter ending with June shows net earnings of \$30,305,116, against \$23,025,896 for the quarter immediately preceding, and \$19,490,725 for the corresponding quarter in 1904. Unfilled orders on hand, however, have declined to 4,829,655 tons on June 30th, from 5,597,560 on March 31st. Evidence of a prudent policy with respect to depreciation, replacements, etc., excites favorable comment. The quarter's charge for depreciation and reserve was \$5,009,563, against a little more than \$3,000,000 in last year's corresponding quarter. For special improvement and replacement \$1,000,000 was assigned, and \$2,500,000 was set aside for contemplated appropriations and expenditures. For the purchase of additional property \$5,000,000 was deducted from the net. After the payment of interest and of dividends on the preferred stock, \$3,070,681 was carried to the surplus account.

Increasing Bank Circulation

SECRETARY SHAW gives notice that on and after August 1st the Philippine land purchase bonds, Philippine one-year certificates, Philippine public works and improvement bonds, and the Manila sewer and water works bonds, in all amounting to \$13,500,000, will be accepted as security for existing deposits of public money in national banks in substitution for United States bonds now held as security for such deposits, "on condition that the Government bonds thus released be immediately used as a basis for additional note circulation." His admitted purpose is to stimulate an increase of circulation preparatory to the crop-moving period. If recently published reports are trustworthy there will be no large demand upon the East in the coming autumn for money to move the crops. It is asserted that the West was never before so well provided with the funds required for this movement.

THE MIDDLESEX BANKING COMPANY of Middletown, Conn., of which Robert

N. Jackson is President, will pay upon presentation, with interest to date of payment, the debentures maturing in October, November and December.

....Vice-President Whyte, of the Canadian Pacific Railway, says this year's wheat crop in the Canadian Northwest will be 100,000,000 bushels, against 55,000,000 last year. Conservative estimates do not fall below 80,000,000.

....The New York Central has added to its large holdings of trolley roads in the State of New York by acquiring control of the Rochester & Eastern Company, whose lines extend from Rochester to Geneva, by way of Canandaigua.

....An American shoe store in Frankfurt, Germany, is doing a large and increasing business. Similar stores have been established by the same firm in three other German cities, and the domestic manufacturers are calling for higher tariff duties on imported shoes.

....Bank Superintendent Kilburn reports that deposits in the savings banks of New York on June 30th amounted to \$1,252,928,299, and that the number of open accounts was 2,513,570. The increase of deposits during the year, \$85,836,855, was unprecedented, the largest previous increase having been \$71,336,282, in 1899.

....Lloyd's Register, recently published, shows that the world's ship tonnage has increased from 34,789,189, in 1904, to 36,000,893 in 1905. Those countries which have more than 1,000,000 tons (steam and sail) are as follows: Great Britain, 17,009,720; United States, 3,996,479; Germany, 3,564,798; Norway, 1,776,218; France, 1,728,038; Italy, 1,189,066. Many steamships under the British flag, however, are owned by Americans.

....Dividends announced:

Southern Pac. Co., interest (various bonds), payable August 1st.

Chicago, Milwaukee & St. Paul R'way, Preferred, \$3.50 per share, payable October 10th.

Chicago, Milwaukee & St. Paul R'way, Common, \$3.50 per share, payable October 10th.

Buff., Roch. & Pittsburg R'way, Common, 3 per cent., payable August 15th.

Buff., Roch. & Pittsburg R'way, Preferred, 3 per cent., payable August 15th.

NEW YORK, THURSDAY, AUGUST 10, 1905

No. 2958

Survey of the World

The Department of Agriculture

Further investigation has brought to light in the Department of Agriculture additional transactions that have excited some criticism. The grand jury at Washington is still at work upon the offenses of Assistant Statistician Holmes. Chief Statistician John Hyde, who resigned and at once sailed for Europe, has been asked by Secretary Wilson to come back. He replies that he will return without delay. He is wanted as a witness before the grand jury. After a long conference with the President last week Attorney-General Moody said that the Federal criminal statutes were so antiquated that they did not meet existing conditions. Congress will be asked to make them broader and more stringent. President Jordan, of the Southern Cotton Association, demands the removal of the Secretary, asserting that he is incompetent. The Secretary, in whom Mr. Roosevelt has confidence, says it would be cowardly for him to resign while his Department is under fire. Investigation is being made as to the connection of several prominent officers of the Geological Survey, as directors and stockholders, with a journal devoted to mining. It is asserted that much information obtained at the expense of the Government has been published by them in that journal long before the appearance of it in the official reports, which, it is said, have been unwarrantably delayed. It is asserted in similar charges against the Fish Bureau that much information has been published in magazines by officers, with illustrations, prepared by the Government, which have appeared in the official reports several months later. Dr. D. E. Salmon, the

well-known head of the Bureau of Animal Industry, is criticised by some because of his association with the contractor who supplies labels (invented by himself) for use in the inspection of meat. It appears that Dr. Salmon assisted this man some years ago and was his partner for six years in a small printing business. At Dr. Salmon's suggestion he invented the label, but Dr. Salmon withdrew from the partnership very soon after the inventor obtained his first contract, in 1901, and has since had no financial interest in the business. The inventor has been quite successful. Many millions of the labels are used by the Government. At present he is at the head of a business capitalized at \$500,000. Having elicited these facts, Secretary Wilson was inclined to discontinue the investigation of this case, but at the direction of the President further inquiries are to be made. It appears that Dr. Moore (who recently resigned) could have made himself rich by a commercial use of his discovery of a bacterial culture for the inoculation of soil. He took out patents, but gave the free use of the discovery to the people of the United States. Some say that he could have become a millionaire by the sale of it here and abroad. His resignation was due to public criticism of his conditional negotiations, terminated some time ago, with a company engaged in the manufacture of the bacterial culture which he invented. The Weather Bureau has been attacked by persons who asserted that \$60,000 was spent in erecting in the mountains of Virginia buildings which served as a kind of summer resort for the officers. Investigation, so far as it has proceeded, indicates that there was

no just warrant for such a charge. Independent slaughterers and beef packers have complained that they suffered in competition with the Trust because they could obtain no Government inspection of their products. Dr. Salmon's answer to this is that the export trade, which is controlled by the Trust, must be subjected to inspection; that the appropriations are not sufficient to provide for the inspection of meats for domestic consumption, and that the House Committee on Agriculture has warned the Department not to extend its inspection to the concerns engaged exclusively in the domestic trade.

Fifty Years of the "Soo" Canal

At Sault Ste. Marie, Mich., on the 2d and 3d, the fiftieth anniversary of the opening of the ship canal around the falls or rapids of the St. Mary's River was celebrated by naval and military parades, races, public addresses, etc., the most prominent guest being Vice-President Fairbanks. The canal was constructed by the State of Michigan, and was transferred to the Federal Government in 1870. Its traffic largely exceeds in quantity and value that of any other artificial waterway in the world. At the public commemoration exercises on the 3d, the leading address was that of the Vice-President, who began by welcoming cordially the many Canadians who had come to take part in the celebration. Pointing to the two great locks, side by side, one constructed by the United States and the other by Canada, he expressed a wish that their fellowship should "always be symbolical of cordial relations and neighborly regard of the two peoples through whose veins flows the blood of a common ancestry":

"We owe allegiance to different institutions. Above us are different flags, emblems of the mightiest Powers on this earth. We have no sense of rivalry except in those ways which make for a higher and better civilization. There are no fortifications along our common frontier, no battleships upon the waters which divide us. These are not needed now, and we trust that in God's providence they shall never be required. We are the respecters of each other's institutions, of each other's laws, of each other's rights. We are

bound to each other by strong social ties and sentiments of mutual respect. Competition in trade is a vitalizing factor. It is not born of unfriendliness. It has its inspiration in that just self-interest which has been the life of trade from the beginning until now. The national policies of the United States and Canada may not be in accord. If they be not, it will be due to no unfriendliness of purpose, but to that sense of duty which each primarily owes to its own."

The subject of the greater part of his address was the commercial development of the United States during the past half century. "The sceptre of commercial power," said he, "is speedily passing into American control. If we are but true to the vast opportunities which lie at our hands, the United States will become the acknowledged leader of the commerce of the world." Our commerce upon the lakes, he added, was carried in American-built ships manned by American seamen. But our commerce on the high seas was largely given over to ships built abroad and sailed by alien owners. This, in his opinion, seemed incompatible with a wise national policy.—To the Hon. Peter White, of Marquette, belongs the credit of originating the idea of this celebration, the success of which was due largely to his efforts.

The Fever in New Orleans Owing mainly to a bitter controversy between Louisiana and Mississippi concerning the enforcement of quarantine regulations, control of the epidemic of yellow fever in New Orleans has been given to the Federal authorities. The quarrel between Governor Blanchard and Governor Vardaman was caused by the attempts of the latter, by means of armed patrol boats, to exclude the boats of Louisiana fishermen from the partly inclosed waters near New Orleans on the north. There is an old dispute about the dividing State boundary in those waters, and it is now in the courts. On the 3d, when Governor Vardaman's patrol boats, carrying armed militia, were still on guard, Governor Blanchard sent a little fleet of launches and oyster boats to the disputed waters. The Naval Militia on board had been instructed to capture or disperse the invaders. Gov-

ernor Vardaman's forces had already taken possession of 18 fishing schooners and sent them to the quarantine station at Ship Island. On the morning of the 4th, two of his boats were captured by the Louisiana fleet, and their captains and crews were placed in jail. Fortunately no shots were fired. That afternoon, an important public meeting was held in New Orleans. The Mayor, the health officers of the State and the city, and representatives of all the financial and commercial organizations were present. All agreed that the time for calling upon the national Government had come. Resolutions were adopted asking the Federal authorities to take charge of the epidemic and pledging the hearty cooperation of State and city authorities. The request was telegraphed to President Roosevelt. He responded that he had asked Surgeon-General Wyman to report as to what the Federal authorities could do. The Surgeon-General proceeded to station in the city a sufficient force of Marine Hospital surgeons and workers.—The disease has been spreading slowly in the city, the average daily number of deaths having been about 6. At the end of last week there had been 505 cases and 97 deaths. At the end of the preceding week the numbers were 256 and 53. House-to-house inspection, with the use of oil and screens, has been continued. New Orleans has 45,000 cisterns, and in the war upon mosquitoes these must be screened or treated with oil. The new water and sewerage works, which will cost \$16,000,000, will not be completed until three years hence. The epidemic has thus far been confined, one or two persons excepted, to the Italian residents, some of whom have concealed fever patients by placing them on roofs or even in cisterns. Trains going northward have been crowded with refugees. At most stations armed guards have forbidden them to stop. A special train bearing 400 residents of Shreveport arrived at St. Louis one day last week, having run the gauntlet of a shotgun quarantine that compelled the passengers to make the journey with a supply of food and water that was almost nothing. On Saturday last, the Rev. Dr. Chapelle, Catholic Archbishop of Louisiana and Apostolic Delegate to Cuba and Porto

Rico, was attacked by the disease in a virulent form. Memphis, Charleston and other cities have adopted rigid quarantine measures. Memphis is surrounded by armed guards, and no one is admitted who does not show a written permit from the local Board of Health.

New York's District Attorney

William Travers Jerome, District Attorney of New York,

says to the public that he desires to be elected this fall for another term of four years and that he shall rely upon an independent nomination by petition. Such a petition requires 2,000 signatures. Altho Mr. Jerome is a Democrat in national politics, the Republican Club of New York at once offered to give him the signatures of 2,000 of its members. His action and attitude are approved by prominent Republicans, Independents and Anti-Tammany Democrats. Mr. Jerome in the last week of July began a series of attacks, by interviews in the press, upon boss rule and the machine control of parties. He denounced the Tammany leader, Mr. Murphy, for inducing the judges of the Court of Special Sessions to displace their chief clerk by electing to the office "an ex-bartender" named Culkin. On the following day he attacked Mayor McClellan, severely criticising his appointment of several persons to prominent offices. This was followed by some very frank remarks about certain bosses and Senators (neither party was spared) and by his call for a nomination by petition. He seeks "to break down the evil solidarity of the political machines" by going over the heads of those who control the machines and "directly to the people." He says:

"It seems to me that one of the greatest evils of the present time is that small groups of men have, and not infrequently a single man has, obtained control of the executive machinery of party organizations and nominating conventions and stand between the public servant and the voters. The result is that one in public office has to choose between a termination of his public career or subserviency to such a man or group of men. The public officer, as a consequence, frequently feels no responsibility to the people, but only to those who can

secure for him a return to office or future promotion. In the exercise of their power such men and groups of men are wholly selfish, almost entirely irresponsible, and not infrequently corrupt. A man who works with such a group and receives favors at their hands comes under implicit obligations which cannot honorably be disregarded. He cannot take office by their favor and still be free to deal with them and their demands as obedience to his oath of office requires."

The Philippine Islands

It has been reported by the press that Gen. Leonard Wood, who is now in Massachusetts, recovering from a surgical operation, would not return to the Philippines, but would be appointed to the General Staff. General Wood disposes of this report by saying that he intends to return to the islands a few weeks hence and expects to remain there for two years.—Secretary Taft and his companions left Japan on the 1st and arrived at Manila on the morning of the 5th, to be welcomed on board their ship by Governor Wright, Major General Corbin, Rear Admiral Train, and their staffs. They were greeted also by an elaborate water pageant, and by salutes from forts and war ships. Manila was brightly decorated for these distinguished guests. At the Governor's residence the golden keys of the city were given to the Secretary. Many entertainments had been provided—among these a grand ball in honor of Miss Roosevelt, and banquets by the Chamber of Commerce and prominent Filipino residents. The visitors are to spend two weeks in making a tour of the islands.

Porto Rico and Cuba

There were riots in San Juan on the evening of the 1st, in connection with the strike of the longshoremen for an increase of wages to 25 cents an hour. For some time the mob had possession of the streets. The rioters attacked the police with paving-stones. Two men were killed and thirty injured. As a rule, the police fired in the air. Governor Winthrop gave orders on the following day that they should shoot to kill, if the mob could be restrained

in no other way. If they need help hereafter, it will be given by the insular troops and by marines from the ships in the harbor.—Dr. Van Buren, Episcopal Bishop of Porto Rico, writing about the demand for home rule made by the recent convention, says that to grant all that the memorialists ask "would mean practically to withdraw all United States control and protection." They would be satisfied, he continues, with nothing less than absolute independence. A native Senate, he thinks, with power to confirm or reject appointments of the heads of Departments, would insist upon the appointment of natives only, and the conduct of native mayors does not "inspire confidence in an honest administration of the treasury by native appointees." The proposed change, in his opinion, "would mean Roman Catholic schools supported by the Government." This would "tend to the creation of a favored class, the continuance of widespread illiteracy and the gradual abolition of enlightening modern methods and subjects of study." He suggests that a Commission should be appointed to consult with leading natives, hear their grievances, make a thorough investigation, point out the principles which the United States is bound to enforce, and show that the interests of the people will not permit it to "hand over the reins of government to the native statesmen at their present stage of development."—In Cuba, an official inquiry concerning the burning of the municipal building and records at Vuel-tas has been followed by the indictment of the Lieutenant Mayor of that place and of the Lieutenant Governor of Santa Clara province (Señor Alverdi), who was acting as Governor in the absence of Governor José Miguel Gomez, a candidate for the Presidency in opposition to President Palma. The buildings were destroyed to prevent an investigation by a Commission sent to Vuel-tas by the insular Government.—In the House a bill is pending that provides for the printing of 50,000 copies of the Constitution, with the Platt Amendment left out. A motion that the Amendment be included was lost

by a vote of 16 to 15.—Governor Gomez has given to the public a statement in which he says that he will not allow the insular Government to inspect the municipalities of Santa Clara province. "If the Supreme Court," he continues, "decides against us in this matter, we shall not obey its mandate, because of its partiality in favor of executive authority. The court would be certain to oppose us in order to gain favor with the Government." He asserts that half of the 3,000 Rural Guards are in sympathy with him, and that the whole island is a powder mine to which a fuse "already half burned" is attached. Supporters of President Palma say that these declarations insure the defeat of Gomez at the presidential election.

Venezuela Final judgment in the suit of the Venezuelan Government against the French Cable Company has been announced by the Court of Cassation, which confirms the decision of March last. That was the decision of the presiding judge; he is now sustained by the entire court, which dissolves the Government's contract with the company, upon the ground that the latter has failed to observe the conditions agreed to, with respect to the construction of a ocean cable to the United States and of a national coastwise line. On July 19, two weeks before this decision was made known, the Government sued this cable company for damages, alleging that the corporation and its agents had assisted the revolutionists who were led by General Matos. According to reports from Caracas, the charges presented by Attorney-General Parejo are that Matos established relations with the company by conferences with its officers in Paris; that the company's representative in Venezuela, M. Jallabert, was thereafter instructed to assist him; that the station operators were placed under the orders of M. Quevrioux, an agent of the revolutionists; that they gave to Matos news of the Government's military operations and disclosed to various persons the Government's official messages. M. Jallabert is dead. The Attorney-General offers in evidence letters of instruction said to have been sent to him by his su-

perior officers in Paris, directing him to assist Matos so far as he could, and asserting that Matos had the support of the French Foreign Office. The authenticity of these papers is denied by the company, which cites the circular forwarded at the time to all its employees in Venezuela, directing them to observe the strictest neutrality.

The Meeting of the Envoys

The reception of the Peace Envoys by being made so largely a naval affair became an imposing spectacle, and the many nice points of precedence and international etiquette, which might have caused embarrassment, were brushed aside by the hearty informality of President Roosevelt. Count Sergius Witte, the second of the Russian envoys, arrived on the steamer "Kaiser Wilhelm der Grosse" of the North German Lloyd line on the afternoon of August 2d. He was preceded by a wireless report of an interview alleged to have been given on the boat in which he said that he expected that the Japanese terms would be so intolerable that the conference would break up in a week. This he disavowed, and gave to the crowd of reporters who boarded the steamer the following statement:

"I need hardly point out that it is my ardent desire that the two chivalrous foes who first became acquainted on the field of battle may have found in each other's sterling qualities motives powerful enough to cultivate that acquaintanceship until it ripen into lasting friendship. Meanwhile, however, the terms offered must first be ascertained, weighed and judged admissible by Russia before she can proceed to formal negotiations. Hitherto, as you are aware, it was customary in cases like this to settle all such preliminaries before the meeting of the plenipotentiaries, whose task it was to come to a final agreement upon matters under discussion.

"Now, the very fact that His Majesty the Czar consented to take a course involving a departure from this ancient diplomatic usage and to appoint a mission to learn the nature of our brave enemy's terms is an eloquent token of the friendly feelings which he and his subjects continue to cherish toward the people of the United States:

At the pier he was met by his colleague, Baron Rosen, and a delegation from the

Slavonic Society, who presented him with bread and salt as the symbols of hospitality. With Mr. Witte came eight military, legal and financial advisers, among them Prof. Frederick Martens, one of the most eminent authorities of the world on international law, and Major-General Yermaloff, who was with the American army in Cuba. Upon the same steamer there arrived representatives of the most important European journals, including Sir Donald McKenzie Wallace, author of one of the best books on Russia in the English language, as correspondent of the London *Times*, and Dr. Dillon, of the London *Telegraph*. On August 4th the Russian envoys attended morning service at the St. Nicholas Russian Orthodox Cathedral in New York, as it was the name day of the Empress Dowager Maria Feodorovna, and in the afternoon they went by rail to Oyster Bay to lunch with the President, as the Japanese envoys had done the week before. On Saturday the formal meeting of the envoys took place on the President's yacht "Mayflower." The Japanese delegation, Baron Komura, Minister Takahira and a suite of 12, were the first to arrive at Oyster Bay, on the cruiser "Tacoma," and were received in the cabin of the "Mayflower" by President Roosevelt. Half an hour later the cruiser "Chattanooga" brought the Russian plenipotentiaries, Baron Rosen and Count Witte. The Russian and Japanese flags were each greeted with a salute of 19 guns; the President's with 21. After the introductions an informal luncheon was served by Chinese waiters, during which the President offered the only toast in the following words:

"Gentlemen, I propose a toast to which there will be no answer and which I ask you to drink in silence, standing. I drink to the welfare and prosperity of the sovereigns and the peoples of the two great nations whose representatives have met one another on this ship. It is my most earnest hope and prayer, in the interest not only of these two great Powers, but of all civilized mankind, that a just and lasting peace may speedily be concluded between them."

After the reception the President left the "Mayflower," which was given over to the Russians and, with the "Dolphin"

carrying the Japanese, proceeded to Portsmouth, under the escort of the cruiser "Galveston," much delayed by fog in the Sound. Mr. Witte, being a poor sailor, landed at Newport and went by rail to Boston.

Pauperism in England There seems to be no longer room to doubt that the condition of the poorer classes in England is continually growing worse. The reports of the medical examiners of recruits for the army showed such evidence of physical degeneracy as to cause general alarm, which was only partially allayed by the investigation of a Parliamentary Commission, which found the conditions exaggerated, altho serious enough to demand attention. The Commission reported that one of the chief causes of physical deterioration is that many of the children do not get enough to eat. The Education Committee appointed by the London County Council to investigate the subject found that many children do come to school underfed and more of them ill-fed, and that it was impossible to secure the best results in education from either underfed or ill-fed children. The Committee, however, does not consider it practicable to provide meals for them at the public expense, even if, as was suggested, the cost of the meals be charged against such of the parents as are able to pay. It is recommended that at a few schools the experiment be tried of supplying one meal at cost, some three or four cents, utilizing the cooking classes as far as possible in preparing it. The latest statistics show that there is now more pauperism in England than at any time since 1873, and that it has increased rapidly in the last few years. The total now recorded is 768,390, or 22.8 per 1,000 of the population. The increase over last year is 30,756, and it is higher by 63,782 than it was ten years ago. The number of indoor poor in May was 238,934, as against 229,915 in May, 1904, and 189,903 ten years ago. The present total is without parallel in the record of Poor Law statistics. The growth of the workhouse population has been rapid during the present century, the rise being 45,610, while the ratio of such paupers per 1,000

of the population has gone up from 6 to 7.1, a ratio which has never been exceeded in any past year. Of outdoor paupers there were in May, 529,456, as against 507,719 in May, 1904. The ratio of outdoor paupers per 1,000 of the population has gone up from 14.9 to 15.7 in the present century, tho it was higher ten years ago—namely, 16.9. The number of paupers in London (included in the total for England and Wales) in May last was 117,587. This is an increase of 7,918 over the total for May, 1904; it is 20,087 more than in 1900, and it is higher than in any previous year since 1871, when it stood at 126,728. The ratio of paupers per 1,000 of the population in May was 25.3, in 1904 it was 23.8, in 1900 it was 21.7, ten years ago it was 22.4, in 1878 it was 22.1, and in 1865 it was 31.6. There were 73,255 indoor poor, as against 70,907 in May, 1904, and there has never before been a larger number of paupers in the workhouses, while the ratio per 1,000 of the population—15.8—has not been greater in any past year. In 1865 it was 9.6, twenty years ago it was 13.3, ten years ago it was 14.1 and last year it was 15.4.

Politics and Poverty in Spain

The new Liberal Cabinet under Señor Montero Rios has already in its first month encountered serious difficulties, and is not likely to have a much longer life than the Conservative Cabinets that have preceded it. The famine in Andalusia resulting from the failure of crops required immediate relief, and the Secretary of Agriculture, Señor Romanones, asked for an emergency appropriation of \$2,400,000 to be expended as seemed best in aid of the famine sufferers and in public works to relieve the industrial crisis. In strict legality there was no way of granting this because the Cortes failed to vote the budget, or, as we would say, to pass the appropriation bills, for 1905, before they were prorogued last December, and had made no provision for 1906 when the Villaverde Cabinet fell in June. The constitution provides that in the event of a failure of the Cortes to vote the Budget in any one year the last Budget voted will hold for a second year. But whether it will hold for a third year

is questionable. Señor Rios favored making any necessary expenditures, including the relief appropriation, and trusting to the Cortes to be elected next month to justify it. But the Minister of Finance, Señor Urzaiz, who is regarded as the most able man in the Cabinet next to the Premier, resigned rather than sanction it. Señor Echegaray, chemist, mathematician, poet and dramatist, was appointed in his place. He is 73 years old, one year older than Premier Rios. He served as Minister of Finance in 1873, but of late years has devoted himself to literature, for which he received last year the Nobel Prize. The former Premier, Señor Villaverde, died July 16th. He will be chiefly remembered for his effective work in restoring the credit of Spain by retrenchment and reform after the war with the United States. The heir to the Spanish throne, the Infante Fernando, died last week at the age of 10 months. He was a son of late Princess of the Asturias and a nephew of the King's. The octroi or municipal tariff adopted by the municipality of Salamanca caused serious riots. A large crowd assembled in front of the city hall threatening death to the councilmen and finally attacked them in the building. One of the councilmen jumped from a window in the attempt to escape and was nearly killed. At Seville 400 farm laborers invaded the city and rifled the bakeries. The young King slipped away from his attendants a short time ago in his automobile and was found praying in the grotto at Lourdes among the pilgrims who came there to be healed by the miraculous waters.

The Czar on Peace and Reform

On the eve of the peace negotiations the Czar has taken occasion twice in answer to addresses to emphasize his determination not to conclude peace on any but honorable terms. He would continue the war until the enemy was crushed rather than consent to the payment of an indemnity or the cession of territory. If this is not intended as a bluff it indicates that efforts of the military and aristocratic classes to arouse the war spirit have not been in vain. The Russian officers in Manchuria have sent repeated tele-

grams begging for a continuance of the war. General Linevitch denies that his army is surrounded or seriously threatened, and states that all the attempts of the Japanese to approach his flanks have failed, adding "The morale of the troops inspires me with complete confidence that the army is ready for any task."—The plan of Minister Buligin for a national assembly is still being discussed in the presence of the Czar at the Peterhof Palace. Count Lamsdorf, Minister of Foreign Affairs, and Mr. Pobiedonostseff, the Procurator-General of the Holy Synod, oppose all such concessions. The Grand Dukes Michael, Vladimir and Alexis favor the plan. General Trepoff, the energetic chief of the police system of the empire, has spoken in favor of liberal provisions in the measure, and Count Ignatieff, who was considered a reactionary, emphatically declared that reforms were necessary if the Romanoff dynasty was to be saved.—Count Tolstoy holds that all political changes are useless, and that only by the abolition of all property in land, as Henry George said, can the people be saved.

The Awakening of China

There are many indications that China is at last thoroughly aroused to the necessity of opening the country to foreign influences, and it seems probable that the same tactics will be adopted as have proved so successful in the case of Japan—that is, the reorganization of the country is to be done by the Chinese themselves, especially by those who are to be educated abroad for this purpose. In this regeneration of the Middle Kingdom it is evident Japanese influences will predominate. Last year there were 1,753 Chinese students studying in Japan. This year the number has increased to 2,641 and more are arriving by the hundred in every steamer. All of the 19 provinces of the Chinese Empire are represented among them except the remote province of Kansu on the Tibetan frontier. More than half of the students come from the valley of the Yang-tze River, opened to civilization through the treaty port of Shanghai. Some of them are sent at the expense of the Govern-

ment and others pay their own way. In many cases the local authorities have spontaneously furnished aid to send promising students abroad to continue their studies. Most of the students are young men between the ages of 20 and 30; none is younger than 12, but some are much older. One is 60 and another 64. They are distributed among the different educational institutions of all grades, many of them being in the law schools and the military and naval academies. The two students first sent over by the Chinese Government in 1897 are now completing their studies in the Engineering College of the Imperial University. An imperial edict has ordered four missions to be sent abroad to visit all countries and study foreign methods. These missions are headed by Tsai Tche, a prince of royal blood; by Tai Hung Chie, second Minister of Finance; by Chu Shie Chang, chief assistant of Yuan Shih Kai, the most progressive Viceroy in China, and by Tuan Fang, Governor of the Hunan Province. The plans proposed by Yuan Shih Kai, Viceroy of the Chili Province, for the reform of the administration, the establishment of schools and the adoption of a constitutional Government are reported to have met with the approval of the throne. There is a determined effort to boycott not only American goods but all foreign capital. The Chinese merchants in many parts of the empire have petitioned the Board of Foreign Affairs not to grant any more railway franchises to foreigners, claiming that they are able to finance the roads without outside aid. The native merchants of the Che-Kiang Province to the number of 160 have subscribed enough money to build the Su-Chau, Hang-Chau and Ning-Po Railroad and have asked the Government to cancel the concession to the English. Similar action has been taken in regard to the Canton-Hankau Railway, 800 miles long and capitalized at \$29,000,000, in which Mr. J. P. Morgan and King Leopold of Belgium are interested. The Chinese Minister at Washington is reported to have offered the American syndicate \$6,000,000 to turn over the concession to the Chinese. The French Government is seeking to obtain this concession.

Personal Recollections of Anton Pavlovitch Chekhov

BY MAXIM GORKY

[As a narrative of the visit of the best known of Russian short story writers to another regarded as still greater, the following article has an especial interest. Maxim Gorky has long been popular in this country, and his imprisonment on the charge of conspiracy to overthrow the Government has recently brought him into greater prominence. Chekhov's stories are now beginning to be translated into English, and since they are much wider in scope and more varied in style than Gorky's they are likely to find more readers among us. According to Tolstoy Chekhov is the founder of a new school of literature, and his influence will be lastingly felt throughout the world. He was born in 1860, the son of a serf who had freed himself by his own ability. He was educated as a physician in the University of Moscow, and began to write for college journals at the age of nineteen. His death last year is deeply regretted, since he was at the height of his powers of production and his stories were becoming somewhat more optimistic in tone. The illustrations accompanying this article are all taken from caricatures originally published in Russian newspapers and magazines. The translation is by Lizzie B. Gorin.—EDITOR.]

I BELIEVE that every man when in the presence of Anton Pavlovitch felt the desire of being simpler, truer, more like his natural self, and I observed many times how people threw off the gaudy attire of bookish phrases and all the other cheap finery of high-sounding, bombastic words in which our Russian loves to adorn himself, like the savage in his fish-teeth and shells and feathers, in the foolish desire of aping the Europeans. Anton Pavlovitch heartily disliked fish-teeth and cocks' feathers. In fact, everything striking, gaudy and foreign donned by some one to "give himself additional importance" irritated and threw him into confusion. And I have noticed that every time he met an overdressed, bombastic person he felt inclined to free him from his burdensome and unnecessary tinsel trap-

pings, which distorted the natural face and living soul of his interlocutor. All his life Anton Pavlovitch lived on the wealth of his soul; he was always his natural self and kept himself internally free, not taking into consideration what others may have expected of him or others of less delicacy demanded for a moment. He disliked conversations on "high" themes—the sort of conversations with which our dear Russian generally loves to amuse himself, forgetting that it is ridiculous to speak of costly clothing which we are to have in the future when at present we are lacking even a decent pair of trousers.

Himself beautiful and simple, he loved simplicity, reality and sincerity, and he had a special way of making those with whom he came in contact simpler and better.

Gorky, the Contemporary Novelist

Gorky Has Been Photographed in So Many Poses that There Remains for Him no Other Pose but that of a Ballet Dancer

I remember that once he was visited by three richly dressed ladies. After filling his rooms with the rustle of their silk skirts and strong perfumery, they decorously seated themselves opposite their host, feigning that they were very much interested in politics, and began to "put questions."

"Anton Pavlovitch, with what do you suppose this war will end?"

Anton Pavlovitch coughed slightly and, after thinking for a moment, replied in his serious, gentle voice:

"In all probability—in peace."

"Well, yes—of course! But who will win? The Greeks or the Turks?"

"It seems to me that the one who is stronger is sure to win."

"And who, in your opinion, is the stronger?" the ladies asked, vying with each other.

"Those who are more intelligent and better fed."

"Oh, how witty!" exclaimed one lady.

"And whom do you like more, Anton Pavlovitch, the Greeks or the Turks?"

Anton Pavlovitch looked at her and replied with a kind, gentle smile:

"I like marmalade—don't you?"

"Very!" she exclaimed vivaciously.

"Of apricots!" sedately corroborated another.

And the third added with great relish, half closing her eyes: "It has a delicious aroma!"

And all three began to speak with great animation of marmalade, thereby showing that on this particular question they possessed a splendid erudition and a thorough knowledge of the subject. It was evident that they were glad of the opportunity not to strain their minds in feigning an interest in either Greek or Turk, neither of whom they had ever thought of until the very moment.

On leaving Anton Pavlovitch they said merrily:

"We shall send you some nice marmalade!"

"You have had a nice conversation!" I remarked after they had left.

"It is necessary that every one should speak his own language," he laughingly said.

On another occasion I found with him a young and very handsome assistant district attorney. He was standing before Chekhov and speaking in a very animated way, shaking his curly head:

"In your story, 'The Malefactor,' you have brought before us a very intricate question. If I should acknowledge in Denise Grigorieff an objective vicious will, conscious of the crime he commits, I would feel compelled to put him into jail without the least scruple, because that is what the interests of society demand. But he is a savage; he had committed the crime unconsciously, and I feel sorry for him! But if I should deal with him as with a creature who acted without understanding and therefore treat him with clemency, what guarantee can I give to society, whose interests I am bound to defend, that this Denise will not again meddle with the rails and thereby cause a terrible disaster? This is the question! What, therefore, is to be done?"

He stopped, threw back his shoulders and stared scrutinizingly into the face of Anton Pavlovitch. He was dressed in a brand new uniform and his breast buttons shone as self-consciously and stupidly as the eyes in the neat little face of the youthful zealot of justice.

"If I were the judge," Anton Pavlovitch replied earnestly, "I would acquit Denise."

"But on what ground?"

"I would simply say to him: 'See here, Denise, you have not yet ripened

into the type of a conscious criminal; go and ripen!"

The jurist laughed, but immediately continued with his former pompous earnestness:

"No, my revered Anton Pavlovitch. The question you put forth in your story can only be decided in the interest of society, whose life and property I am called upon to defend. Denise is a savage, yes, but at the same time he is also a criminal—this is the truth!"

"How do you like the gramophone?" Chekhov suddenly asked, very kindly.

"Oh, very much indeed! It is a wonderful invention," the youth replied vivaciously.

"And I cannot bear it!" Anton Pavlovitch sadly confessed.

"Why?"

"Because it sings and speaks without feeling anything, and it all comes out like a caricature—dead. Are you interested in photography?"

It came out that he was a passionate admirer of the photographers' art and he immediately began to speak of it with great enthusiasm, entirely forgetting the gramophone, tho he had so much in common with that "wonderful invention," as Chekhov so cleverly and truly observed. And once more I saw peeping from out the uniform a funny little man who as yet felt himself as much at home in the position he occupied in life as a young pup feels at the chase.

After escorting his guest to the door Anton Pavlovitch said gloomily:

"And such a pimple on the face of justice is deciding people's destinies!"

And after a moment's silence he added: "It seems to me that district attorneys love to angle fish."

He possessed the art of detecting and bringing out triviality—an art attainable only to men of very high demands upon life, and which is created only through a passionate desire that people should be simple and beautifully harmonious. Triviality always found in him a keen and cruel judge.

Some one said in his presence that a certain publisher of a popular magazine, a man who always talked of the necessity of love and mercy toward others, had without any reason insulted a con-

ductor of a railroad and generally treated his subordinates very badly.

"Well! Is that anything surprising?" said Anton Pavlovitch, frowning and smiling at the same moment. "Is he not an aristocrat—an educated person? Did he not attend the seminary? Has not his father worn bast-shoes and does he not wear patent leather boots?"

And in the tone in which he pronounced these words was something which at once made the "aristocrat" appear both insignificant and ridiculous.

"A very talented man!" he once said, speaking of a certain journalist. "He writes so nobly, always, and compassionately—sweetly—sweetly—calls his wife in the presence of strangers a fool—keeps his servants in a damp room and complains that the chambermaid suffers with rheumatism."

"Do you like N. N., Anton Pavlovitch?"

"Yes, very much. A pleasant man," Chekhov agreed, coughing. "He knows everything—reads much; he swallowed three books of mine. He is very absent-minded. To-day he tells you that you are a splendid fellow, and the very next day he will inform some one that you are cheating your servants out of their wages, and that you have stolen the silk socks from the husband of your mistress—black ones with blue stripes."

Some one complained in his presence of the tediousness and heaviness of the "serious" sections of the larger magazines.

"Do not read the articles," Anton Pavlovitch persuasively advised. "They are the so-called friendly literature—a literature between comrades. The authors of these articles are Messrs. Krasnov (red), Bielov (white), and Chernov (black). One writes an article, the other

Gorky and Chekhov as Rivals for Public Favor

objects to it, and the third reconciles the contradictions of both. It looks very much like a game of whist, a dummy for the fourth partner in the game. And not one of the three of them ever asked himself the simple question, why the reader needs all this.

"Critics are very similar to the gad-flies which are always hindering the horse in his work," he used to say with the clever smile of his. "The horse plows and strains its every muscle like the strings on a counter-bass; suddenly the gad-fly descends upon his back and begins to tickle him and to buzz, and the poor horse frets and waves his tail. What does the gad-fly buzz about? It hardly knows itself. It simply possesses a restless nature and wants to introduce itself to every one's notice—'know ye that I also am a resident of this globe! As you can well hear, I can even buzz—I can buzz about everything!' For the last twenty-five years I have been diligently reading what the critics had to say about my stories and I cannot remember to have found one useful indication or one good advice in all these years. Only once Skabichevsky made an impression on me when he wrote that I would 'die in a drunken state, somewhere under a hedge.'"

There always lurked in his gray, sad eyes a fine, ironical smile, but at times they could become cold, sharp and hard; at such times his flexible, soulful voice sounded harder, and it seemed to me at such moments that this modest, delicate man would stand up for his rights and defend them against an evilly disposed power, if he should find it necessary, with vigor and strength, to the very last breath.

When it was rumored that Gorky was planning to write a play on the life of the Jews the Tramps said to him: "O, for Whom Have You Left Us?"

At times it seemed to me that there was in his relation to people a feeling of utter hopelessness, something akin to a cold, quiet despair.

"A Russian is a remarkable being!" he once said to me. "He is very much like a sieve; everything goes through him. In his youth he greedily fills his soul with everything he can lay his hands on and at the age of thirty all that remains of it is a kind of grayish rubbish. To live well, worthy of a human being, one must labor. Work lovingly, faithfully—and with us nobody is able to do this. An architect sits down to the card-table or spends his time in the wings of the theaters as soon as he has succeeded in constructing two or three decent buildings. A doctor as quick as he succeeds in building up a lucrative practice for himself loses all interest in science and never reads anything aside from the 'News in Therapeutics.' And at forty he is earnestly convinced that all diseases emanate from chills. I have never yet met an official who to some extent understood the importance of his work. He generally sits at the capital or Government-city and composes papers which are sent to Zmiev or Smargon for execution. But he thinks as little of those whom his papers at Zmiev or Smargon deprive of their freedom as an atheist thinks of the agonies of purgatory. A lawyer, after he once makes a name for himself in a successfully conducted law suit, does not trouble himself any longer with defending just cases; he takes up the defense of rich corporations, plays on the races, eats oysters and represents himself as a connoisseur of fine arts. An actor, after rendering a few decent rôles, gives up studying any further, dons a cylinder hat and proclaims himself a genius. Russia as a whole is a land of greedy, indolent people, who eat much and daintily, drink, love to sleep in the daytime and snore while so occupied. They marry because a wife keeps the house in order, and keep a mistress because it elevates them in the eyes of society. Their psychology is purely canine; if you beat them they hide in their kennels, yelping softly. If you caress them they lie upon their backs with raised paws and a wagging tail."

His words sounded cold and con-

temptuous, fraught with a deep sadness. Despising, he also pitied, and if I happened to rail at some one in his presence Anton Pavlovitch would immediately take up his defense.

"Don't! Why should you? And he an old man; he is almost seventy."

Or:

"He is still so young—it is only because of his foolishness."

And when he spoke in this way I did not see any aversion in his face.

In youth triviality seems only ludicrous and insignificant, but it slowly envelops its victim in its grayish mist, penetrates his brain, pollutes his blood like a poison or the fumes of charcoal, and the man soon becomes like an old sign-board eaten through and through with rust; it looks as if something was painted upon it once upon a time, but now it is impossible to distinguish what it was.

Anton Pavlovitch Chekhov had already shown in his very first stories that he was able to discover in the murky sea of triviality its tragically somber jokes; one has only to read carefully his "humoristic" stories to be convinced how much cruelty and depravity the author saw and hid with modest shame under the exterior of droll and comical situations.

He was modestly chaste and could not permit himself to say to people loudly and frankly, "Do be more decent!" vainly hoping that they might themselves perceive the necessity of it. Hating everything trivial and dirty, he depicted the abominations of life in the noble and lofty language of a poet and with the gentle, ironical smile of the humorist. And under the beautiful exterior of his stories is hardly noticeable the full bitterness of the reproach conveyed by them.

Reading, the daughter of the respected public laughs heartily, hardly noticing the disgusting derision of the overfed "Barin" toward a poor, forlorn creature, alone in a foreign land, among strange people and surroundings. And in almost every one of Chekhov's humorous stories I hear the same low, deep sigh of a pure, truly human heart, a hopeless sigh of compassion toward people who cannot respect their human dignity and resistlessly obey a brutal power,

When Gorky Bought a New Estate and Took Possession of it the Tramp Says, "O, Gorky, Wo is Me!"

living like slaves and believing in nothing, aside from the necessity of gulping down every day as much as possible of the fat cabbage-soup, and who feel nothing beside the fear of some one strong and impudent who may fall upon them and give them a sound beating.

No one understood as keenly and clearly as did Chekhov the tragedy of a petty life, and no one before him so mercilessly and truly depicted to the people the picture of the sad and shameless life they lead in their murky, monotonous, everyday existence.

His greatest enemy was triviality; he wrestled with it all his life, he laughed at it and wrote about it with an unimpassioned, sharp pen. He could find the moldiness of triviality, even where everything seemed on the first glance to be very well arranged, with comfort and even with certain splendor—and triviality revenged itself upon its worst enemy by playing on the dead a disgustingly vulgar prank by placing his body—the body of a poet—in a car "For the transportation of fresh oysters."

That dirty green car seems to me nothing less than the great triumphant grin of triviality over its worn-out enemy, and in the countless "recollections" of the daily press I perceive the hypocritical sorrowfulness beyond which I feel the cold, evil-smelling breath of that same triviality, secretly rejoicing in the early death of its enemy.

Reading the stories of Anton Pavlovitch Chekhov one feels as on a sad day in late fall, when the air is so transparent and the bare trees, narrow houses and gray looking people are so sharply

outlined in it. Everything seems so strange and lonely, motionless and helpless. The deep blue distances are deserted and blend readily with the pale sky, breathing with melancholy cold upon the earth covered with frozen mud. The mind of the author, like the late fall sun, lights up with cruel clearness the broken roads, crooked streets, narrow, dirty houses in which pitiful little people are suffocating with *ennui* and indolence, filling their houses with a senseless, sleepy bustle.

Here is "The Little Soul" running uneasily here and there, a dear, gentle little woman who can love so much and so lavishly. She may be stricken in the face and she will not even dare to groan aloud, gentle slave. Side by side with her sadly stands Olga from "The Three Sisters." She also loves much, and patiently obeys all the caprices of the depraved and vulgar wife of her indolent brother; the lives of her sisters are ruined before her eyes and she weeps and cannot be of any help to anybody. She has not even one vigorous word of protest in her heart against all these iniquities.

Here is the tearful Ranevskaja and the other former owners of the "Cherry Grove"—egotistical like children and decrepit like old people. They have missed dying at the right time and are whining, not able to comprehend what is happening around them—parasites, without any power of finding a new support for themselves which would keep them alive with its live blood. The insignificant student Trofimov, who can

speak so nicely on the necessity of labor, idles away his time, seeking a cure for his *ennui* in his foolish derision of Varia, who works her fingers to the bone for the benefit of an indolent crew.

Vershinin dreams of the beautiful life people will lead in three hundred years, without seeing that all around him everything is going to ruin; that under his very eyes Solenoy is ready, from sheer foolishness and out of *ennui*, to kill the pitiful Baron Tuzendbach.

Before the eyes of the reader pass an endless file of slaves of love, of foolishness and indolence, of greed of good things of the earth—slaves of a dark fear of life. They walk with a vague fear and fill life with incoherent speeches of the future, feeling that in the present they are out of place.

At times among the grayish crowd a shout is heard; this means that Ivanov or Treplov at last understood what he ought to do and—died.

Many of them dream so beautifully of how nice life will be after two hundred years have passed, and no one even thinks of putting to himself the simple question: But who will make that life beautiful if we will spend all our time in idle dreams?

Past all this crowd of helpless people went a great, wise, attentive man; he looked upon all these tedious inhabitants of the land of his birth and said with a sad smile, in a gentle but reproachful tone, with a hopeless sadness in face and heart, in a beautiful, sincere voice:

"You live very badly, gentlemen! It is a shame to live so!"

ST. PETERSBURG, RUSSIA.

A Collar Starcher's Story

[The following truthful story of the strikers' side of the case was given to Rheta Childe Dorr by a Troy collar starcher especially for THE INDEPENDENT. The author fears to have her name used, lest she never could get employment in her trade again. This strike of the laundry girls is a very remarkable one. We understand that the history of the labor movement shows no other case where so many strikers have held out without breaks or internal dissensions for an equal length of time.—EDITOR.]

WHEN I left school at the age of sixteen to go to work there were very few opportunities open to young girls, for the time was nearly thirty years ago. Therefore I considered myself unusually lucky to have been born and brought up in Troy, N. Y., where the shirt and collar factories offered employment to women. I was lucky also in being a large, stout girl, for the work offered me when I applied was that of a collar starcher, and while this does not call for much muscle, it certainly requires endurance and a good constitution. In those days practically all the laundry work was done by hand. There were no ironing machines and very few washing machines. The starching was about all there was for a girl of sixteen. So a starcher I became and a starcher I am to this day, or rather, I was until the strike came in May.

I thoroughly enjoyed my first working years. The factory was not at all a bad place. I worked side by side with my friends, the girls I had gone to school with, met at church and at dances and picnics. The starching rooms were very hot and stuffy generally, like a Turkish bath, and the work was hard on the hands; but I didn't mind these discomforts. Looking back at it now I think we were very well off. There was nothing like the rush and hurry we live in now. We were not driven at such a furious pace, for, of course, there was not nearly the business done then that there is now.

The starching itself was a very different affair. The collars were two-ply, instead of the thick, unwieldy things men wear now, and there was no "lady work," as we say. Just men's collars, straight or folded back at the corners—two or three styles are all I remember. We were not obliged to dip those light collars. We simply rubbed in heavy

starch, using our hands and soft cloths. It was hot enough, but not the scalding work it is now.

The working hours were not too long—about eight hours a day. We went to work at nine o'clock, except in the busy season, when we were on hand at eight. The day passed quickly with the talk and sometimes a bit of a song to liven things up. We used to sing part-songs and old-fashioned choruses. Some of the girls had beautiful voices.

We have to be at the tables at seven now and an ambitious worker is usually in the factory half an hour before the whistle blows, to get her table ready. As for talk or singing, the foreman would have a fit if anything like that should happen. In our factory all talking is strictly forbidden. You run the risk of instant dismissal if you even speak to the girl across the table. Even at the noon hour you can only whisper. I've seen girls discharged for talking and I know of a case where a girl lost her job for sneezing. The foreman said she did it on purpose. They are not as hard as this in all the factories. Much depends on the foreman.

My father and mother died before I was twenty. We had our little home and my brother and my three sisters and I lived on there. Three of us girls worked in the factories and one sister stayed at home and kept house for us. Our combined wages made a pretty good income. We lived well, dressed well and were very happy. My brother married and went West to live. The housekeeping sister married next and then my youngest sister found a husband. That broke up the home, for the two that were left couldn't afford to keep it up. We took a couple of rooms and did our little housekeeping early in the morning before we went to work.

At this time there came a break in the

monotony of my life. I married a young man I had known for a number of years. He was an iron molder and made good wages. We went to housekeeping and I thought my collar starching days were over forever. But my husband was taken ill, and before I realized that he was seriously sick I was a widow with a two-year-old daughter to support.

I naturally thought of the factory, but a friend who kept a grocery store begged me to come to live with her and help her with the business. I was glad to do it on account of my little girl and I did my best to become a good grocery clerk. I cannot say that I enjoyed it, however. It was slow compared with the sociability of the factory, and besides, when you have learned to do one kind of work well you prefer to stick to your trade. I stayed at the store for eighteen months and at the end of that time I married again; a young telegraph operator I met in the store.

You see I have really done my best to fulfill what the ministers and others often tell us is the true destiny of a woman—to be a wife and mother. But the fates have been against me. My second husband had incipient consumption when I married him, altho neither of us knew it. He died after a short illness and six months later my little boy was born. Before the baby was a month old I was back in the factory, a starcher girl once more. Except for this interval of six years I have earned my living starching collars at four cents the dozen.

I have managed to bring up my two children fairly well. They have gone to school and my daughter has had music and dancing lessons. She is thirteen now and beginning to think of learning a trade. I shall not allow her to become a starcher. My boy is ten. He is very fond of his books and I shall try to put him through the high school. I don't know exactly how it is to be done, especially if the Employers' Association succeeds in cutting our wages in half.

There are many married women and widows in the factories in Troy. Of the married women, some have been deserted and others have gone to work because their husbands could not seem to make a living. It seems to me that in a community where the women greatly out-

number the men the men get discouraged and deteriorate. Very few of the girls in Troy look forward with enthusiasm to marriage. If they are making fairly good wages they hesitate before giving up their jobs. They have too many object lessons around them of women who have come back to the factories after a few years of married life, all their gayety and high spirits gone and two or three children at home to support. It is a mystery to me how they bring up their children so well. I had friends to help me with mine and I suppose the others have. It means sitting up until all hours sewing, mending and washing little clothes. After all, a working mother is like any other woman; she wants her children to wear pretty dresses and starched white petticoats.

Collar starching cannot be classed with unskilled labor. It requires considerable intelligence and a knack of handling the starch so as to get it smoothly through the goods. A poor starcher can upset a whole laundry, for if the collars come out soft from the ironing machines they have to be washed over again. The collars come to us in bunches of a dozen each. We cut the string, dip the collars in a tub of scalding hot starch, throw them on the table, which is covered with a clean cloth, and with the tips of our fingers rub out all the bubbles and wrinkles and force the starch evenly through the linen. Then with a soft cloth we wipe off the superfluous starch and pile the collars in dozens again. They are hung on long bars, which are thrust into drying ovens, after which they go to the sprinklers and ironers. This is mostly machine work, done by young girls. The finishing is hand work and is done by older women.

The starchers work very quickly, of course. They have to, both for the sake of the collars and for the sake of their wages. It is possible to starch fifty dozen or more a day, depending on the style of collar. I have often done so. The straight band collar is easier than the wide turnover. If the work kept up at such a pace a starcher's wages would amount to ten or twelve dollars a week, but, unfortunately, the busy season lasts only three months in the year. A good starcher makes as high as fifteen or six-

teen dollars a week during those three months. The rest of the year she is lucky if she makes seven dollars a week. The average, I think, is about six. The average wage the year round is between eight and nine dollars.

In order to make good money during the busy season I get up at half-past five in the morning, prepare a hasty breakfast, leaving the dishes for my daughter to wash. By half-past six I am at work. In the middle of the morning I stop just long enough to take a cup of coffee and a piece of bread, which stay me until lunch time. Ten minutes' pause for lunch and I am hard at work again. Sometimes I work as late as eight o'clock. When I get home my daughter has my dinner ready for me. A year or two ago I used to have to get it myself after the work was over. Then, often there was washing to be done, for I am obliged in my factory to wear a white gown. Dark calico doesn't present such an attractive appearance, you know.

Many women have it harder than I. One friend of mine has two children and a bedridden mother to care for after hours, and just before the strike her husband was brought home with a broken hip.

I am describing conditions in the nine factories which make up the Employers' Association. These factories supply nearly ninety per cent. of all the collars and cuffs sold in the United States. There are other factories in Troy, two of which make the highest grade collars sold. They have refused to join the Employers' Association. These factories pay better wages than the others and treat their employees well. Unfortunately they do not launder their own collars. Most of their work is done in a large independent laundry in the town. This laundry pays its starchers five cents a dozen for collars. Everybody likes to work there, for the girls are treated splendidly. They are allowed to talk and laugh as much as they please, provided they don't waste their time. In spite of the high wages and the good treatment of the girls that laundry makes money. It seems queer, doesn't it, when we are told that our employer's business would go to smash if we were allowed to speak to the girls across the table?

I have said that a girl in our factory could make between eight and nine dollars a week the year round. The books will show that this is true, but the fact is you can't find out all there is to factory work by looking at the books. You can't find out, for instance, how much of the employees' wages go back to the firm in the shape of fines. To be docked two dollars a week is the commonest thing in the world at our factory. We expect it, in fact, and are thankful when it amounts to no more.

When I go to work in the morning I am given a slip of paper marked on one side "Received" and on the other "Returned." I mark on the one side the number of collars I receive. When the collars are starched I turn them over to boys from sixteen to twenty and they are sent to the drying rods. These boys mark on the other side of the slip the number of collars returned. If a boy makes a miscount or if for any reason at all the numbers do not tally on both sides of the slip, the starcher is docked. The amount docked from her wages is purely arbitrary. If she is short a dozen of work she is charged from fifty cents to a dollar. If the return side contains a dozen more collars than the starcher appears to have received the starcher is docked ten cents and is not paid for the work she is credited with doing. The great majority of the girls are docked every week in this matter of the received and returned slip. The boys are never docked, it being assumed, apparently, that they never make mistakes. But we no longer even wonder why these unjust distinctions are made.

If a starcher drops one collar on the floor she is docked five dozen collars. In other words for every collar dropped on the floor the girl must starch five dozen collars for nothing. The starcher is even held responsible after the collars leave her hands. If the bars on which the collars are dried happen to be dirty the starcher is fined, although the bars are supposed to be cleaned by other workers. If a collar drops from the cleaning bars and is found on the floor, the four girls whose work is nearest are fined. Since it is not possible accurately to locate the careless one the four are punished in order to fine the right one.

These are not all the excuses for docking, but they are the most flagrant and unjust ones. It has been said on good authority that our firm alone has recovered from its employees, in fines, \$159,900, during the past ten years. I am not an expert at figures, but I should think that the amount was fully as large as that.

The starchers are no worse off in the matter of fines and hard regulations than the stitchers and banders and other women operatives. In some departments the pay is so low and the fines so excessive that the operatives hardly make a living wage. Yet, for some reason, the starchers alone have been organized. Our union has not been a very strong one and in the two recorded strikes in the last twenty years it suffered from the weakness and dishonesty of its leaders. Our position seemed pretty hopeless last August, just a year ago, when our present troubles began.

At that time several firms in the Association put in starching machines. We had no objection to machines, nor have we now, provided the machines do the work. We would welcome any device which made our task easier or enabled us to turn out more work. I want to make that point clear at the outset.

The machines were brought in but the table starchers were not put to work on them at once. Young girls were brought in from the outside and were set to work in a room by themselves. These girls until just before the strike were not subjected to the same conditions that the table starchers were under. They were given only the easiest work; they were allowed helpers, so that they never had to leave their tables. They were not docked for any cause. In this way they were able to make very fair wages, the payroll, in fact, showing that they received about the same as the table starchers, who were receiving larger pay per dozen collars. Then the table starchers were informed that hereafter all starching would be done by machinery and that wages would be cut to two cents a dozen. At the same time they began to lay off ten girls a week.

The great majority of the girls were entirely ignorant of labor union methods. Most of us had never even read any la-

bor literature. But every one of us realized that the time had come when we must organize. The first thing the union did was to agree, instead of having these girls laid off, to share our work with them. We were anxious to retain the girls for more reasons than one. For instance, we were puzzled to understand why they were laid off. We knew that there was no shortage of work, for the firms were actually sending work out to other shops.

We next agreed to try the machines, and we maintain that we did give them a fair trial. They were put in some time in August, and the strike did not come until the 4th of May following. We experimented with them long enough to convince all the starchers, including the new ones who had never starched after the tables, that the machines did not and could not starch the collars. The starchers were supposed to only have to rub the work over lightly after it left the machines, but the fact is they had to do as much to the collars after they came out of the machine as they did to the hand starched work. The machine work resulted in stiff welts in the loose linings of the collars, and these welts we had to beat and soak out, and often restarch the whole collar, making the process longer and harder than it had ever been, with a cut of fifty per cent. in our wages.

Why should the firms have put in such machines? We asked ourselves the question, and at first it seemed like another of the experiments they try from time to time, experiments which the workers are made to pay for. One such experiment was the use of a certain kind of starch, presumably a cheaper quality than had been used, for the end and aim of all manufacturers is, of course, to lower the cost of production. I shall never forget that starch. It was a German importation. We tried very hard to use it, knowing, of course, that we would be docked if the work was unsatisfactory. It was impossible for us to get it into the linen, and our work all came out soft. We were docked, tried the starch again and were again docked. Then we struck, but our union was too weak to hold out. We went back, tried the starch three days more with the same result and finally convinced the firm that

the starch was no good. We paid for that experiment with something like a week's wages.

Knowing the uselessness of combating an experiment we kept on at the machines for a little while after we saw that they could not do the work. The factory was all upside down. One day one thing would be said and the next day another. Three cents a dozen for hand work began to be talked about, and then, all of a sudden, the light broke upon us. The whole thing was clear. The machines were merely a subterfuge to reduce wages. It is not easy to reduce a wage scale which has obtained for twenty-nine years. Awkward explanations have to be made and there is always trouble. The longest way around is the shortest way home in such matters. To put the burden of the reduction on the worker is a clever trick. To bring the thing around in the shape of a compromise is to save a great deal of trouble.

This sort of thing could not go on indefinitely and finally the end came. The table starchers and the machine starchers held a meeting and discussed the situation. We agreed that we could not stand a reduction of fifty per cent. We felt that we should have to grant something to save ourselves, so we agreed to accept a reduction of twenty-five per cent. by working after the machines, with bunchers and hangers up, but we were firm in our determination to stand by our old wages for table work. Meanwhile small groups of girls were being discharged and laid off.

We appointed a committee to call on the head of the firm. He refused to let the committee into his office. Twice was the committee refused an interview. Then we struck. The girls remained in the workrooms until one of the firm came in. He said that he had business at the armory and could not talk to them. The leader asked when he would be willing to discuss matters. He said: "You must first go back to work, and I will consider about giving you a hearing at some future date."

The girls refused to go back to work until the matter of discharging and the matter of wages were discussed, and that night they were all discharged.

Several attempts were made to patch

up the trouble. The Commissioner of Labor tried to intervene and the State Board of Mediation, I think it is called, did what it could. The Chamber of Commerce also tried. Arbitration was all the girls asked for, but they insisted that the arbitration come before they went back to work. President Shea of the Federation of Labor and George Waldron, a delegate of the Federation, were chosen to confer with our firm. The firm referred them to the Manufacturers' Association. The Association refused to meet the men but agreed to meet a committee of the starchers. On May 11 the starchers met the Association, and two days later they met them again. Nothing came of either meeting, and a few days later all the girls walked out, not only from our factory, but from the nine in the Association. The machines had not been installed in all the factories, nor had the wages been reduced in all the factories, although we knew that they would be, since the Association exists to kill competition between the factories. The immediate cause of the sympathetic strike was the action of the other factories in taking the laundry work of the factory where the strike occurred. We have been much blamed for this sympathetic strike. As for me, I cannot see the difference between our sympathetic strike and the sympathetic action of the factories in the Association.

We have been out ever since. At first there were small riots. We picketed the factories and tried by all peaceable means to prevent the non-union girls hired to take our places from entering. Some of them turned back ashamed, but others persisted in going in. These girls had their hair pulled and their faces slapped. I am not concealing that. The non-union girls were certainly terrorized. A few of them were handled pretty roughly. We have been denounced for this. Well, there may be better methods of preventing thoughtless and heartless girls from injuring their class, and thereby injuring themselves. There may be, I say, better methods. I wish I knew what they were. Many of these girls were not in the permanent working class. They became strike breakers from ignorance and want of re-

flection, most of them. Others probably belonged to the class that out of pure snobbery opposes organization. They will not join a union because they do not wish to officially ally themselves with the working classes. There are plenty of women like that. As I said, I wish I knew some way of teaching them their lesson without slapping their faces.

We have allied ourselves with the national body of the Laundry Workers' Union and receive strike benefits from them. Some of the girls, whose sisters are working, voluntarily do without the benefit money; so there is enough to support the others. Some have left Troy and have found work in other towns. The rest of us are still doing picket duty and are holding the union together in all ways we know of. We have every confidence in our leaders.

The sympathy we have met with in the town has been very encouraging. One merchant gave us \$500 cash and another gives us \$25 a week. Of course most of the merchants are afraid to offend the manufacturers, whose patronage is worth more than that of the workers. The churches generally are thoroughly down on the strikers and our own ministers tell us that we ought to submit our-

selves to the terms our kind employers are good enough to offer us. The head of my firm is one of the most generous contributors to the Y. M. C. A. and has helped build and renovate two churches. He is called an active Christian and is very much looked up to by the best people in Troy. Others in the Employers' Association are splendid churchmen. The Sunday schools and the church societies have a great hold on many of the stitchers and banders. For this reason large numbers of them hold out against a sympathetic strike of the operatives. They tell us privately that they hope we will win and if we do they will probably form unions of their own. That is always the way and we do not complain.

Meanwhile there is one comforting feature: the Employers' Association, in order to save money, is spending it. They have to send all their laundry work out of town to get it done. Some of it goes as far away as Chicago. Their express bills must be something awful.

There is one more little bit of comfort. You ought to see how fat and rosy the girls are getting in the open air. Girls who didn't look like anything are as pretty as pinks since they began to do picket duty.

TROY, N. Y.

Going Berrying

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," "OLD FARM DAYS," ETC.

I AM seventy-three years of age, but I am going berrying whenever I please. The boys have no right to all the genuine fun in the world. There is a deal too much treading on our heels. They may do it in the shop and the office; but the woods are still ours. We are "old," but not so old as the hills. The boys may claim the gardens also if they like, where the big berries grow under big names—sixteen to the quart. I like better the free and unclaimed glensides and the knolls on the hillsides, where strawberries creep at five hundred to the quart. Down on my knees, and my head full of boy joy and forgetfulness of sociological problems! It is delicious! And sometimes I run my arms through a fence, and grab a few nodding stalks in my neighbor's meadow. What did they nod for? A cuckoo gives the alarm, and my conscience gets sorely muddled with proverbial ethics. It surely is safer for me to face away from that fence.

I go home with a basket full of *Fragaria chiloensis* crossed with *Virginiana*, and try to imagine that they are sweeter than the Sharpless and the Senator Dunlap and the sample of my garden. Nonsense! they are not! It is the romance, the delicious abandon of moulting old age that gives the charm and even the fragrance. My appetite is just as good as at seven, and there is no use trying to fool myself—those berries are beautiful on their stems; and they do smell finely; but they are not superior in any single

way to our best garden sorts. City people, who are compelled to eat Wilsons and Crescents and Warfields—pickles in the strawberry line—may prefer these little, wild, mild, sweet berries; I do not. But the ramble, the freedom, the baby thoughts, the downright jolly time—these I hold to be better than anything that I can find where markets are to be considered.

Raspberrying is still more my delight, because we can find so many varieties. This berry is all upset. It is struggling for civilization; and some bushes have even lost their thorns. In color there are not only black ones and red ones, but white ones and yellow and pink. The black sorts are of all sizes and all shades of color. I find some of those in the clearings, crawling over stumps, that are superior in flavor to the best in the gardens. I have seen a bush climbing over a pile of stones; and a mass of clusters, glossy, and certainly equal in all ways to the Souhegan and the Kansas. Do you know that the birds are great horticulturists? Between them and the bees are solved some of the great problems of cross-breeding. The bees do the crossing and the birds carry the berries all about the fields. These spring up and the new crosses constantly increase. Man is left to do the selecting. The fact is, an alliance has grown up between us and the bees and birds, upon which civilization is almost entirely dependent.

Recently the black raspberries and the

red ones have taken to crossing, producing huge purple fruit. These crosses follow the black, rooting at the tip, but they are like the red in form and general flavor. They almost invariably, in their seedlings, revert to the black. Such crosses are not uncommon around the edges of the woods. A yellow black raspberry is also found—generally a very seedy affair, but sometimes luscious and high flavored. These have a bad habit of losing their color after having been picked for an hour or two. Such sports always occur where a variety or species gets upset, or broken, in its conservative routine. A red sort will give us a white seedling, or a yellow; or possibly a single branch will sport its color. The Golden Queen is said to be a New Jersey sport of the Cuthbert. The flavor sports also, and the texture. This crossing and sporting we take up scientifically; but Nature does it rather contrary to her will. She cares very little for fancy and huge things; she wants fecundity. When we argue her down with our "improvement" and "progress," she yields gracefully, and tries experiments in the forest edges and the wild glens. Go anywhere, with an eye to the new things, and you will find raspberries are amazingly unsettled. They look unhappy in each other's company. There are the aristocrats and the democrats; the old fashioned, conservative small ones, covered with thorns, and let alone by both man and birds, and the big progressives that quickly take our fancy. With radicals thorns are unpopular. Man has come about to take the place of thorns—the proud protector of the best. Selfish competition of all sorts is to be displaced by love—thorns in the berryfields and bayonets where the people meet must go.

The red raspberry has another tale to tell. It was not made red because Mrs. Brown likes that color for her jelly or in her rows of cans (by the way, every woman thinks more of the beauty of her canned berries than of their quality). They were and they are red, because in that way they easiest catch the eye of bird gardeners, and so the seeds are distributed all about the wilderness. Black is another color that, by contrast, catches the eyes of the bird and secures plenty of

distribution. The most curious garden imaginable is that which comes up where you cut away an evergreen tree. For years the birds have dined in its branches and dropped seeds. Visiting my Michigan garden, which I had left as a fine illustration of art and culture, I found it to be a marvelous thicket—and half the trees were what I never planted. They had come from seeds dropped by birds.

But all this while that I am talking to you I am filling my basket with some of the most beautiful and fragrant red raspberries that you ever saw. Just now there is a sub-conscious statement, somewhere about my physical nature, that the dinner hour has come. By the way, a wise man knows far more than he thinks he knows. He knows a great deal without thinking. Imagine yourself on a very high hill—or range of hills—half a mile from a house, and with an appetite like a north wind. A corn field is near by, with roasting ears. Logical sequences are, a fire of brush wood, a forked stick, and a half dozen roasted ears. If the owner of the corn happens along he will make no objections, provided you put out the fire carefully when you are through with your dinner. The proverb says "It takes a fool to kindle a fire." This is only partly true; a fool can kindle a fire, but generally he cannot put it out. It takes a bonfire sense to kindle a bonfire, and a stove sense to kindle a stove fire. The woodman's sense is not at all common sense; but is unique, and is an absolute essential to campers out. It puts out a fire so thoroughly that no possible harm can come from kindling it.

You do not know the wild gooseberry by the fuzzy things that you sometimes find absolutely hidden among thorns. You should go on a gooseberry hunt some day and see what you can find. Follow the fences for the most part—the old-fashioned zig-zag rail fences, or the stone fences, where the scythe does not easily get hold of the fringe of bushes. I have one fine scarlet berry that I found under such a fence nearly hidden by a huge elder bush; it is the only rich red gooseberry in cultivation. You may hunt all day, and get not one sort fit for cultivation; then again you will find a good many that are worth the testing. But you always have the consolation that

there is no jelly possible to be made better than that from the prickliest and meanest wild gooseberries. They are good for nothing else that I have ever heard of. The wild gooseberry, as you generally find it, with bushes literally covered with brier, and the berries themselves too prickly for the mouth, is the finest instance that I know of self-protection. Birds manage sometimes to pick holes in them, to extract the juice and seeds; but generally they hang until they drop with overripeness. I think it was working among such fruits that taught the oriole his bad habit of picking into our grapes and plums and cherries, to suck a bit without eating any whole fruits. In this way he has become the pest of vineyard and garden.

I do not know why it was, but it is a fortunate fact that the English people fell in love with the gooseberry; and this has led to a deal of improvement. Their Crown Bobs and Lancashire Lads are among the finest samples of plant breeding that we have. I am growing sorts that are three inches around. They are not so good for jelly as the wild ones; but for gooseberry jam and gooseberry tarts there can be nothing finer. To most people going gooseberrying is not as interesting as going strawberrying, but I have one boy friend who is a natural evolutionist. To find a bush worth transplanting pleases him more than a basket full of fruit. He either digs it outright and starts for home or marks it for future exploiting. He is a germinal Burbank. I think there are lots of these youngsters to be looked for as the influence of our experiment stations spreads.

Blackberrying is an art by itself. The essential incidentals are a good dog, a light basket and lots of lunch. You are to be gone all day, over the hills and through the gulches. You must wear an old discarded suit—too poor to give away to a respectable tramp. Your dog knows what you propose as soon as you pick up your basket and put on your rig. One inquiring sniff, and he leaps on you with a spatter of barks. A good lunch is something that can be easily carried and easily handled; cookies, bread and butter, only not too much, for you will fill up with berries. You will

find an hour before night when even dry bread without butter will be delicious. Cookies are ideal, as they can be carried in the pocket, and munched as you stroll—now a handful of berries and now a mouthful of cookies. Ginger snaps will not do, nor anything that contains abnormal irritants. The blackberry flavor is such a clean, pure flavor that it will not go with anything in the way of spice.

Berry lots are not as easy to find as they once were, yet somewhere within two or three miles of almost any home in the hilly sections there is a native glen—one untouched spot. This will almost surely have a brook running through the depth of it, and there will be many exceedingly interesting features beside the berries—piled rocks, tumbled trees, and great beds of ferns with scarlet lobelias. I have been this year through a glen whose sides were forever devoted to such things as blackberries, because too steep for horse and plow. We,—that is, my dog and I—sometimes crawled, and sometimes pulled our way where the bushes held great masses of luscious fruit. Rover had taught himself to relieve hunger by eating the berries. This he did skilfully by drawing up his lips and picking them with his teeth. In one of these tramps, even in the wildest places, you will find some attempts on the part of bush and berry to improve—but not as marked advance as with the raspberry. This impulse is getting to be universal. Man is hypnotizing the whole world. Everything is giving up its efforts merely to propagate by multiplicity and is learning to retain its hold on the soil by worth. Let the pessimists go out and study this tendency. Mr. Burbank's work is only a high stage of this effort of mind and will to control Nature and to bias natural laws.

Mem.—Got back at eight o'clock; had a big bowl of fresh milk containing half a pint of fully ripe and sweet blackberries and homemade bread. The bowl was replenished when necessary. This brought me into harmonious and almost spiritual relations between my stomach and my head. Ate it under the pine tree grove—then laid down in a hammock, fell asleep, and did not wake up till twelve o'clock. Went into the

house and to bed with a perfectly satisfied feeling. Shall go blackberrying as often as I please. Found that I had escaped six useless callers and a book agent—missed one friend. I have compunctions only about the book agent. Poor fellow! think of being detested by everybody. Next day had a great deep blackberry pie for dinner; and the dog came and laid his head on my knee, and looked as if to say, Won't you go again? What's the use of "business"? Let's go and have a good time! Animal instinct does not differ very much from human instinct; we all like to get away from the tape strings of civilization and lose our conventionalism in the woods. Is there really no way whereby the tens of thousands of city children can go berrying? How awfully far is the tenement wilderness removed from the wild glen and its delicious fruits—the crowd from the individualism of spending a day out of hearing of a single human being.

Perhaps these elements of the mass do not need, as yet, anything so serious as being dropped down alone in the woods; but we do. I am sure that I am revitalized and my mind clarified in no way better than by a days' companionship with Nature. At no other time do higher thoughts drop into the soul. I am in danger of losing God where they are all the time talking about him; but the personality that is in Nature, the infinite mind-power, nudges my elbows when I sit down with my dog on the hidden hillocks or dabble in the brook where fishes nibble at my fingers and crumbs. Ah, Life! Life! Beautiful Life! There is no escaping it, if one can but get the din out of his ears. Blessed be he that finds God. There is a power—a very simple human power—that is able to see him in bushes that do not burn and hear him in the ripple of the brook or the silence that surrounds the berry picker.

Yet there is a social side to berrying.

You should do your strawberrying alone; your raspberrying with a troop; your gooseberrying with one of like mind; your blackberrying with your dog. Nothing is more aggravating, when you find a strawberry knoll, than to have a half dozen tumbling over it, pell mell, to pull the stalks of berries. It is indelicate, spoils half the berries, and there is born a rivalry. At least at my age I like best to go deliberately, to study the beauty of the unplucked berries, to creep quietly about and hunt out the hidden ones, to carefully spare the unripe. Then what can be finer than to sit down, occasionally, on one of these knolls, to meditate on the charms of the far-spreading valley. Lie down, if you please, for a half hour's nap, on a mossy log—or on the hummock covered with delicious mints, while forget-me-nots grow at your feet. The bees are companions enough, with occasionally a song sparrow who leaps out of the bushes and trills gloriously. You have time to find his nest and count the eggs. Way off in the southeast you hear the roar of the iron furnaces. Who cares? Mother Nature has us on her lap to-day.

It is different with raspberrying. The fun comes in finding new crosses and studying everything by comparison. There is such a fine chance for competitive examinations. Besides, there are berries enough for all. My companions are nominally younger; but as they do not find it out it makes no difference. I never go on a gooseberry hunt except with Johnny, who has a genius for this sort of thing. He is better than a crowd. Yet in either case there is the afterstudy, the keen discussion of sorts and values and the later excursion to collect our plants. All this is for the good of the world. There will be years of garden testing to follow; and once in a while there will be a great acquisition.

CLINTON, N. Y.

The Recent Work of Professor Loeb

BY JOHN BRUCE MacCALLUM

[The remarkable discoveries of Professor Loeb in the debatable land between the physical and biological sciences have given rise to such exaggerated and sensational reports in newspapers and magazines, that it is with unusual pleasure that we give our readers an authoritative account of the problems he is now investigating from one of his colleagues in the University of California. Professor Jacques Loeb was born in Germany April 7, 1859, and studied physiology at Berlin, Munich, Strassburg, Würzburg and Naples. In 1892 he was called to the University of Chicago, where he spent ten years. His work on the physical and chemical explanation of some of the phenomena of life has been characterized as much by thorough and patient experimentation as by the originality and daring of his hypotheses.—EDITOR.]

THE experiments with which Professor Loeb has been engaged since the laboratory of physiology at Berkeley was opened have touched upon three main problems. These are the production of hybrids from two species not nearly related in the animal scale, the control of heliotropic reactions by chemical means, and the problem of artificial parthenogenesis, or the chemical fertilization of eggs in the absence of the male element.

I.—HYBRIDIZATION.

With regard to the first problem it has been well known that hybrids can only be formed from animals which are nearly related, and that in nature hybrid formation is very uncommon. Its rarity is emphasized when one thinks of the vast numbers of sexual products of various animals which become mature and set free in the sea water simultaneously. It must be an extremely rare event for the spermatozoon of one animal to fertilize the egg of another species under the natural conditions of life, since hybrids are never found in the ocean, except possibly those formed by very closely related varieties of animals. The problem therefore which presented itself to Professor Loeb was to determine, if possible, the conditions which prevent this fertilization, and to so modify either the egg, the spermatozoon or the surrounding medium that the crossing could take place between forms not nearly related. There exist obviously three variables—namely, the conditions of the egg, of the spermatozoon and of the sea water in which the animals live. It was hoped that by changing one or more of these variables conditions might be produced

in which the crossing could take place. It was finally found that by varying the constitution of the sea water the egg of the sea urchin (*Strongylocentrotus*) could be fertilized by the spermatozoa of the starfish (*Asterias*), two animals which are not at all related.

The eggs of the sea urchin were chosen for the experiment because their development can be accurately controlled. Many other eggs develop parthenogenetically—i. e., develop on slight chemical or mechanical stimulation without the aid of the spermatozoon. The eggs of the sea urchin, on the contrary, develop parthenogenetically only under certain conditions which are well known and can be definitely controlled. In addition to this the eggs of the sea urchin form a definite membrane about them as soon as a spermatozoon has entered. This is called the fertilization membrane and is not formed when the eggs develop parthenogenetically.

It was first shown by Dr. Loeb that normal sea water is neither acid nor alkaline in reaction, and that in this neutral medium the eggs of the sea urchin can be fertilized by the sperm of the sea urchin, but not by the sperm of the starfish. The same is true for artificial solutions which resemble sea water in containing sodium chloride and calcium chloride and in possessing a neutral reaction. If, however, the neutral sea water or solution be made slightly alkaline the hybridization between the sea urchin and the starfish readily takes place. It was found that the addition of a very small percentage of sodium hydroxide to the neutral solution caused 50 to 80 per cent. of the sea urchin eggs

to be fertilized by the spermatozoa of the starfish, so that they form the typical membrane of fertilization and begin to segment. It was further noted that in the alkaline medium in which sea urchin eggs may be fertilized by the sperm of the starfish the eggs of the sea urchin cannot be fertilized by the sperm of the sea urchin.

Two series of control experiments were carried on in this connection; in the first place to prove that the eggs were not contaminated by sperm of the same species, and in the second place to prove that the development did not take place as the result of artificial parthenogenesis. That there was no contamination by sperm of the same species was shown by the fact that eggs taken from the same sea urchin and left in sea water without the addition of starfish sperm did not develop at all. Artificial parthenogenesis was excluded by placing eggs in the alkaline solution in which hybridization occurred and adding no starfish sperm. Under these conditions no eggs segmented. It was also proven that the development was not the result of artificial parthenogenesis induced by shaking or other mechanical disturbance. Also the fertilization was not caused by some substance introduced with the sperm, for sperm which has been killed by raising the temperature did not produce the fertilization.

It is difficult to explain why sea urchin eggs may be fertilized by starfish sperm in alkaline sea water and not in normal sea water. It was shown by Dr. Loeb that it is not due to an increase in motility of the sperm in the alkaline medium. The sperm becomes still more actively motile when sodium bicarbonate is added, but no fertilization takes place in this mixture. It seems that the alkaline reaction is necessary only during the time that the sperm is entering the egg. The eggs may then be removed to normal sea water and will develop as well as in the alkaline mixture.

It is possible that these experiments may throw some light on the very obscure fields of immunity and infection. Why one animal, for example, is susceptible to the attacks of certain bacteria while another kind of animal is not cannot be readily explained. There may be

some analogy with the fact that the eggs of one species may be fertilized by a certain kind of spermatozoa while the eggs of another species may not. And if the immunity of the sea urchin eggs, for example, toward the infection by the sperm of the starfish depends on the absence of an alkaline reaction in the surrounding medium, it seems possible that the immunity possessed by the cells of certain animals toward certain bacteria may have a similar basis. No conclusion in this regard, however, can be made until more experimental evidence is gathered.

Since the addition of a small amount of sodium hydroxide to the surrounding medium not only destroys the immunity which sea urchins normally possess toward the sperm of the starfish, but also produces in the eggs an immunity toward the sperm of the sea urchin, it seems not impossible that an immunity against certain bacteria might be established in an animal by changing in some way the chemical nature of the medium which surrounds the cells of the body.

These relations to the problems of immunity are mentioned by Dr. Loeb not as facts or theories, but merely as suggestion of possible paths along which future investigation might travel.

2.—ARTIFICIAL PARTHENOGENESIS.

Problems somewhat related to those just described are the problems of parthenogenesis. By this word is meant the segmentation of an egg produced by means other than union with the sperm. Segmentation which is produced by chemical, physical or mechanical disturbance in the absence of the male element is said to be due to artificial parthenogenesis. Several years ago Dr. Loeb began the study of this subject. Previous to this time practically nothing was known with regard to it. It had been known for some time that the eggs of certain of the lower forms of animal life began to segment when they were left in sea water for a day or more. It was also known that the eggs of certain species of animals were capable of segmenting and did segment naturally without having been fertilized. In other words, the eggs of these species are naturally parthenogenetic. Of the great majority of animals, however, this is not

true, and under the natural conditions of life their eggs do not segment or develop unless they are fertilized by the male element. The main problems of parthenogenesis were to determine on the one hand the conditions which caused one kind of egg to be naturally parthenogenetic, and, on the other hand, the conditions which prevented other kinds of eggs from developing without being fertilized. And it was necessary to determine if possible what change might be made in surrounding conditions which would cause eggs not naturally parthenogenetic to develop in this way. It was hoped in this way finally to discover what part the spermatozoon actually took in the fertilization. And in the beginning it could be assumed from the fact that some eggs do develop without being fertilized that the spermatozoon probably has two functions—namely, to hasten the process of segmentation in the egg, a function in which it can be replaced by other conditions, and to carry hereditary tendencies. These, then, were some of the problems that confronted Professor Loeb in undertaking the study of artificial parthenogenesis, and his experiments have transformed this subject, about which little was known, into a definite and well controlled branch of experimental biology.

It was shown, in the first place, by Loeb that an increase in the concentration of the sea water caused marked changes in the segmentation activity of various fertilized eggs, and following this Morgan found that the addition of 1.5 per cent. sodium chloride or 3.5 per cent. magnesium chloride to the sea water caused unfertilized eggs to segment until they reached the 64-cell stage. In a long series of experiments Dr. Loeb showed that the eggs of *Arbacia* (one of the sea urchins) could be made to segment by immersing them for a little less than two hours in various solutions and then transferring them to normal sea water. These solutions were made by adding either magnesium chloride, potassium chloride, sodium chloride or calcium chloride to sea water in such a proportion that the concentration of the sea water was thereby considerably increased. In other words, the addition of these salts increased the osmotic pressure

of the sea water. The best solution was that containing magnesium chloride, and in this the eggs began to show indications of segmentation fifteen minutes after they were removed from the solution and placed in normal sea water. It was characteristic of this segmentation that no membrane was formed around the eggs such as is always formed when the egg is fertilized by the spermatozoon. The eggs developing in this way parthenogenetically as the result of an increase in the osmotic pressure of the sea water could always be readily distinguished by their lack of membrane from those which were allowed to be fertilized. In all of these experiments the most rigid precautions were taken to guard against the presence of spermatozoa in the sea water. The sea water was sterilized, and the females from which the eggs were taken were washed for a considerable time in a stream of distilled water, which kills the spermatozoa that might possibly adhere to the body. No males were touched during the experiments, and the experimenter's hands and instruments were always sterilized. Furthermore, numerous control experiments were constantly carried on.

It was therefore definitely proven that in the entire absence of the male element the eggs of *Arbacia* could be caused to divide by the addition of salts in such concentration that the osmotic pressure of the sea water was increased. This increase in osmotic pressure tends to cause a loss of water by the eggs. In some solutions this segmentation goes on until freely swimming larvæ are formed. These differ from the larvæ of fertilized eggs in some respects. They are found always swimming at the bottom of the vessel, while the larvæ developed from fertilized eggs swim at the surface of the water. In addition to this the parthenogenetic larvæ present a ragged appearance, which is due to the absence of cell membranes.

Further experiments were carried out on *Chaetopterus*, a marine worm. It was found that the unfertilized eggs of this creature could be caused to develop into swimming ciliated larvæ by simply increasing the osmotic pressure of the sea water, as was the case with the eggs of

Arbacia. Every precaution was taken here also to make it impossible for spermatozoa to be present, and control tests were made with the eggs of the same female placed in normal sea water. In these control tests no larvæ developed.

These experiments have been repeated and confirmed by a number of investigators, and the pupils of Professor Loeb have produced artificial parthenogenesis in a variety of lower animals.

In all his earlier experiments on artificial parthenogenesis Dr. Loeb had noticed that the parthenogenetic development of unfertilized eggs differed in several particulars from the development of eggs which had been fertilized. Some of those differences have already been mentioned. The fertilized eggs become surrounded by a definite membrane, while the unfertilized ones do not. The rate of development is considerably faster in the fertilized egg, and the number of eggs which develop is much greater when they are fertilized than when they are caused to develop parthenogenetically. Practically a hundred per cent. of fertilized eggs develop, while the percentage of unfertilized eggs which could be caused to develop by increasing the concentration of the sea water was less than 20 per cent., often only 1 to 2 per cent. In addition to these differences it was characteristic for the larvæ derived from unfertilized eggs to swim at the bottom of the vessel, while those from fertilized eggs remained at the surface of the water.

During the present year Dr. Loeb has discovered a method by which these differences are almost entirely done away with and the development of unfertilized eggs brought about in a way quite similar to that of eggs which have been fertilized. Thinking that the increase in the concentration of the sea water imitated only one part of the changed conditions normally brought about in the egg by the entrance of the spermatozoon, Dr. Loeb experimented with a number of organic substances in an attempt to imitate other conditions which might possibly exist. He found finally that if unfertilized eggs were first treated with the concentrated sea water and then allowed to remain a very short time in a solution of ethyl-acetate nearly a hundred per

cent. developed. And these developed just as the eggs which have been fertilized develop; they formed a membrane; they developed with the same rapidity as the fertilized eggs, and the larvæ swam at the surface of the water instead of at the bottom. In other words, the process of fertilization was accurately imitated by physical and chemical changes in the conditions of the eggs. It was found later that ethyl-acetate could be replaced by acetic acid, formic acid, or almost any of the acids of the fatty acid series. The ethyl-acetate probably owes its action to the free acetic acid which it contains in solutions which are not perfectly fresh.

This brief outline of the work on parthenogenesis will serve to show how Dr. Loeb's experiments have gradually cleared up this difficult field of investigation, so that now the segmentation of the egg may be almost perfectly controlled by physical and chemical means. Many problems remain to be solved, and with these perfect methods we may look for results of great interest in the near future.

3.—ANIMAL HELIOTROPISM.

It has been known for a long time that plants which are grown in a room bend toward the light. This tendency to react to light has long been known as heliotropism, and those plants or parts of plants which bend toward the light were called positively heliotropic, while those which bend away from the light were termed negatively heliotropic. The details of these phenomena have been thoroughly worked out by botanists, and many theories have been advanced to explain the mechanism of the bending. It was found also that the light of short wave length—*i. e.*, in the blue end of the spectrum—exerted a much more powerful influence on the heliotropic movements of plants than the red rays.

Professor Loeb was the first to point out that the same reactions toward light which are characteristic of plants are possessed also by animals. He called attention to the analogy which exists between the flight of a moth toward a flame and the bending of a plant to the light. If the plant were capable of independent locomotion it would be forced to move progressively to the light, just as the

moth is compelled to move in that direction. By experiments extending over a number of years Dr. Loeb proved absolutely that many animals are subject to the influence of light. In some cases this is so marked that their whole lives seem to be controlled by changes in light.

Eudendrium is a marine hydroid which consists of a stem with lateral polyps. If these animals be placed in an aquarium which is illuminated from one side only the polyps gradually bend toward the light. The light falls at first on one side of the polyp, which bends until the rays fall upon it symmetrically. As soon as symmetrical surfaces of the polyp are stimulated equally by the light the bending ceases, and the polyp merely continues to grow toward the light. This is true in general for heliotropic movements. In plants as well as in animals the light falling on one side of the organism causes a concentration or contraction of the protoplasm in that region, so that the organism is mechanically turned until the light falls equally on the two sides. It seems that in the surface tissues of these animals there must be a substance which is sensitive toward light, and is perhaps changed chemically by changes in light intensity. Such a change causes the protoplasm on the side upon which the light falls to contract or become in some way more concentrated, so that a bending must take place in that direction.

Dr. Loeb found that the more refractive rays of the blue end of the spectrum are much more powerful than those of the red end in producing heliotropic curvatures in animals. This is true also of plants.

Eudendrium is a sessile animal, remaining fixed in one place like a plant. The same heliotropic reactions, however, occur in freely swimming animals, such as Gammarus, which is a fresh water crustacean. These are ordinarily negatively heliotropic, gathering always at the side of the vessel away from the source of light. Working with these animals Professor Loeb has recently made a very important and interesting advance in the knowledge of heliotropism. As suggested above, the change which light brings about in the surface of the animal is probably a chemical one.

It seemed to Dr. Loeb therefore that the heliotropic movements should be subject to control by chemicals, and an attempt was made to accomplish this by changing the composition of the water in which the animals lived. It was found that if a small amount of a dilute acid be added to the water containing Gammarus, these animals, which in pure water collect at the dark side of the vessel, almost immediately move toward the window side. In other words, the addition of an acid such as hydrochloric, acetic, or oxalic acid makes the negatively heliotropic animals positively heliotropic. The same result is obtained with carbon dioxide and with certain substances such as alcohol and paraldehyde. This seems to show that the heliotropic movements depend on a chemical change brought about by the light. The older view that an animal swims or flies toward the light because the light has a fascination for it, or because it likes the light, cannot be held. Such reactions lead as often to the destruction of the animal as to its well being, and we must conclude that movements brought about by light are involuntary and probably chemical in origin.

These are the main problems which have occupied the attention of Dr. Loeb during the past few years. Important discoveries in other fields were made previous to this, but cannot be included in so brief a review. These subjects included heteromorphosis, or the replacement of one organ by another. For example, the stem of Tubularia, which ordinarily grows polyps at one pole and roots at the other, was made to grow polyps in place of roots by reversing the stem in the sand. Other experiments were concerned with the action of various salts on the animal body, but these results cannot be stated in a few words. Dr. Loeb's work on the physiology of the brain is easily available, as it is published in book form and in large part could be read understandingly by those without scientific training.

Experiments which are being constantly continued by Dr. Loeb promise to add still further to our scientific riches, and it is hoped that within a few years many more obscure places in the study of life phenomena will be cleared up.

Political and Other Life in England

BY JUSTIN MCCARTHY

THE Parliamentary session draws toward its close. In the ordinary course of things a session must come to an end in the early part of August and the probabilities of a dissolution and an appeal to the country this year seem less apparent than they were some few weeks ago. The Government have a great many measures in hand, but do not appear by any means disposed to hold them in hand with anything like a firm grasp and have to all outer evidence only taken them up in order to make a show of at least trying to do something. The great question still is whether Mr. Balfour is to subdue Mr. Chamberlain or whether Mr. Chamberlain is to conquer Mr. Balfour, and the prospect at present seems to be in favor of Mr. Chamberlain's victory. "Joseph," as he is familiarly called, has the great advantage of knowing what he wants to do. His present object is to put himself at the head of affairs on the Conservative side, and we all know that where a purpose of that kind impels him he is not an easy man to turn out of his course. Mr. Balfour on the other hand has little or no personal ambition to gratify. His soul is not and never has been in political life and I do not think he feels any particular pride in being the Prime Minister of the British State. My own impression is that once the trouble of the struggle were over, whether the struggle be with Chamberlain or with the constituencies, Arthur Balfour would feel quite happy if relieved of the dignity and the weariness of leading an Administration.

Chamberlain, who had been keeping determinedly in the background for some time, has lately come to the front again. He has been holding great meetings and delivering speeches in which he has made uncompromising declarations that there is no essential difference of opinion between Mr. Balfour and himself and that they will carry the whole Conservative Party along with them. Now it might surely be assumed that on such a ques-

tion as this Mr. Chamberlain must mean what he says and must also thoroughly understand what he is talking about and thus far at least Mr. Balfour has said nothing to the contrary. At the same time I must say that I personally should not feel much inclined to accept Mr. Chamberlain's declaration as actually conclusive on the question and I should much like to know what Mr. Balfour himself when conversing in private with his personal friends declares to be his opinion on the subject.

I may say that if I were a Conservative in politics, which, as the readers of THE INDEPENDENT may possibly know, I certainly am not, my personal sympathies would go much more with Mr. Balfour than with Mr. Chamberlain. I believe Mr. Balfour to be a thoroughly sincere man and entirely without personal ambition and I cannot say that I could venture to sum up Mr. Chamberlain's character in quite the same terms. But in the case

A. C. SWINBURNE

of a direct struggle between the two men in a political career, one of whom knows exactly what he wants to do and is not over particular as to the means of doing it, and the other of whom has no definite end of his own to accomplish and would probably be rather particular as to the means of accomplishing any personal end, the chances are much more in favor of the former than of the latter. I should think Mr. Balfour would be quite happy as an unofficial member of the House of Commons or even of the House of Lords.

THE LATE GEORGE GISSING

Either chamber would be to him an agreeable place of relaxation, a place in which to hear debates now and then and occasionally when he felt so inclined to take a part in them and to have meanwhile plenty of time for his literary and his artistic studies and for the society of his chosen friends. Mr. Balfour is a lover of books and of art and of intellectual fantasies and their study and culture and never so far as I can judge could become wholly absorbed in the practical work of political life.

Just now I wish more than ever that Mr. Balfour had settled himself down to this career as an amateur in politics at

HENRY W. LUCY

any time before the present session. He would then have been saved from the discredit of introducing as Prime Minister that measure for the redistribution of parliamentary constituencies in Great Britain and Ireland, the details of which were submitted to the House of Commons a very few nights ago. I have already given my readers of *THE INDEPENDENT* my anticipations as to the character of this measure, but I had still even then a hope that such a measure could never be seriously introduced by any administration in the closing days of a Parliament. Now however the House of Commons has had the details of the measure set before it in a series of resolutions and we know that it is in substance merely a proposal to make a sweeping reduction in the representation of Ireland. The proposal is that 22 constituencies in Ireland shall be deprived of representation. The spoils of this capture are to be divided among England, Scotland and Wales. Seventeen new seats are to be given to England, four to Scotland and one to Wales. This is the most important part of the proposed measure, and it need hardly be said that such an attempt will be resisted

to the very last by the Irish Nationalists and by all true Liberals in England, Scotland and Wales. Let it be remembered to begin with that as I have pointed out to the readers of THE INDEPENDENT already the Act of Union which extinguished the Irish National Parliament affirmed that the representation of Ireland in the Parliament of Westminster should consist of not less than 100 members. At present it consists actually of 103 members and therefore the proposed reduction would bring the representation of Ireland very much below the figure appointed for it by the Act of Union itself. This means, to begin with, a repeal of one part of the Act of Union, and the Government who admit to the people of Ireland that the Act of Union may be properly altered in any one of its leading clauses can hardly any longer continue to treat as a movement of mere rebellion the effort of the Irish National Party to repeal the Act altogether. It must be remembered that the reason given by the Government for the proposed reduction in the number of Irish representatives is the fact that the Irish population has of late years greatly diminished and it must be remembered at the same time that this diminution is entirely and absolutely due to the evil legislation with which successive English Governments have afflicted the Irish people and have rendered it impossible for Irish tenant farmers and Irish laborers to make a living on their native soil. The Irish population, the men and women born on the Irish soil or born of Irish parents, have not diminished in the meantime but have greatly increased in numbers. Irish men and women, the great majority of them, have found a home in America, where they can earn their living in comfort and can rise to prosperity, and in the Australasian colonies, where like conditions await them. To drive millions of the people out of their native country in the first instance and then to insist that because these millions have preferred emigration to starvation, the remaining millions must be partially disfranchised is hardly a policy which can find favor in the mind of any intelligent and true-hearted Englishman whether he be Liberal or Conservative. This new effort at legislation if pressed forward is sure

to create something like a convulsion throughout Ireland and to arouse a feeling of impassioned resistance among Irishmen all over the world. I cannot believe that Mr. Balfour really hopes to carry such a measure without a preliminary appeal to the whole constituencies of Great Britain and Ireland at a General Election and I cannot help deeply regretting that he should ever have allowed his name to become associated with such a policy.

The arrival of Mr. Whitelaw Reid as American Ambassador in London has been the occasion of many demonstrations of welcome. The lamentable death of John Hay interrupted for a time many of these genial demonstrations, for John Hay was well known to this country, not only in his capacity as a statesman but also as the author of poems which were admired and loved in every English home where the blending of humor and pathos in poetry can be appreciated. But the welcome to Whitelaw Reid was only interrupted for the time and is sure to find many and many a mode of expression as the new Ambassador comes to be better known here. The speeches made by Whitelaw Reid have been received on several public occasions with enthusiastic applause and I feel certain that his stay in England will do much to increase and intensify the friendly feeling between these countries and the United States. The opening of Whitelaw Reid's career as American Ambassador to the English Court is one of the great events of the year.

The action brought by Mr. Moy Thomas the younger against the proprietors of *Punch* and Mr. Henry W. Lucy has been the subject of more comment and more talk in London and all over these countries than any other legal proceedings which have taken place in a Civil Court here for a long time. I have no doubt that among American readers generally the case must have excited a very lively interest. Henry Lucy is the "Toby, M. P." of *Punch*, to which lively periodical he also contributes many literary reviews, and it was in this latter capacity that he wrote the article on Mr. Moy Thomas's book which has created so much sensation. The book which he reviewed was the life of the late Sir John

R. Robinson, manager, and lately editor also, of the *London Daily News*, a paper on the parliamentary reporting staff of which Mr. Lucy served for many years not as a shorthand reporter of speeches, but as a writer of clever and humorous descriptive and picturesque articles—a paper of which he was for a short time the actual editor. When Sir John Robinson died he left behind him some written memoranda for an autobiography. Sir John had during his long career as a newspaper manager become acquainted with almost every prominent mover in the political world at home and with many such men from abroad, and his impressions of such men must have formed most interesting and valued reading for the public in general. Mr. Moy Thomas undertook to prepare the biography. Mr. Moy Thomas and his father both held influential positions on the staff of the *Daily News*, and it probably seemed quite reasonable that he should undertake to put into shape the story of Robinson's working lifetime. When the work appeared Mr. Lucy attacked it severely in the columns of *Punch*, whereupon Mr. Moy Thomas brought an action against him and the proprietors of *Punch* and succeeded in obtaining a verdict for £300 damages and costs. I must say that the biography appeared to me absolutely valueless as a record of the experiences of Robinson and it had in fact comparatively little about Robinson himself in its pages. Mr. Lucy, however, used, I suppose, some rather strong expressions of condemnation regarding Moy Thomas and his mode of working up biography and these I presume influenced the judge and the jury in deciding against him and the proprietors of *Punch*. The general feeling of the public is, I think, that even though Lucy may have been sometimes too harsh in his condemnation of Mr. Moy Thomas there is yet much danger in any course which condemns a critic to pay damages for expressing his literary opinion of a book even in the strongest terms. Every one who knows Henry Lucy—I have myself known him intimately for more years

than I care to reckon up—must know that he is one of the most good natured of men, as kindly as he is brilliant, and that is saying a great deal. He has made his way to his present high position in the literary world by sheer ability, by wit and humor, by hard work and resolute perseverance, and I am sure it may be taken for granted that he will not suffer much in public estimation even from this adverse verdict and that the proprietors of *Punch* will still be able to find readers enough for their famous publication.

Two novels which have just been published illustrate in peculiar fashion the opening of one great literary career and the close of another. The first is "Love's Cross Currents," by Algernon Charles Swinburne (Harper Brothers, New York), and the second is "Will Warburton," by the late George Gissing (E. P. Dutton & Co., New York). Swinburne's novel is his first and thus far his only attempt at prose romance. George Gissing's is the last work written by that really great novelist before his death. Swinburne's novel was kept in concealment by its author for many years and was only brought into publicity in comparatively recent days, first in England and then I think in New York, and without Swinburne's consent. Now he has been induced by the persuasion of his dear and devoted friend and comrade, Theodore Watts-Dunton, himself a gifted and a brilliant writer, to issue an authorized and completed version of the book, seeing that it is no longer possible to withhold it altogether from the public. The novel on the whole seems to show that Swinburne was entirely too modest when he strove to keep his first effort at prose romance from the outer world and I entirely agree with Watts-Dunton in believing that the outer world has a right to its possession. Sir Walter Scott was famous as a poet before he ever published a novel, but his novels only gave him a new and a greater fame. I feel sure that the fame of Swinburne the poet will at least not suffer any diminution from the appearance of Swinburne as a novelist.

LONDON, ENGLAND.

The State as Employer

BY GEORGE W. ALGER

[Mr. Alger is a New York lawyer who for a number of years acted as counsel for the State Federation of Labor. He drafted the amended bills covering "the prevailing rate of wages" and the eight-hour law, and also drafted the employers' liability law and engineered it through the Legislature.—EDITOR.]

THE question of what should be the relation of the State as employer to its employees is not merely an abstract question of law, but is much more one of applied ethics. With the enlarged conceptions of the functions of the State now firmly established and with the enormous expenditures which are being made annually for so-called public works involving the direct or indirect employment of thousands of workmen, the determination of this question of ethics becomes more urgent and important. Shall the State recognize as its duty that obligation which every high-minded employer recognizes of treating employees fairly, paying them a proper wage and requiring from them only reasonable hours of service, or shall it repudiate all moral obligation and upon a basis of lowest commercialism consent that the longest hours and the lowest wage shall be imposed which the market of men affords? We see these two questions daily asked and answered by employers in the business world, the closest parallel to the State as employer being those private corporations whose officers must decide whether, in justice to their stockholders, they owe any moral obligation to pay employees more than the lowest market rate, or whether the stockholders are not entitled as dividends to the sums wrung by the stern law of supply and demand from the necessities of the men who earn them.

New York decided some years ago the position which its citizens thought the State should take as an employer of labor. The legislature, representing the people, decided that the State should not only itself pay fair wages for fair hours, but should insist that its work done by its contractors should be performed on similar terms. A statute was enacted expressing that principle, one provision

of which was that eight hours should constitute a legal day's work for all employees on public work, and another, that the wages to be paid upon public work should not be less than the prevailing rate for a day's work in the same trade where such public work is performed. The law required each contract for public work to contain a stipulation to the effect that each workman employed by the contractor or subcontractor should be employed such hours and receive such wages. This statute decided in effect that the State had an interest in the way employees were paid, who built its public works, and the length of hours in which they labored; that in the same way in which a citizen might refuse to wear garments made under sweat shop conditions the State itself might refuse to have its public works done by contractors utilizing the padrone system and refusing to pay their workmen what justice requires.

The entire moral principle underlying this legislation was, however, repudiated, so far as contractors on public work are concerned, by two decisions of New York's highest court and the right of the State itself to regulate the wage terms of contractors with it denied. The first portion of this statute to be attacked was the one relating to wages. A contractor having obtained a contract in which he agreed to these wage conditions required by the State, and having undoubtedly obtained a larger contract price than he would have obtained if this provision had not been part of the bargain, deliberately violated his contract, and the Comptroller of New York City having refused, on account of this violation, to pay him the balance claimed upon the contract, he brought action to compel such payment, claiming that the so-called prevailing rate

of wages law was unconstitutional, and that he was not bound to comply with his contract so far as it provided for the wage payment of his employees. The highest court in New York, by a divided court, sustained his contention. It held this prevailing rate of wages law to be in violation of the State constitution, "because it permits and requires the expenditure of the money of the city or that of the local property owner for other than city purposes," the reasoning of the court on this proposition being in effect that anything above the lowest market rate is in effect a gratuity. A further ground for holding the wage law invalid was found in the fact that it prevented the city and the contractor from agreeing with their employees upon the measure of their compensation.

This decision (*People ex. rel. Rogers v. Coler*, 166 N. Y.) in effect holds that the right to obtain labor at the lowest possible rate is an inalienable right and duty of the State and its cities, and that legislation which requires on public work the payment by contractors of a prevailing or ordinary rate of wages (not, it is to be observed, *more* than the usual wages current among workmen of a given class) is beyond the power of the legislature. The Chief Justice of the Court, Judge Parker, in a singularly able opinion, dissented from the prevailing judgment of the court, and said:

"The legislature, which is vested with the power to direct the conduct of the business operations of the State by this statute, has not only declared it to be the policy of the State, as a proprietor, to pay the prevailing rate of wages, but has enjoined upon its several agents and agencies the duty of executing this policy. An attack upon this statute, therefore, assails the right of the State, as a proprietor, to pay such wages as it chooses to those who either work for it directly or upon any work of construction upon which it may be engaged."

The decision of the majority of the court Judge Parker describes as a "judicial encroachment upon legislative prerogative." He says upon the question of public ethics involved in this case:

"It would seem to follow that the position taken by the State in enacting this statute was precisely like that of an individual who for any reason determines that if it would be a

little more honest, as that term is usually applied, it is not more than just to pay for a thing what it is fairly worth, and that the principle should be applied as well to the compensation of labor as to the payment for material."

The balance of the statute, the portion of it which provides for the hours of work and prohibits a contractor with a State or a city from requiring more than eight hours a day for labor on public work, was also (*People v. Orange County Construction Company*, 175 N. Y., 84) held by the highest New York court to be unconstitutional as violating the Constitution of the United States.

This Construction Company had been indicted for requiring more than eight hours' work from its employees in the performance by it of a contract for the improvement of a public highway, a violation of this provision of the labor law being a misdemeanor. The court held that this statute, prohibiting a contractor with the State or a municipal corporation from requiring more than eight hours work for a day's labor, had no relation to the public health, morals, or order, and cannot be upheld as a valid and constitutional exercise of the police power vested in the legislature, and as it applies only to contracts with the State or municipality, it creates an arbitrary distinction between persons contracting with the State or a municipality and other employers of labor, thus violating the provision of the Federal Constitution forbidding any State to "deny to any person within its jurisdiction the equal protection of its laws."

Under these two decisions the entire policy of the people of New York, as indicated in this statute, was apparently nullified. The Court of Appeals practically held that on the highly important question of the business morals of the State itself the people were precluded from reaching a determination which they thought was just. If these decisions of New York's highest court should be followed in other States a more helpless situation for those who believe that the State should be a model employer can scarcely be imagined.

A very recent case decided by the United States Supreme Court (*Atkins v. State of Kansas*, 191, U. S., 207),

one of the most important decisions ever rendered in this country on law in its relation to labor, has, however, placed this problem so far as other American States are concerned in an entirely different light. The case in which this decision was rendered arose out of a Kansas statute enacted in 1891, by which a rule of conduct had been adopted by that State practically identical with that of New York. The statute differs from the New York statute in its wording, but is identical in its principle, both as to the hours and the wages to be paid employees. This statute (3827 of General Statutes of Kansas) provides for an eight-hour day for all laborers employed by or on behalf of the State or by any county or city, except in cases of extraordinary emergency, etc. It provides further that all public contracts shall be deemed to be made on the basis of eight hours, and that it shall be unlawful for any corporation, etc., to require or permit any workman to work more than eight hours per calendar day, except in cases of extraordinary emergency, and that

"any officer of the State or any contractor with the State violating the statute shall be punishable by a fine of not less than \$50, etc., or by imprisonment."

In this case a contractor named Atkins, who had entered into a contract with the Mayor of Kansas City for the opening of public streets, hired one Reese, a common laborer, to work for him in laying pavement. Reese was required to work more than eight hours a day. Atkins, his employer, was for this convicted of a violation of this law, and he appealed to the Supreme Court of the State. The law had been previously considered by that court and held to be constitutional (*in re Dalton*, 61 Kansas, 257), and following that decision his conviction was affirmed and he appealed to the Supreme Court of the United States.

It is obvious from a very cursory examination that the decision of the Kansas Court involves the same principle as the New York Eight-Hour law case cited above (*People v. Orange County Construction Company*) and reaches a precisely contrary conclusion. The Supreme Court of the United States has now held

the Kansas decision to be correct, and in effect reversed the New York Court of Appeals so far as that case held the New York Eight-Hour law for public work to be a violation of the Federal Constitution. The Supreme Court does not even indulge in a doubt as to the constitutionality of this Kansas statute. "Indeed, its constitutionality is beyond all question." On the principle of the right of the State to act as a model employer unaffected by an constitutional limitations, the Supreme Court says:

"Whatever may have been the motives that controlled the enactment of the statute, we can imagine no possible ground to dispute the power of the State that no one undertaking work for it or for one of its municipal agencies shall permit or require an employee to labor in excess of eight hours each day, and to inflict punishment upon contractors who disregard such a regulation. *It cannot be deemed a part of the liberty of any contractor that he be permitted to do public work in any mode he may chose without regard to the wishes of the State. On the contrary, it belongs to the State, as guardian and trustee for its people, to prescribe the conditions in which it will permit public work to be done. No court has authority to review its action in that respect.*"

This decision is an authoritative finding that, so far as the Constitution of the United States is concerned, the States have full power to pass statutes providing the terms and conditions under which public work may be done as to the hours of labor which shall be expected of employees performing such work. The decision is important because heretofore hour legislation has been upheld solely on the ground of the interest of the State in the public health, and as an appropriate exercise of police power. The well-known Utah Eight-Hour law was sustained by the United States Supreme Court solely on this ground.

The present decision of the Supreme Court is based not at all upon any police power of the State, but upon an affirmation of the State's right as employer to determine what terms and conditions of labor are just on work done on its behalf, and on its further right to insist that those terms be carried out even by punishing criminally those who violate them. The decision is important further because similar statutory regulations of the hours

and conditions of labor exist in many States, and the decision will be a powerful argument for sustaining them before local courts. Statutes in principle similar to the New York and Kansas statutes, and covering either State employment alone or employment by the State and its contractors, exist, for example, in Massachusetts, Indiana, Colorado, Idaho, Wyoming, Utah, Texas, Washington, Porto Rico, Tennessee, West Virginia and Maryland, and have been enacted covering direct Governmental employment only by the Federal Government.

In England, since 1891, a resolution of the House of Commons, the so-called Buxton rule, provides that *in all Government contracts* it was the duty of the Government "to make every effort to secure the payment of the rate of wages generally accepted as current for the competent workman in his trade."

Singularly enough the first State to be influenced by the Supreme Court decision is New York. In February of last year the Court of Appeals, in *Ryan v. City of New York*, 177 N. Y., 271, by a close vote of four to three, modified its previous determination that the Prevailing Rate of Wages law was unconstitutional. It now upholds that law, so far as it applies to the workmen directly employed by the State or its cities. The earlier case had been one in which the wages in question were those of employees of contractors. The present status of the New York Wage law as determined by its highest court is briefly this: The Legislature may lawfully provide that the State and its cities shall pay fair wages (not less than the prevailing rate) to its own employees, but if public work is done, not by direct public employment but through agents and contractors, the Legislature has no power to prescribe what wages these agents shall pay who voluntarily contract to do public work. In other words, if a city does its own public work by direct employment it must pay the prevailing rate of wages to its employees. If it, however, *does the same work through contractors* it must not and cannot require the contractors to pay similar wages. By similar reasoning in its most recent decision (*People Ex rel Cossey v. Grout*, 179 N.

Y., 417) the New York Court of Appeals has again found the Hour law on public contracts to be unconstitutional. The United States Supreme Court having held that the Federal Constitution does not forbid such legislation for fair hours for employees on public work, the New York court has been forced to change the basis of its decision against the Hour law from the Federal Constitution to the Constitution of the State; and its latest conclusion that the Hour law on public contract work is unconstitutional is now founded upon an extraordinary and novel right which it says the towns and cities have under the State Constitution as against the State which creates them, and which, if it chooses, can destroy them—the right to have their contract work done in the very cheapest market. The New York judges disagree in their reasoning in this as in most of the labor law cases which they have decided, but they agree on at least one conclusion: "Where the municipality lets work by contract it is itself interested only in the result obtained, and if that result complies with the requirements of the contract it is immaterial to the State what the contractors' employees may have been paid or how long they may have worked." As expressed in another of the opinions written in this case: "It was not of the slightest consequence to the city whether he (the contractor) permitted his workmen to labor eight hours or nine so long as he produced and delivered the property that he agreed to deliver."

The logic of the present status of the New York law under these decisions need not be discussed here. The important question is, Do these quotations given above express the sentiment of the majority of citizens on the duty of the State as employer? If they do not, these New York decisions are not necessarily final even in that State. For there is no permanent triumph which the courts can make over the moral sense of the people by which they are created. There is always a further appeal from the courts to the people, and the decision on that appeal, tho it may be slow, is no less sure. No reactionary decisions of any court have ever permanently retarded the expression of a moral principle in public law.

The principle underlying the legislation which has been here considered is, from the standpoint of public morals, absolutely just and proper. That such statutes in actual operation have occasionally been attended with considerable abuses cannot be denied. Space will not permit a consideration of their cause, or more than the statement that they do not necessarily grow out of the statutes

themselves. These abuses would be few indeed were the interests of the State or its cities properly represented by conscientious law officers, whose usefulness is unwarped by hope of judicial preferment, and who do not forget their present public duties in a desire to conciliate, at the expense of tax payers, the so-called labor vote.

NEW YORK CITY

A Pine King

BY JESSIE STORRS FERRIS

OLD age is his, and seasons honorable;
Oh, he could tell
The runic forest histories full well,
The legends that the locust cherisheth,
The secrets that the cedar breathed 'ere death,
And threnodies the greenwood murmureth.

His stalwart head
Is shorn and gray, that once wore coronal
Of pungent perfumes. In the lingering Fall,
When brother trees glowed red
With the keen flush of frost, he greener grew
Against November's skies of boreal blue.

When naked Winter wailed about his knees,—
Chieftain of trees,—
And the great gusts blew chill from overseas,
When the mad storm gnashed noisy teeth of
hail
Over prone glade and ice-gyved, shivering
vale,
Did that old viking, valiant heart once fail?
And when the snow
Laid hushing finger on the woodland's lip,
Silent and stark he bore the stinging whip
The cold snapped, blow on blow;—
What craven fear was there that he should
know,
Who donned the forest purple long ago?

On April days, sun-waked and warmed again,
He lists the wren
That builds his home deep in the marshy glen.
He hears the hermit thrush at evening
Pour forth his hymn, and sees afar the wing
Of great wild-goose flocks, northward voyag-
ing.

Anemones
And dog-tooth violets, starry trilliums, meet
Like shy, sweet children, there about his feet.
To his old heart, all these
Are sacred from long centuries of springs,
And dear with promise of companionings.

But not till Summer brings her pulseless heat
Is joy complete
For him whose years pass like a runner's feet.
Then the long moonbeams pierce his boughs,
and green
Glowworms light all his mossy, dark demesne.
His youth is with him once again; the keen
Old life-lust burns
In sapless veins and branches needleless.
Not his the quailing and the sharp distress
Of human Age; he spurns
The prop of pity and the crutch of care.
He is a King,—oh, hew him, ye who dare!

BUFFALO, N. Y.

Literature

A Musical Pioneer

THE only regret of the several thousand friends of the late Theodore Thomas who will be sure to read his *Autobiography** will be that it is too short, that it does not tell enough about his remarkably long, significant and interesting career. It fills only a scant 90 pages of the first of the two volumes Mr. Upton has arranged, which together run to more than 700 pages. Yet, brief as the sketch is, it provides a graphic and fascinating account of the trials, struggles, hardships, disappointments and final triumphs of this musical pioneer. And to those who knew him only as he appeared in public leading his great orchestra it presents Theodore Thomas (without any conscious contrivance on his part) in a new light, revealing, besides his known perseverance, his indomitable will and unfailing courage, beneath the somewhat brusque exterior the kindly nature of the man, his humor, sympathy and amiability: qualities of mind and heart unsuspected by the thousands whom he educated to an appreciation and enjoyment of the loftiest music.

Throughout his life of seventy years Theodore Thomas was one thing—a musician. His mind was single, his purpose was steadfast and his devotion to his art was complete. And he writes as one who did things rather than one who told about them. By way of preface he says:

"I wish to begin with a statement, to which my friends will bear witness, that I never intended to write my autobiography, or anything else; I desired only to preserve my programs—representing over half a century of a very important part of the history of music in America—in some permanent form, and this is the result."

His little autobiography gives a clear and succinct record of the development of music and musical taste in America

from the time of his coming in 1845, when "the metropolitan city was a provincial town of two-story houses and the pigs ran through Broadway and ate the refuse," and when "the only resource open to an instrumentalist was to join a brass band and play for parades and dancing," down to the present year.

Mr. Upton's contribution to the first volume comprises thirteen chapters of "Reminiscence and Appreciation," wherein Mr. Thomas's own account of his labors is well supplemented with fuller dates and details. There are many delightful and characteristic little stories of the man—exemplifying his great strength, physical, mental and moral, his simplicity and modesty, his brusqueness with strangers and his constancy in friendship, his love of culture, his American patriotism—and several examples of his caustic wit in dealing with the boor in public, the bumptious amateur and the recalcitrant singer or instrumentalist. The following story is told of his aversion to public speaking:

"Once in Cincinnati, at a banquet given to him, he was called upon to reply to a toast to his health. It is said that he arose, tried to speak, murmured a few words and sat down, like Thackeray at the Boston banquet, whereupon Michael Brandt, the 'cellist, rose and said that Mr. Thomas ought not to be expected to make a speech,—'He is a *Lieder ohne Worte*.'"

For his second volume Mr. Upton has selected some 1,200 of the most representative programs from the 10,000 made and used by Mr. Thomas in the half century of his leadership. These attest the great conductor's unique skill in program-building and his catholicity of taste, and form, as Mr. Upton justly says, "a complete musical education system." They make a record of the highest value to historians, conductors and musicians in general, and they are introduced by an equally valuable essay by Mr. Thomas, setting forth his method of program-making and commenting on the encore habit, on habitual late comers and on the modern orchestra technic.

* THEODORE THOMAS. *A Musical Autobiography*. Edited by George P. Upton. Vol. I, *Life Work*. Vol. II, *Concert Programs*. Chicago: A. C. McClurg & Co. \$6.00 net.

A final record of "Works Introduced into This Country" by Mr. Thomas is a disappointment and lacks the expected value because of its many inaccuracies and misstatements. Mr. Thomas was in the habit of putting the words "First Time" after a title on his programs when the work in question was to have its first performance under his direction, by his orchestra, or in the city where the concert was given. Mr. Upton seems to have taken those words to mean invariably "First time in America." His assurance, therefore, that the list "may be relied upon as correct" becomes worthless.

Anglican, Presbyterian and Independent.

LECTURES and treatises on Church History from an avowedly denominational point of view still appear in considerable numbers, as well as theological expositions and sermons which bear unmistakably the stamp of the particular religious communion from which they sprang. They are not of necessity the product of offensive partisanship, but are often due to the desire to set forth worthily the faith of one's fathers, or to instruct the adherents of a particular communion in the duties which lie nearest and in those features of one's religious inheritance that are most commendable. Such productions, especially in Church history and biography, should be used with caution and with full comparison with works more nearly impartial, but they have their value in stirring the adherents of a Church to interest and loyalty.

As illustrative of the best spirit among Anglicans we may mention Dr. Plummer's *Lectures on English Church History*.¹ The period chosen is the intensely dramatic and important one of the conflict of Roman Catholic, Presbyterian and Puritan in the seventy-five years preceding the execution of Archbishop Laud and the death of Charles I. Dr. Plummer takes great pains to be fair, and he is by no means blind to the

faults of the Archbishop and the King, nor those of Elizabeth and James I, yet he is a thoroughly convinced Anglican and his lectures are partisan history. His ability to suppress unimportant details and to enforce essentials, his orderly method and clear English make his book a delight to read.

One who has been taught to think that there is no longer a Broad Church school in the Church of England should attend to the sermons of Mr. Rashdall,² from which he will learn that the spirit of Maurice and Kingsley and Robertson is very much alive. The author is liberal in theology, and one of his best discourses was delivered before the "Churchmen's Union for the Advancement of Liberal Religious Thought." He writes to correct the impression that "liberal theology necessarily leads to a negligent or disrespectful attitude toward all external expressions of the religious life," and his aim is to win over men of culture to a more cordial attitude toward the Church.

The alertness and enthusiasm of the High Churchmen in the Episcopal Church find interesting expression in the sermons of Bishop Grafton.³ Readers of THE INDEPENDENT do not need to be told that the Bishop of Fond Du Lac is an able writer, and his sincere devoutness as well as his narrow faith come plainly to light in this plea that men become Christian, and also Catholic, but "Catholic, not Roman."

Passing from Anglican to Presbyterian, the careful lectures of the late Dr. Hastie, Professor of Divinity in the University of Glasgow, are deserving of first mention.⁴ Dr. Hastie was a worthy representative of the more conservative Scotch theologians, a man untouched by the modern critical movement, yet a learned scholar and an able thinker. By the Reformed Theology he means Calvinism, without dilution or modification, inclusive even of absolute predestination

² CHRISTIUS IN ECCLESIA: *Sermons on the Church and Its Institutions*. By Hastings Rashdall, D.Litt., D.O.L. New York: Imported by Charles Scribner's Sons. \$1.50.

³ CHRISTIAN AND CATHOLIC. By the Rt. Rev. Charles C. Grafton, S.T.D. New York: Longmans, Green & Co. \$1.00.

⁴ THE THEOLOGY OF THE REFORMED CHURCH IN ITS FUNDAMENTAL PRINCIPLES. By the Late William Hastie, D.D. Edited by William Fulton, B.D. New York: Imported by Charles Scribner's Sons. \$2.00.

¹ ENGLISH CHURCH HISTORY, FROM THE DEATH OF ARCHBISHOP PARKER TO THE DEATH OF KING CHARLES I. By the Rev. Alfred Plummer, M.A., D.D. New York: Imported by Charles Scribner's Sons. \$1.00.

and the *decretum horribile*. His exposition is unique in the stress it lays upon the influence of Reformed Theology upon modern faith in the personality and self-communicating will of God.

How many can remember in the old family library Dr. Gillett's "History of the Presbyterian Church"? Those two imposing volumes covered only the history of the Presbyterians in the United States, but Dr. Reed⁵ relates also the fortunes of the Presbyterian Churches in Switzerland, Scotland, The Netherlands and wherever the Presbyterian polity has been extended. He writes in utmost sympathy, even as a partisan, but he has collected many facts not easily accessible, including statistics of the officers, members and contributions of all Presbyterian Churches and Missions in the year 1904.

Mr. Beveridge's account of the Westminster Assembly⁶ aims to be a brief, popular manual, and, like all histories of that council, it is much enlivened by copious extracts from the quaint and entertaining journal of Robert Baillie.

Scottish Presbyterianism has no more useful and honorable minister than Dr. Alexander Whyte, senior minister of Free St. George's, Edinburgh. His studies in Bible characters are innocent of criticism, but beautifully devout and sweetly Christian. The present volume⁷ is composed of original, somewhat visionary, studies in the Life of Christ.

The Congregationalist Dr. Jefferson may be given the English title Independent. His Shepard Lectures at Bangor Seminary⁸ are straightforward utterances of common sense on the subject of preaching. He knows how to put things and what things ought to be put. His views on the importance of preaching, his statement of the need of good preaching and his plea for a return of doctrine in preaching will make a deep impression wherever they are read. There are many books on the Christian ministry, and few are smaller than this and few more valuable.

⁵ HISTORY OF THE PRESBYTERIAN CHURCHES OF THE WORLD. By R. C. Reed, D.D. Philadelphia: The Westminster Press. \$1.25.

⁶ A SHORT HISTORY OF THE WESTMINSTER ASSEMBLY. By W. Beveridge, M.A. New York: Imported by Charles Scribner's Sons. \$1.00.

⁷ THE WALK, CONVERSATION AND CHARACTER OF JESUS CHRIST OUR LORD. By Alexander Whyte, D.D. New York: Fleming H. Revell Co. \$1.50.

⁸ THE MINISTER AS PROPHET. By Charles Edward Jefferson. New York: Thomas Y. Crowell & Co. 90 cents.

Dr. Adler is certainly independent and not very orthodox, either as a Hebrew or as a Christian. But there can be no question either of the ability or the sincerity of the leader of the Society for Ethical Culture, and his sermon-essays,⁹ in which he shows how one is led through righteousness to God and how religion is the necessary complement of a life of duty, are fitted to do great good. Perhaps there is no greater need of the time than that morals should come to their own in prayer and sermon and in the life of Christian Churches, whether Anglican, or Presbyterian, or Independent.

Rome in Colors

So many volumes, good, bad and indifferent, have been made about Rome that the announcement of a new book on that time-worn subject does not at once arouse great expectations. But one has only to glance at the first two or three illustrations in this newest work on the ancient capital of the world* to settle into his chair for an hour of rare enjoyment over the pictures alone. There are seventy of them, excellent colortype plates, made by the Hentschel process, from paintings by Alberto Pisa—paintings which must be beautiful indeed, for even in these reproductions the artist succeeds wondrously well in conveying something of "the grandeur that was Rome," and yet more of the haunting dream of the Eternal City as it is to-day. "Color," says Ruskin, "is meant for the perpetual comfort and delight of the human heart." And in richness and refulgence of color no city in the world surpasses Rome. Something of its pure brightness, its splendid sky, its pulsating air, has been caught by this painter-lover in his sketches of ruined temples, arches, columns, uprearing their yellowed and weatherbeaten marbles from worn old pavements or new growth of brilliant flowers; his glimpses of the silent Campagna; of the Colosseum, on a spring day, at sunset and in storm; of medieval churches and within historic gardens and cloisters. We should like to

⁹ THE RELIGION OF DUTY. By Felix Adler. New York: McClure, Phillips & Co. \$1.20.

* ROME. Painted by Alberto Pisa. Text by M. A. R. Tucker and Hope Malleon. London: Adam and Charles Black. Imported by the Macmillan Company, New York. \$6.00.

buy the gorgeous flowers his buxom peasant girls so temptingly proffer, and with gift of coin and friendly greeting gladden the heart of his Little Gleaner in the Campagna.

The book exists primarily for its pictures, and they are its abundant justification. They were well worth making into a handsome volume. Yet the text is almost as fascinating as the illustrations. In a prefatory note the authors point out that the task of avoiding hackneyed ground was not an easy one, but that they have attempted to present some aspects of Rome as they have themselves seen it, and they have drawn on their long acquaintance with the city and, above all, with its inhabitants of the old school and the new. Discoursing of the city's history, briefly; of Roman building and decoration; of the Catacombs; of Roman regions and guilds; of the Campagna; of the manner of living of the inhabitants; of Roman princely families; of Roman religion and Roman cardinals, and of "The Roman Question"—before and since 1870—they give a wealth of information as interesting in itself as it is entertainingly told.

Southern Writers. Edited by W. P. Trent. New York: The Macmillan Co.

This volume is "designed primarily for use in schools and college classes in the South." It contains biographical sketches of 86 Southern writers, with selections from their works, and covers the entire period of Southern literature. It is divided into three parts. The first deals with the "literature of the Colonies and the Revolution," which consisted mainly of records taken from the diaries and letters of Colonial gentlemen. The second part is devoted to the "literature of the Old South," which covers the period from the inauguration of Washington to the assassination of Lincoln, and much of it consists of speeches made by distinguished Southern statesmen. The author thinks the lack of literary activity at this time "was due to no mental or spiritual defects on the part of the Southern people, but to conditions inseparable from a rural aristocratic system." But this is really begging the question. The people did not have these "conditions" thrust upon them. They made them and

fostered them because they had the aristocratic rather than the artistic temperament. They preferred being the kind of men they were to being any kind of authors. The third part has to do with the "literature of the New South." After the war the Southern people come down to stern reality for the first time in the history of their civilization. Now reality is the last thing Southern people are born fitted for. Their traditions, minds and spirits are against such a disillusionment. This is proved by the fact that they boldly created and maintained a romantic, almost medieval, civilization in the nineteenth century, and they would be living in it yet if the odds had not been against them during the Civil War. But after a fashion they are submitting to the progressive inevitable, and when reconstruction was over their literary renaissance began. Lanier, Russell, Page, Harris, Miss Murfree gave the South a prestige in the world of literary art which she never had before except through the writings of Edgar Allan Poe and perhaps Henry Timrod. But Professor Trent thinks that writers of fiction in the South during the past ten years have not realized the high promise of those pioneer novelists of the "New South," and many will agree with him in the opinion. Like every book of its class, this volume will meet censure both for what it includes and for what it excludes, but on the whole it is a praiseworthy effort, and in the main a successful effort, to redeem the South from the charge of actual literary sterility.

The National Administration of the United States of America. By John A. Fairlie, Ph.D. New York: The Macmillan Co. \$2.50.

The Government of the United States is fast coming to have a greater amount of administrative work than any other Government in the world. It is quite time therefore that we had a comprehensive view of its intricate and extended operations. This Dr. Fairlie has given us in a book that is at the same time full, readable and authoritative. From the administrative powers of the President to the work of the Smithsonian Institution, we are permitted to see the Government in action and to get expert

opinion as to the efficiency of its present activity, as well as suggestions for its improvement. Everywhere we are given a careful scholarly summary of the best thought of the wisest men who have given the subject their consideration. The historical evolution of each administrative department is also given with admirable accuracy. Every chapter is preceded by a list of the best works upon the subject under treatment. At the close of the book is a full list of the cases in which the courts have decided the powers and limitations of our national administrative system. The book has been written, in fact, from the primary official records and elaborated by the work of investigators in special fields. The arrangement of the book is simple. After the President, Dr. Fairlie treats of the Senate and House in their administrative work. The Cabinet as a whole follows, and then the State Department, Treasury, War, Navy and Justice, etc. Since the problems of administration are the great problems of the present an ordered presentation of the national system may serve as a model for State and local administration, which, as the author suggests, is now a disorganized class. The work must be of use to all who wish accurate knowledge of the administrative work of our Government and, as the reviewer has had occasion to know, will be welcomed by many officers of our Government who have long hoped for such a work done in a scholarly manner.

The Principles of Economics. By Frank A. Fetter. New York: The Century Co. \$2.00.

There are evidently more things in the economic world than are dreamt of in Dr. Fetter's philosophy. The amiable optimism with which he regards the workings of the present system of industry takes small account of the injury and suffering coincident with it. That some 12,000 persons are killed and 138,000 wounded on the railroads and trolleys yearly; that during 1900, 6,468,964 wage-earners were partially unemployed, and 2,069,546 male wage-earners were unemployed for from four to six months; that fraud and graft, including adultera-

tion of goods, are generally prevalent, are not so much as considered in his blissful account of the operations of modern industry. He partially disavows, it must be admitted, the consideration of what ought to be as a part of the work of the economist. "It is the first duty of the economist," he writes (p. 17), "not to preach what should be, but to understand things as they are." But on a later page he declares that "we must rise to the standpoint of the social philosopher and consider the more abiding effects of wealth"; and so in the fulfilment of this duty a very considerable part of the volume is given up to the justification of things as they are. Tho having acquaintance with the new, his philosophy is essentially of the old and reveals but few modifications due to an understanding of modern thought and modern conditions.

From the Garden of Hellas. By Lilla Cabot Perry. Boston: Houghton, Mifflin & Co. \$1.25.

The volume is made up of a fairly representative set of selections from the Greek Anthology, translated into English verse. The manner of execution and the general effect of the modern measures may be judged by the following epigram from Agathias, which the reader will recognize as the model of Ben Jonson's well-known "Drink to me only with thine eyes":

"I love not wine, but shouldst thou wish
That I its slave might be
Thou needst but to taste the cup,
Then hand it back to me.

"Wine that thy lips have lightly touched
The steadiest head would turn.
And yet from such sweet cup-bearer
The wine how could I spurn?

"For unto me that cup would bring
From thy dear lips a kiss,
And while I drank would softly tell
How it received such bliss."

Studies on Anglo-Saxon Institutions. By H. Munro Chadwick. Cambridge, England: The University Press. New York: The Macmillan Co. Pp. xiii, 422. \$2.50.

Mr. Chadwick's book is essentially the work of a specialist and it will appeal chiefly to students who are interested in

the minute details of Saxon civilization and government in England. Social rank in the pre-Norman period of England was largely determined by compensations and fines—by wergelds as they were called—which were paid by men who had broken the law or done injustice or wrong to another man. A wrong done to the king had to be condoned by a certain measure of compensation. For the same wrong done to an archbishop the compensation was less. It was again less for a bishop or an earl and tapered down in amount until it reached the ceorl, who stood at the bottom of the social scale so far as freemen were concerned. All these wergelds were according to a fixed scale, and it is with a view to making them understood that Mr. Chadwick has devoted five chapters of his book to the monetary system of England in Saxon times. The administrative system and the constitution of the National Council are dealt with in other chapters. These systems, as treated of by Mr. Chadwick, have a much more general interest for ordinary students of English history than the chapters on the wergelds and the monetary system. They have this wider interest because some of the institutions concerning the origin of which Mr. Chadwick writes with such care and with such detail have continued in some form down to the present time. In fact, a study of Mr. Chadwick's work reminds us how well England was organized for governmental, ecclesiastical and social purposes in Saxon times, and how much of this civilization has been permanently interwoven into the economy of local government in England as it exists to-day. To the specialists for whom Mr. Chadwick has written his "Studies on Anglo-Saxon Institutions" will be most serviceable, and it is from these students that appreciation for a painstaking contribution to the history of England in the pre-Norman period will assuredly come.

A New Era in Old Mexico. By G. B. Winton. Nashville, Tenn.; Dallas, Tex.: Smith & Lamar. \$1.00.

Dr. Winton was prominently connected for a number of years with the mission work of the Southern Methodist Church in Mexico, but at the last General Con-

ference, he was made editor of *The Christian Advocate*, which is the general organ of the church. The volume is an intelligent and suggestive appreciation of the country and the people and of the modern forces at work there, both in the Christian and industrial world, and which are creating the "new era."

The Hills of Freedom. By Joseph Sharts. New York: Doubleday, Page & Co. \$1.50.

The scene of this story is laid in a village on the south bank of the Ohio River, at the close of the Mexican War, and when the abolitionists were beginning to operate their "underground railroad" for the rescue of slaves. It is cast in the form of a comedy, in which the author caricatures irascible old age, love and youth with much clever wit. The publishers have been at some pains to make the book attractive and the illustrations by S. J. Dudley are as unique as they are suggestive.

Christianity as Taught by Christ. By H. S. Bradley, D.D. New York: Fleming H. Revell Co.

These sermons were delivered by a Southern preacher, in the very heart of the dogmatic South. They proclaim some of the most advanced views of the higher critics. They are astonishingly free from theological restraint or the earmarks of any creed, and yet the author has never been tried for heresy. On the contrary, he is the most popular preacher in his section, except with the watch dogs of its doctrines. Dr. Bradley is well equipped in scientific knowledge and religious scholarship to maintain his advanced position; and these sermons created more interest than any delivered in the South for many years because the author has succeeded in presenting the teachings of Jesus with a sort of secular sincerity. His style is not marked by any particular literary excellence. The sentences do not always lie down decorously upon the page, charged as they are with the informal vitality of a young man's mind and spirit who cares for the truth with a natural human heartiness, and who without the least shadow of irreverence is happily emancipated from purely theological conventions.

The Personal History of the Upper House.
By Kosmo Wilkinson. New York: E. P.
Dutton & Co. Pp. 352. \$3.00.

Mr. Kosmo Wilkinson's "The Personal History of the Upper House" brings to mind three other books dealing with the House of Lords and the aristocratic families of England, each written from a different point of view. These are Pike's "History of the House of Lords," which is the only complete history of the Upper Chamber in existence; Sanford's "The Great Governing Families of England," and Howard Evans's "Our Old Nobility," which treats of the governing families of England from a Radical standpoint and goes into detail as to the origin of many of the aristocratic families long represented in the House of Lords. Mr. Wilkinson's book comes nearest in style, tho not in point of view, to Evans's "Our Old Nobility." This book was written in the early eighties for serial publication in *The Echo*, then under the editorship of Passmore Edwards, the foremost exponent of Radicalism in the English daily press. There is no preface to Mr. Wilkinson's book, but the remarkably free style in which it is written suggests that it may have had an origin somewhat akin to that of "Our Old Nobility," and appeared in serial form in some English Conservative newspaper. Mr. Wilkinson is an admirer of the House of Lords, particularly of the House of Lords as it is constituted to-day; also of its policy since its great conflict with the House of Commons over the repeal of the paper duties in 1860. But there is no partisanship in his estimates and judgments of the men who have figured prominently in the history of the peerage since the reign of King John and of the men who have achieved fame or notoriety in the House of Lords since the Lords and Commons began to sit apart in 1483. He gives almost as much attention to the hoodlums and buffoons of the peerage as to the statesmen it has produced. He presents sprightly vignettes of the disreputable as well as of the reputable and the famous, and in writing of the disreputable he is so free in his style as to come very near the "Mainly About People" columns in some of the English halfpenny daily newspapers. On the other hand, there are some really master-

ly characterizations, especially, among those of later times, of Scott's Duke of Argyle, Chesterfield and the Earl Grey, who in 1832 carried the Reform Act and bore down the opposition of William IV and the Tory peers. Mr. Wilkinson has read widely for his work, but references to authorities are few and far between, and here and there he makes statements which seem to need the support of good authorities. "The Personal Story of the Upper House" is not put forward as a work on constitutional history. Mr. Wilkinson acknowledges his indebtedness to Mr. Pike and disclaims any intention of going over the ground covered by the "Constitutional History of the House of Lords." But notwithstanding this disclaimer Mr. Wilkinson weaves into his narrative a fair amount of constitutional party history, some of which is new and informing, and in particular he makes clear and popularly understood the relations which have come to exist between the Lords and the Commons and the attitude of each House toward the other.

The Morals of Marcus Ordeyne. By William J. Locke. New York: John Lane. \$1.50.

A succinct criticism of *The Morals of Marcus Ordeyne*, at first blush, would be that he hadn't any! But, at the end, he seems to have worked out a sort of morality through growing unselfishness and a genuine affection. The way in which certain conventions of British society strike a girl born and bred in a Turkish family has a vivacious verisimilitude.

The Way of the North. A Romance of the Days of Baranof. By Warren Cheney. New York: Doubleday, Page & Co. \$1.50.

Alaska is a comparatively new field for the novelist. We have had an Epic of the Dog in Alaska, but not so much about the human inhabitants. In "The Way of The North" we are carried back to the days of Russian dominion and the unlimited autocracy of the Fur Company. The story moves and lives for a good many pages, which lets us down with a greater shock when it stumbles into the foul morass of a situation which has swamped too many skalds of the

North. There is nothing in the nature of the man, no fatality in the circumstances about him, to prepare the reader for the fall of the priest. It is an unnecessary and obnoxious blot; and if it be a concession to a supposed taste for the salacious it is all the more a dishonorable blunder. There is no working out of a problem in life or character, no regenerating remorse, no growth of power through suffering; the incident is squalid and unclean as an Eskimo hut and spoils an otherwise fine and unusual book.

Literary Notes

EDITH WHARTON'S latest story, "The House of Mirth," of which Book I was completed in the June *Scribner's Magazine* and reviewed in THE INDEPENDENT three weeks ago, will not be published in book form until October.

....The twenty-fifth, or index, volume of "The Historians' History of the World," by Henry Smith Williams, LL.D., issued by the Outlook Company, has been finished and is now ready for delivery to subscribers.

....The astonishing growth and development of our great Northwest is neither appreciated nor understood in most of the United States, so the *World's Work* has done well to devote the greater part of the August number of that magazine to that region apropos of the Lewis and Clark Centennial. It is unnecessary to say that the photographic illustrations are numerous and beautiful.

....In picking out books to take into the country on a vacation one cannot go astray if he loads up with Macmillan's twenty-five-cent paper-bound novels. They are books that are still "alive." Some recent titles are Mrs. Humphry Ward's "History of David Grieve," "The Garden of a Commuter's Wife," H. G. Wells's "The Wheels of Chance," Robert Herrick's "The Real World," and Winston Churchill's "The Celebrity."

....A dainty and handy edition of Robert Louis Stevenson's works is being published by Scribner at \$1.00 in cloth and \$1.25 in limp leather. The type is good; the volumes convenient to hold in the hand as one lies in a hammock. An especial interest is given to this "Biographical Edition" by the introductions of Mrs. Stevenson, telling of the circumstances under which the stories and essays were written.

Pebbles

Redd: "How much does that chauffeur cost you a season?" *Greene*: "Repairs, fines or salary?"—*Yonkers Statesman*.

....JOURNALISTIC AMENITIES ON THE COAST.—"We regret to chronicle the sad fact that our esteemed, handsome, debonair friend, Mr. James A. Carey, the editor of the *Adjuster*, two weeks ago met with an accident that may cost him the permanent use of his right hand. A careful perusal of the editorials in the last edition of the *Adjuster* sustains the proof of his injury. The editorials were evidently written by Mr. Carey's accomplished feet."—*Pacific Underwriter*.

....Miss Frances Keller, of the Women's Municipal League, of New York, illustrated admirably at a recent dinner party a point which she wished to make in reply to a man who had said "women are vainer than men." "Of course," Miss Keller answered, "I admit that women are vain and men are not. There are a thousand proofs that this is so. Why, the necktie of the handsomest man in the room is even now up the back of his collar." There were six men present and each of them put his hand gently behind his neck.—*Philadelphia Ledger*.

....JACK LONDON AS A MUSICIAN.—An Eastern newspaper says that Jack London, on his last visit to New York, was introduced in a *café* to a musician. "I, too, am a musician in a small way," London said. "My musical talent was once the means of saving my life." "How was that?" the musician asked. "There was a great flood in our town in our boyhood," replied London. "When the water struck our house my father got on a bed and floated with the stream until he was rescued." "And you?" said the musician. "Well," said London, "I accompanied him on the piano."—*Wasp*.

....YOUNG YET.—The Rev. Dr. William Emerson, of Boston, son of Ralph Waldo Emerson, recently made a trip through the South, and one Sunday attended a meeting in a colored church. The preacher was a white man, however, a white man whose first name was George, and evidently a prime favorite with the colored brethren. When the service was over Dr. Emerson walked home behind two members of the congregation, and overheard this conversation: "Massa George am a mos' pow'ful preacher." "He am dat." "He's mos' pow'ful as Abraham Lincoln." "Huh! He's mo' pow'ful dan Lincoln." "He's mos' pow'ful as George Washin'ton." "Huh! He's mo' pow'ful dan Washin'ton." "Massa George ain't quite as pow'ful as God." "N-n-o, not quite. But he's a young man yit."—*Woman's Home Companion*.

Editorials

Reform Work in Philadelphia

So far as measures for the prosecution and punishment of the leaders of the ring are concerned, the reform movement in Philadelphia has been retarded, but with respect to other matters of great importance it is under no restraint and has lost none of its original force. Prosecution of the leaders of the ring upon criminal charges has been delayed and thus far prevented by the attitude of the District Attorney, who admits that for two years past he has been employed as counsel by the ring contractors and that he—the public prosecutor—was recently preparing to defend them in court against expected demands from the Mayor and the reform organizations for damages. The man has been closely associated in various ways with those whom the reformers are pursuing. He is now temporarily disabled by an accident, and the Mayor has deferred until after his recovery the application of a final test which shall show on which side of the dividing line he has decided to stand.

This delay encourages the ring and its friends. In the Councils there are signs of a reaction and of a renewal of the old opposition to the Mayor's policy. He ordered a suspension of ring contractors' work on the great filtration beds in order that the character of that work, believed to be grossly fraudulent, might be ascertained by experts of national reputation. He is met now by a demand that the work be speedily taken up again, because the city's water supply is in sore need of purification. That has been true for many years. But now certain State authorities have been publicly inspecting the sources of pollution. Dangerous and disgusting contamination is thus disclosed (as it has been many times in the last two decades) and this, of course, supports the plea for an immediate resumption of work under the ring contracts. Such are some of the obstacles which the reformers now encounter in some parts of their broad field of activity.

But they are not restrained from ex-

posing the almost incredible election frauds from which the ring's power has been derived, or from purifying the lists by means of which not less than 80,000 fraudulent votes have been cast for the ring's benefit. This is really the most important of the investigations which the Mayor and his allies have undertaken. There can be no enduring reform in Philadelphia until provision for honest elections is made. Dishonest elections, fraudulent lists of voters, the use of these lists by repeaters, the stuffing of ballot boxes and other crimes of a similar character have been the foundation of the entire structure of public robbery and municipal treason. Wisely do the reformers bend their energies to the purification and protection of the ballot box.

Under the rule of the ring every policeman was required to procure the registration of from 5 to 10 names (commonly fraudulent and fictitious) from his dwelling house, if he had one. Other municipal employees were expected to do as much. In addition every disorderly house, every man selling liquor without a license and every keeper of a cheap lodging house who gained something by violating the sanitary regulations, provided as many fraudulent registrations as were suggested by the officers to whom they looked for protection. Repeaters roamed about the city on election day. Sometimes they were imported from Washington, Baltimore and other cities. There was no limit to fraud, no restraint. In some election districts the election officers named had no existence, like a majority of the fictitious persons registered for voting under their supervision.

Directed a few weeks ago to report all fictitious and fraudulent registrations of which they had knowledge, the police brought in 31,817 names. The number should have been nearly three times as great. Some of these men had sought to obey their orders; others had been true to the ring, expecting probably that it would soon be restored to power. Reform organizations were making a

similar inquiry at the same time. In one ward they found 2,927 fictitious names where the police had found only 1,226. And so the policemen were ordered to go over the ground again. This second inquiry is not finished, but in five small election districts, where only 62 fraudulent registrations were reported at the end of the first one, the same investigators have now found 614!

There are ring men in Philadelphia who ought to be sent to the penitentiary. Large sums of stolen public money ought to be recovered from them by the city. But attempts to punish these scoundrels by prosecution should not be permitted to divert the attention of reformers from the more important work of making elections honest. For upon a foundation of fraud at the polls, as we have said, the whole foul superstructure of theft and protected vice and unpunished crime and legislative corruption has been supported.

These fraudulent elections have placed the leaders of the ring in office and kept them there; have demoralized the police and other municipal employees, making them the agents of thieves; have caused the official protection of crime and of such vice as has been found in the infamous dens of the White Slave traffic; have permitted the ring to rob the city by great contracts for public works; have enabled the ring to negotiate for such monstrous agreements as the gas lease; have sent rascally representatives to the State Legislature, there to do the ring's bidding concerning franchises for public service corporations and "ripper" bills designed to perpetuate the ring's power by tying the hands of any Mayor who should unexpectedly turn out to be honest.

Without enduring reform at the ballot box, reform in municipal administration can be only temporary and spasmodic; with it, permanent and thorough administrative reform can easily be had by a city where a majority of the voters want it.

But even when the votes are honestly cast and counted much may be lost if national questions and national party divisions are dragged in to affect elections which should relate exclusively to local and municipal issues. Reformers in

Philadelphia are even now contending against purely partisan influences, shrewdly invoked by a ring that was Republican in name and that was allied to the Republican organization of the State. To break the force of these influences the newspapers that have so effectively promoted reform are now continually urging their Republican readers to observe that the ring is denounced by so eminent and so representative a Republican as Secretary Root, and to accept these assertions of Secretary Bonaparte:

"When a man is in politics for what he can get out of it, he belongs to no party at all. His fraudulent professions of party loyalty are aggravations of his offense. There is no more reason for saddling the crimes of the Philadelphia gang upon the Republican party than there was for saddling the crimes of the Gorman-Rasin ring in Maryland, in the old days of boss rule, upon the Democratic party."

These appeals to the people lead us to infer that many worthy voters in Philadelphia have yet to learn that municipal administration is business and should not be a matter of partisan politics; that the question to be asked concerning a candidate for municipal office is whether he is honest and competent, and not whether he stands for a high protective tariff and insists upon keeping the Philippine Islands.

New Light on the Origin of the War

THE secret history of the origin of the Russo-Japanese war is being disclosed sooner than was expected, owing to the publication of many letters and official documents in the Russian journals for the purpose of clearing one and another prominent man of the responsibility of the gigantic blunder. Altogether there is revealed a disgusting mess of graft, favoritism and intrigue which makes it quite impossible to hold any longer to the theory that the leaders of Russian expansion in the Far East were moved by unselfish and patriotic, altho mistaken, motives.

The old rule of the French police service, "*Cherchez la femme*," becomes, when applied to international difficulties.

"Cherchez le financier." In this case the financier is Mr. Bezobrazov, who, according to *l'Européen*, is more than any other man responsible for this deluge of blood and the misery it will entail upon millions of his countrymen yet unborn.

We all knew that the spark that precipitated the war was the cutting of timber upon the Yalu River, in Northern Korea, by the Russians, and that the diplomatic negotiations for the purpose of bringing Russia and Japan to an agreement were delayed and rendered fruitless because all the notes exchanged had to be sent to Admiral Alexief, Viceroy of the Russian possessions in the Far East, for his consideration, but it was a mystery to the world why the Yalu timber was regarded as of so great importance to Russia that a war with Japan should be risked to secure it, and why the two nations could not have settled their differences through their representatives at St. Petersburg or at Tokyo without having to consult Admiral Alexief at every step.

It now appears that the withdrawal of the Russian troops from Southern Manchuria in the fall of 1902 was not a mere feint, but resulted from the determined efforts of Mr. Witte and other farseeing statesmen to induce at least the partial evacuation of Manchuria as the only means of preventing a disastrous war with Japan. In January, 1903, the Russian representatives in the three countries concerned—China, Korea and Japan—Mr. Lessar, Mr. Pavlov and Baron Rosen, met at St. Petersburg, and insisted upon the continuing of the evacuation in good faith. In this they were supported by Mr. Witte, Minister of Finance, and Count Lamsdorf, Minister of Foreign Affairs, but were opposed by General Kuropatkin, Minister of War, who, unfortunately for his future reputation as a general, gained his point.

Nevertheless in view of the insistence of Secretary Hay on keeping the door open, and the backing which England gave to Japan, it is probable that some compromise would have been ef-

fected with China if the busy Mr. Bezobrazov had not appeared upon the scene with his pockets full of concessions and prospectuses of companies for the exploitation of Manchuria. He had an abundance of money, and, what was more important in a bureaucracy, an apparently irresistible pull at St. Petersburg. He wanted to develop the oil region of Fuchun and to light Mukden by electricity, and to run trolley roads throughout the province. He interfered as one having authority in the management of the railroad, the army, the navy and foreign affairs. The conciliatory policy adopted by the Russians toward the Chinese authorities in Manchuria was, in his opinion, altogether wrong. Instead of being helped, they should be worried and bullied into a proper submissiveness. With this object he advised that the predatory bands of brigands known as Chun-guses should be encouraged rather than suppressed in order to make apparent the need of the strong arm of Russia to maintain order.

At first Admiral Alexief, then Governor of the province of Kwang-Tung, complained vigorously of the pernicious activity of Mr. Bezobrazov, but his good will was secured by the promise that the office of Viceroy should be created for him by which he would become the virtual ruler of all Manchuria and of Siberia east of Lake Baikal. Minister of the Interior Plehve obtained from the Czar, August 16th, 1903, a ukase appointing Alexief to this position and putting him in charge of all diplomatic relations with China, Japan and Korea.

In the meantime Mr. Bezobrazov had persuaded the powers behind, about and upon the throne of Russia that the best way to make the Asiatic possessions profitable was by means of a chartered company of extensive powers, such as Great Britain has found handy in expanding the empire in India and elsewhere. No treaties or conventions, he wrote, ought to be regarded as obstacles to Russia in the accomplishment of her historic mission in the Far East, and her progress in the direction

of her matured aspirations could not be checked by diplomatic technicalities. May 31st, 1903, he launched the Russian Forestry Company of the Far East, empowered to carry on lumbering, mining, fishing, hunting, transportation and other industries. The Emperor, Empress and Dowager Empress are said to have invested \$750,000 each in this enterprise, and many other persons in high places contributed funds or their "moral support." The rich forests of the Tumen and Yalu rivers on the Korean frontier were first attacked in spite of the protests of many Russian officials, including General Kuropatkin, who had just returned from Japan and understood the temper of the people there. For the protection of the agents of the company a special forestry guard was recruited by Lieutenant Colonel Madritov from the bands of Chunguses, which seems rather amusing when we think of the bitter accusations the Russians have made against the Japanese for their alleged employment of such irregular forces.

By this time the Japanese had come to the same opinion as Mr. Bezobrazov, that the advance of Russia could not be stopped by diplomatic means, and accordingly they resorted with startling suddenness to stronger measures. But it must not be supposed that all those who invested in the Yalu timber business lost their money through the failure of the enterprise. Provision was made to repay the members of the royal family from the funds raised for carrying on the war which their speculation has caused. It is reported that Emperor Nicholas declined to receive his share of this money, but the two Empresses do not seem to have had a like reluctance to putting their hands in the war chest.

And now the world is watching to see if Mr. Witte as a business man and Baron Rosen as a diplomat can repair some of the damage done to their country by this unholy alliance of commercial and aristocratic interests, against which two years ago they both vigorously protested.

Doing What You Want to Do

THE spirit of vacation time is freedom. But freedom is more difficult to attain because it is less dependent upon external conditions than we think. We sign a declaration of independence when we knock off work, but we soon find that we are not free, only independent. A freedman rarely becomes a free man. We have become so accustomed to the chains of care and responsibility that when our feet are unshackled we walk with the same cramped step. We escape from the prison of conventionality with relief and joy, only to creep back into the cell when night comes, because we feel safer and more comfortable there. We take to the woods to get away from newspapers and spend an hour reading the old one that came packed around the coffee pot. We go on an ocean voyage to isolate ourselves from the world and we keep the ether for a thousand miles trembling with Marconi waves. We flee to the wilderness with loud rejoicings to escape the tyranny of the Goddess Fashion and we straightway set up her shrine in the wilderness and bow before her image and force all those with us to obey her ritual.

That is why vacations are apt to be factitious. We are obliged to spend them in company with ourselves. We have had to do what we did not want to do for so long that we cannot do what we want to do when we have a chance. We are turned loose in the paddock, but we do not kick up our heels. Our drill sergeant orders us to break ranks, but that is the one command that we cannot obey; so we march away with the rest of the company at the same measured pace, keeping touch with our elbows on each side. Our drill masters of fashion or finance have made us into uniform automata. Any drops of red rebel blood that may have been in our veins have long ago become etiolated. The average human being is endowed with only a little originality at birth and that is soon quenched. Most of us act like those interesting little playthings of the psychological laboratory, pithed frogs. A pithed frog looks like an ordinary frog and behaves with perfect froggishness in whatever situation he may be placed,

but he never does anything when he is left alone; he has lost the power of initiative. Now, as H. G. Wells has pointed out, society acts upon the individual somewhat as the psychologist on the frog, altho the operation in the case of human beings is more gradual and painful. But the result is much the same. People do their duty in a regular and orderly manner in obedience to social conventions and it is only in vacation time when they are set free to do whatever they want to do that they betray the fact that they are pithed, by not wanting to do anything new.

The chief object of vacations is to give one's embryonic or atrophied powers of spontaneous movement a chance to work, to give the individual a chance to develop his individuality. It is an opportunity for one to recover his normal sphericity of nature. A soap bubble is a perfect sphere because it is expanded by pressure from the inside. External influences alone, the long continuance of social pressure, will produce an apparently well rounded individuality, but on close examination it will be seen to be full of dents like a bowl of hammered brass; quite unlike the natural symmetry of character produced by growth under the control of some internal principle. The vacation season is a good time to work out the dents left in us by the elbows of our fellow men. In the city we are so crowded together that we become dodecahedrons, like oranges packed in a box. It is a test of our resiliency to see if we come back from vacation more symmetrical in character and intellect than when we dropped out of the crowd and with an expanded individuality.

Vacation gives us a chance to take out our idiosyncrasies and give them an airing. We can, or, rather, we may, sprout freakish ideas. But it would take something stronger than radium to start in most of us the spontaneous generation of thought. We follow the crowd because we are natural born followers. "Follow my lead" is one of childhood's games that we play all our lives. If we walk across a pasture lot we follow a path, modestly deferring our own judgment as to route to that of the first cow who meandered in that direction. Hampered

as we are by limited money and time, we think how easily we could spend a million dollars, but when we are called upon to tell what we would do with it we mention a few things quickly and then our imagination halts. So when we are given our thirty days of comparative liberty we find after a week that we cannot think of anything new to do. We cannot please ourselves any more than we can please other folks. And even to do nothing requires a concentration of mind and an intensity of purpose that only a favored few possess.

The Great Cities

THERE are now in the world nine cities of more than one million inhabitants each. Three of these—namely, New York, Chicago and Philadelphia—are cities of that new world which was only dreamed of five hundred years ago and was undreamed of when Thebes, Babylon and Nineveh vaunted themselves as important centers of civilization. No other nation than the United States has more than one of these big towns, the others being London, Paris, Berlin, Vienna, Canton and Tokyo.

The new State census will probably show a population in New York City of close upon four million inhabitants. The unrevised figure is 3,987,696. This is a gain of over one hundred thousand a year since 1900, when the first enumeration after the consolidation of New York and Brooklyn showed a population in Greater New York of 3,437,000. London has a population at present of 4,536,641. New York is thus a close second, and in all probability will overtake and pass London within another generation. The contention that this is improbable because the metropolitan area of London includes 6,581,372 inhabitants is unfounded, because we have to remember that the actual urban district of New York City includes Jersey City, Hoboken, Newark, Elizabeth, Paterson and Yonkers, which are not comprehended in the municipal corporation of New York City.

For ten years past the opinion has been gaining ground that the rapid growth of great cities in the nineteenth

century will not continue throughout the twentieth. The new developments already achieved and to be expected in the utilization of electricity are undoubtedly to make life relatively comfortable in the country and in the suburban villages. The trolley car and the telephone wonderfully extend the area within which the man whose business is in the city may choose his residence. Electricity is increasing also the possibility of conducting manufacturing operations in relatively isolated spots. We shall not see a return to the busy industrial life of small river valleys that were well populated before the Civil War; but old dams are being rebuilt, and the electricity generated by water power is being conveyed to manufacturing towns intermediate in size between the industrial hamlet of earlier days and the large city. In such towns business often can be done to great advantage, now that the long distance telephone enables the manager to be in communication at a moment's notice with any of the great trade centers.

Notwithstanding all these facts, we are unable to share the "anticipation" of Mr. H. G. Wells, that suburbanism will probably by a natural population movement succeed urban congestion. We are much more likely to see a continuing congestion supplemented by suburbanism. In other words, we are likely to see the growth of cities enormously larger than any which has yet existed. There will always be a balance of advantages and disadvantages determining the spontaneous distribution of a population between the congested areas and the relatively open suburban spaces. City workers live out of town when the cost of going back and forth, including railway fare and loss of time, is less than the difference between urban and suburban rents. Every improvement in transportation carries the suburban area farther afield, but at the same time it brings new business to the center.

Inasmuch as the housing problem is, all in all, the most serious one that confronts civilization, because tenement house life as we know it in New York City to-day is practically destructive of home-making possibilities, this probability that the big cities will continue to grow bigger has its discouraging aspect.

It is not necessary, however, to be pessimistic. The spontaneous development of urban existence cannot be depended upon to improve sanitary and moral conditions; but they can be improved by human intelligence taking practical expression in a sound public policy.

One way has been found, and one way only, to diminish congestion and to reduce the tenement area. Population can by law be driven out of the most congested districts into less peopled regions. Most of the great cities of England have tried this plan; Paris has tried it; New York, in a small way, has tried it, and it always works well. The actual device employed is a simple one, and it admits of almost indefinite extension. It consists in razing the worst tenement house blocks and devoting the ground to public uses, such as new or wider thoroughfares, or converting it into parks or playgrounds. This has been done in New York City in the destruction of Mulberry Bend, now a public park, and in the opening of the Stanton Street playground.

In this policy lies the chief hope of making the great cities fit for human habitation as they grow to dimensions hitherto unimagined. The actual centers of these vast aggregations of humanity will be built up with towerlike business structures. The zone immediately surrounding the business center if left to develop without wise municipal direction would become an unspeakably unsanitary and immoral area, compactly built up with shops, small manufacturing establishments and tenement houses. It is this zone, always widening, that must be watched and remorselessly controlled, a larger and larger part of it being converted from decade to decade into open spaces. Forced into a far roomier zone beyond, the actual population can find there conditions where life can be made not only clean and tolerable, but in all ways excellent.

Overeating

PEOPLE always listen during hot weather with more equanimity to charges of overeating so that the recent prominence of the subject is at least timely. At the annual meeting of the American Medical Association,

held in Portland, about the middle of July, one of the morning sessions was occupied almost entirely with a discussion of the origin of the various digestive ills to which our American people are so liable, and a definite expression as to the causation of these ailments, by prominent physicians from all over the country. There was practically universal agreement that the source of most of the ills to which the American stomach is so liable is to be found in overeating, and especially in the overconsumption of what is known as proteid material. The proteids comprise the heavier portion of the dietary and include such articles as meat, eggs, cheese, peas and beans and the like. These are the most expensive portions of the diet, and it was pointed out that in other countries where economy in the matter of food is a more serious question than it is with us, much less of these materials is consumed as a rule.

Of course, it has often been said that as a nation we overeat. It is only in recent years, however, that the persuasion as to overconsumption of food has been justified by scientific observation, which indicate just why and in what manner overeating is serious. The work of two investigators especially was recalled to attention in the meeting of the Medical Section of the American Medical Association, and the extreme significance of their results emphasized. Professor Chittenden, of Yale University, in a book which was recently reviewed in *THE INDEPENDENT* on the "Physiological Economy of Nutrition," shows by experimental observation on three different series of individuals, hardworkers, those moderately occupied and those living sedentary lives, that scarcely more than one-half as much proteid material is needed in order to maintain the body weight and the equilibrium of nutrition than these people had been accustomed to use during the time preceding the observation. Folin, in the *Journal of Physiology*, in a series of articles at the beginning of the present year came to the same conclusion from the standpoint of physiological chemistry. Both

these observers pointed out that proteid material is needed by human beings only for the purpose of building up tissues. It is never needed as an energy producer. The fats and the sugars represent the energy producers. If more proteid material is consumed than is needed, it is simply excreted, but before excretion it exists in the circulation for some time as irritant material and then throws a lot of needless work on the excretory organs in getting rid of it.

One feature of the overeating problem was particularly emphasized. It was pointed out that when persons eat slowly there is much less tendency to overeat. If the food is brought thoroughly in contact with the palate and the various taste organs on the tongue during the course of mastication, then the appetite is satisfied with much less than when the food is bolted. This is true in general for all kinds of food, and has been experienced by every one with regard to the sugars and fats, but is also eminently true for meats and cognate materials, only here the less amount needed makes the possibility of overconsumption much easier. Americans are well known to be a nation of fast eaters, and especially to have the habit of washing down their improperly masticated food with coffee, ice water and other unsuitable liquids. Hence, the accusation of insufficient mastication has a special significance and was emphasized by American physicians from all over the country.

Very few people realize how inadequate is their process of mastication under ordinary circumstances unless this is actually demonstrated to them. Physicians who have to treat cases of stomach trouble and are under the necessity of using a stomach tube not infrequently find that one of the best effects of this method of investigation and treatment is the actual demonstration to the patient of what large lumps of material are swallowed without having been masticated. Pieces of potato that sometimes evidently have been entirely untouched by the teeth are found in the stomach contents and

block up the stomach tube, making the evacuation of the stomach contents very difficult. This same thing is true for most forms of food. Unfortunately for this state of affairs the human stomach was not meant to crush materials in order to prepare them for digestion. The gizzard of the birds is a thick muscle, the action of which, helped by the pebbles, which birds instinctively swallow, serves to replace other mastication apparatus. Notwithstanding the fact that during the past month, as for centuries before, many a city boy has been sent by his country cousins hunting for hen's teeth, none of them have been found. The gizzard effectually supplies for the absent teeth. In human beings, however, teeth are a triumphant gift of provident mother nature, and the stomach is only a thin walled receptacle for food, with just muscular force enough in it to move the gastric contents on to the intestines, but without any active crushing ability.

The result is that when unmasticated food reaches the stomach it fails to pass out properly, and as a consequence delay of the gastric contents leads to dilatation of the gastric walls. Another and even more serious accident sometimes occurs. The pylorus of the stomach, the gate through which food passes to the intestine, is composed of a rather strong ring of muscular fibres. When larger pieces of material approach this ring they are usually refused exit. Occasionally, however, irritated by the presence of such unusual lumps, the pylorus attempts to make up for the lack of mastication, and during the egress of such material helps to crush it. After a time this exercise of an unusual function leads to overgrowth of the muscular fibres of the pylorus, and as a consequence, the opening from the stomach into the intestines becomes so tightly shut that ordinary liquid material does not readily pass through and the consequence is, for another and more serious reason now, delay the stomach contents with consequent dilatation of the stomach walls.

It will thus be seen that from two

different standpoints mastication is the most important and the most neglected process in eating. There are some further considerations, however, that serve to emphasize this importance. It is now thoroughly recognized that the stomach itself is by no means the important digestive organ that it used to be considered. It is mainly a receptacle for food material which helps man to store away sufficient food at one time, to enable him to pass a considerable period, some five hours, at least, before another meal will be required. It used to be thought that most of the process of the preparation of the food for absorption was accomplished in the stomach. This is now known not to be true. The stomach has been completely removed from a number of patients for cancer and other serious conditions, and such patients have proceeded to gain in weight and strength, accomplishing the digestion of food without any serious drawback. It is necessary that they take food in smaller quantities and at more frequent intervals, but nature even compensated for this, by bringing about an enlargement of the upper portion of the intestine, which to some extent, at least, supplied the place of the absent stomach.

It will thus be seen that if the stomach only passes on the food material conveyed to it the process of digestion will be very well carried out in the intestines. At the present time it is well known that not a few persons, owing to abuses of gastric digestion, have no proper secretion of gastric juice, and that none of their digestion is accomplished in this hitherto supposedly so important organ. Such persons are never in as good health as normal individuals, but usually suffer few digestive symptoms. As a matter of fact, if the stomach motility is unimpaired—that is, if its ability to receive food and pass it on to the intestines without delay be retained—then digestive disturbances are rare. The two elements which are the most frequent causes of disturbance of stomach motility are overeating and insufficient mastication. Both of these make calls on the mus-

cular walls of the stomach that they are unable to fulfill. The two ills form a vicious circle. People overeat, because they do not masticate enough, and so do not properly taste the food which they are consuming. They overeat of proteid material because this is not required in near such quantities as has hitherto been considered, and requires careful mastication in order to make its taste felt sufficiently to satisfy appetite. The cure for stomach ills then is not the taking of drugs and ferments for gastric stimulation, but the accomplishment of the eating process with the care and completeness which so important an element of animal life requires. But then people do not want advice as to their bad habits, but something that will enable them to continue in them with impunity.

The Help Problem

THE help problem will soon be upon the American people. The Kansas corn farmers and the Dakota wheat growers are calling loudly for assistance. The harvest is certain to be upon them without power to gather it. The outlook is that we shall repeat the history of 1903 and 1904. It is estimated that in the former of these years at least one-sixth of the whole income of the agricultural States was lost. Where the crops were gathered at all they were gathered hastily and by such uneducated hands that a great deal went to waste. Thousands of bushels of corn were never harvested and thousands of bushels of wheat rotted in the fields. Later in the season large acreages of potatoes remained undug until winter, and of the enormous crop of apples the freeze of November took many an orchard before it had been touched by the pickers. At the time this was not so much regretted, as prices were very low; but in the spring the price of apples in New York City ranged from three dollars and a half to six dollars per barrel, while potatoes were selling at one dollar to one dollar and a half per bushel. Again in 1904 the harvests suffered enormous loss from lack of help to gather them in the field and to place them properly in storage. Altho wages were high,

higher than in the cities, help could not be obtained on the farms at any price. Every effort was put forth to induce men and boys to leave our crowded streets, where they had little or no work at all, for the open country and good wages. A contractor with a road to build or canal to dig could easily get hundreds of men in gangs and for less remuneration than they would get on a farm. This herded element is not wanted in the city; there is scant work for it there at all times and there is no adequate support. Only the politician is glad to see the tenement house fat and overflowing.

So serious was the condition in 1904 that there was a systematic attempt in the Western States to press all tramps into service. This was done sometimes by arresting them and sentencing them to work in the harvest fields—a procedure not likely to add largely of this element to our laboring class in the future, for these fellows will give a wide berth to the harvesting States. We are now facing the same condition of affairs, and from some of the States it seems likely to be a more serious problem than ever before. Farmers have got the job and can furnish summer work for every idler in our cities. How are we going to break up the herds and get the hands where they are wanted? Of our newer immigrants only about three per cent. can be coaxed away into the class of farm help, excepting only those agricultural people who come to this country to form colonies, or settlements rather, in the group form. There are large sections in Wisconsin and Michigan which take up the Hollanders and the Swedes, and the same distribution is made of Danes, Norwegians and Welsh.

Our problem is greatly accentuated by the rapid development of the Southern States. Since 1860 the valuation of Southern products has increased two hundred and fifty per cent., and the negro is no longer adequate to the demand for help. In 1903 Southern mills used over 2,000,000 bales of cotton, but eight years before that they manufactured only about 862,000 bales. The Gulf States have forged to the front as fruit States, while the new citranges, created by the Agricultural Department at Washington, will extend the orange orchards half way to

the Ohio River. A large share of the old whites prove unable to adapt themselves to rapid progress, but there is an increment of the people fully capable of keeping pace with the times. Meanwhile there is less black labor to be had than at the close of the Civil War, and this supply is considerably decreased by drafting the negro into the Northern States. Two and a half million of whites also have gone to the North since the Civil War, while in return only about one million of Northerners have turned Southward. The tide now is the other way, and with enormous exploitation of possible Southern products the cry for help is fully as great as in the West and North. Every Southern State has an immigration bureau and there has been a good deal of successful effort to secure the better class of this influx from Europe—Germans and Poles preferring the Carolinas, while Italians and Japanese are becoming the fruit growers and rice farmers of the Southwest. There are 30,000 Italians in Louisiana and altogether 100,000 Italian farm laborers in the Mississippi Valley. Colonies of Scandinavians are being established in Alabama. The Japanese Government has an agent in Florida with a colony of Japanese agricultural students, and another in Texas. On the whole there is a better prospect ahead for a supply of help in the Southern States than in the North and West.

To the solution of this problem of help—that is, mutual co-operation—we must set our economists and our schools; may we say also our politicians? At one of our recent college commencements the President said:

"It will take very earnest work and very intelligent on our part to root the prejudice against hand labor out of our schools and out of the higher strata of our social life altogether. Industrial education must be met half way by those who are engaged in classical teaching, and our colleges must recognize the great fact that God made the hands as well as the head. Indeed, the one most important need just now is the exaltation of hand labor."

There certainly is something wrong in a social and educational system which compels us to let a large share of our annual produce, every pound of which is needed for the maintenance of the growing population of the world, go to waste.

We must learn not only to produce more but to waste less. It seems the depth of folly to apply labor and brain to the creation of that which we can neither harvest nor store. So far as the solution of this problem rests upon a more enlightened view of toil and the glorification of the hands our schools should be allied positively with the industrialists.

General Booth has probably the most experience of any living man in handling the herded crowd. He tells us that it is impossible to break up the congested masses into individuals. He undertakes to move not men, but families. The family, in his judgment, constitutes the social unit with which we have to deal. The farmer must readjust himself so as to hire families. Looked at any way it is a complex problem, as much of it possibly hanging upon education as upon instinct. Looking over a half dozen lists of college graduates recently and their chosen employments, we found barely one who had deliberately selected land tillage. The choice was nearly as mischievous in its relation to nearly all other producing industries. The percentage headed toward the professions is decreasing from year to year, but there are more who are going into "business"—whatever that may be—probably mercantile employments.

The shortage will, however, continue to be a serious factor so long as the Southern States keep up their present pace of development. Nor will the West and Northwest find relief on the present lines of social economy. Our immigrants must be persuaded to shun the cities, where they are not needed, and go into the country, where there is room, land and compensative labor for every one. It is a cheerful item of daily news that the Kansas farmers have secured a large number of boys from our colleges to spend their summer vacations in the wheat and corn fields. These boys with athletic muscles and quickened wits proved last year to be the best help obtainable.

Not the least of the reforms which have followed the uprising of the people of Philadelphia against the ring in that city has been the transformation of the municipal Civil

Merit in Philadelphia's
Civil Service

Service Board, which had been merely a ring agency, in the operation of which "pull" was substituted for merit. An appointment made last week shows how complete the transformation is. The office of Chief of the Bureau of Highways had been made vacant by a removal, but it was held temporarily by a trustworthy man whom the Mayor had selected. Notice was given in the press that a civil service examination for the place would be held. Working in the Navy Yard at day wages was a structural engineer named Hunter, who had been in the city only two years. He was urged by his wife to take the examination. At first he declined, saying that he had no political influence and was unknown. At last, however, he consented to make the experiment. His family physician and a neighbor signed his application. At the close of the examination it appeared that only one applicant had passed, and this was Hunter. Even the Mayor's friend, to whom he had given a temporary appointment, which he desired to make a permanent one, had failed. But who was Hunter? Neither the Mayor nor any other person connected with the city Government had ever heard of him. Inquiries were made, and after several conferences with this man from the Navy Yard the Mayor appointed him to the office, which carries a salary of \$4,000 a year. The public does not yet know whether Hunter is a Republican or a Democrat. No boss or ward leader had ever heard of him. This case appears to be an excellent exemplification of the true principles of civil service reform. It also furnishes proof of Mayor Weaver's sincerity and of the fairness of the officer whom he recently placed at the head of the Civil Service Board.

Federal Authority at New Orleans

Measures for controlling the epidemic of yellow fever in New Orleans are now to be taken by the Federal Government, at the request of the authorities of the city and the State. This transfer of management should, and probably will, put an end to the absurd little war between Louisiana and Mississippi in the lakes and sounds north of the city, and New Orleans will

have all the assistance and protection that can be given by the trained surgeons of the Marine Hospital Service. But they should have been placed in charge when the first case of the fever was discovered. New Orleans, with its innumerable cisterns and other breeding places for mosquitoes, its lack of sanitary drainage, and its intimate commercial relations with infected ports, invites an epidemic of this fever every year. When an epidemic appears there, the resulting injury is by no means exclusively local. Adjoining States and the entire Gulf coast are in danger, and business throughout the South is affected. Therefore the authority of the Federal Government should continually be exercised to exclude yellow fever at that port, as well as at other ports on the Southern coast line, and to suppress it by scientific treatment after it has been admitted. There is ample warrant for such action in the Federal Quarantine law of 1893, which says that whenever State or municipal authorities shall fail or refuse to enforce quarantine rules and regulations promulgated by the Secretary of the Treasury, "the President shall execute and enforce the same and adopt such measures as in his judgment shall be necessary to prevent the introduction or spread of such diseases." Every Southern port exposed to yellow fever infection should be guarded by national authority. If the first cases at New Orleans had been under the unquestioned supervision of Marine Hospital sanitarians and physicians, many lives would have been saved, and an epidemic might have been prevented.

Fifteen Thousand Miles to Hear Scientific Lectures

American scientists have always been envious of their British brethren because they could attend their scientific meetings with so little expenditure of time and money, and the undeniable superiority of the British Association for the Advancement of Science over the American Association has been often ascribed to this advantage. This year, however, the Association will endeavor to prove that the interest of their meetings is not de-

pendent upon their being held on the tight little island, for it has embarked upon the longest scientific excursion ever undertaken. The Association meeting will be held in South Africa, and about 400 members and guests have left Southampton for a voyage of 6,660 miles to Cape Town, where the first part of the session will be held. After a few days they will adjourn to Johannesburg, 800 miles away, where the rest of the papers will be read. At the close of the meeting a trip by rail of some 600 miles further into the interior of Africa will be made to see the greatest falls in the world, the Victoria Falls on the Zambesi River, which only a few years ago were altogether inaccessible to the ordinary traveler. The peripatetic philosophers will have their lectures given under peculiarly favorable circumstances. At Kimberley Professor William Crookes will lecture on diamonds; at Johannesburg the metallurgy of gold will be the topic; malaria, the sleeping sickness and the rinderpest will be discussed in the regions devastated by these diseases, and papers on the Kaffirs, Bushmen and Hottentots will be illustrated by the natives themselves. Now that the British have set us such an example of imperialistic science it will be in order for some one to nominate Manila as the next meeting place of the American Association for the Advancement of Science.

**Package
Bread**

Now that we get meat, vegetables and fruits sterilized in cans and jars, and milk is kept clean and pure, and the water supply of our cities is carefully watched, it is time to turn our attention to the practicability of getting clean bread. When one has seen bread carted through the streets uncovered and carried in the arms of a dirty driver into the restaurant he is inclined to go to some other eating place which is probably just as bad. The man who put up biscuits wrapped in waxed paper in a sealed package made a great fortune, and we hope the same reward will go to the baker who first puts upon the market bread that is so protected as to be secure from contamination by careless handling.

Bread, cake and even pies can now be made by machinery without the touch of hands in any part of the process, and it would be easy to protect the food the rest of the way to the mouth. Our leucocytes will get enough exercise in killing off what few million microbes will get into our food in spite of us, and we should take care not to give them any more to do than is necessary.

As part compensation for the murder of a German subject in Morocco last year the Kaiser has secured for a German firm the contract for building a stone pier in the harbor of Tangier. It is to be paid for by the Moroccan Government and will become the property of the Government at the end of three years—if nothing happens. This is in accordance with the Kaiser's well-known policy of utilizing such incidents for the extension of German commerce, and doubtless this is only the first installment of the compensation. For the murder of two German missionaries in 1897 he exacted from China the lease of the city and port of Kiao-chau for 99 years, together with an indefinite quantity of mining, railway and commercial privileges. Are dead missionaries more valuable than other men, or is human life cheaper in Europe than in Asia?

The yellow fever epidemic should result in the extension of the practice of cremation in the place of burial for infected cases. No one would wish that his death should be the cause of the death of others from the spreading of the disease from his body, perhaps years later. Authorities differ as to how long yellow fever germs buried in the ground maintain their virulence, but all are agreed that the fire of the crematory puts an end to them instantly and forever.

A provincial Governor who deliberately and publicly defies the national Government of the island and denounces the Supreme Court cannot reasonably hope to be elected President of Cuba. President Palma is more fortunate in being opposed by such a candidate than Cuba is in having so turbulent and reckless a man in high office.

Insurance

The Mutual Reserve Life Attacked

A REPORT made to State Superintendent Francis Higgins, covering an examination of the Mutual Reserve Life Insurance Company by Chief Examiner Isaac Vanderpoel, charges concealment of judgments against the company amounting to \$182,767. The report also alleges an exaggeration of the company's surplus of more than \$300,000 and a settled policy of procrastination in the payment of death claims. The real estate holdings of the Mutual Reserve are further held to have been overvalued. The report under consideration likewise shows in detail how insurance at one time amounting to \$1,923,000.73 finally yielded its beneficiaries \$906,656.74, there having been deducted \$293,655.30 on account of an indebtedness ascertained by the company to exist against the assured, with a further deduction of \$722,688.69 retained by the company for the various alleged violations of contract by the assured. Many of the beneficiaries have been subjected to much suffering and distress because of great delay on the company's part in the payment of its just debts to policyholders. The commission paid by the Mutual Reserve Fund for securing the membership of the Northwestern Life Assurance Company of Chicago in 1900, according to the Vanderpoel report, "never seems to have been received by it." The receiver's reports since the insurance was effected show no revenue from this source and the commission went to third parties. The names of the executive officers of the company and their salaries are reported as follows: Frederick A. Burnham, President, \$39,000; George D. Eldridge, Vice-President and Actuary, \$31,000; George Burnham, Jr., Second Vice-President, \$17,000; G. W. Harper, Treasurer, \$6,500; J. W. Bodin, Medical Director, \$6,500; William Porter, Comptroller, \$4,160; C. W. Camp, Secretary, \$3,900; R. L. Jones, Assistant Secretary, \$2,600; W. T. Eldridge, Assistant Secretary, \$2,560.

Upon the appearance of the report here briefly summarized the management of the Mutual Reserve Life Insurance

Company supplied all of its policyholders with a complete copy of the official report and accompanied it with its answer to the same. The company showed that the Department examination added to the assets \$82,360, and but \$7,862 to the liabilities, making the excess of gross assets over gross liabilities \$74,498 greater than the company's statement. The company's defense of its method of reporting unpaid judgments appears to be purely technical. The criticism of the company's real estate valuations in the Vanderpoel report is met by the statement in rebuttal that the Department reappraised the real estate and manifestly employed a far more rigid rule than in the examination by the same Department in 1902. At that time the company valued its real estate at \$707,660, while the Department's appraisal was \$758,471. The company valued the same real estate (all located in New York City) for the current year at \$714,998, while the Department's appraisal is now but \$683,571. An independent appraiser of the highest standing valued the same property on January 9th, 1905, at \$725,000. The company also takes exceedingly vigorous exception to the criticism of its settlement of claims. It calls attention to the fact that almost the entire amount delayed in payment belongs to the Assessment branch and says, quite pertinently it would seem, that had the company paid amounts not legally or justly due the members must have been called upon to pay additional assessments therefor. Denial is made that unnecessary delay has been permitted in the approval of assessment claims. No reply appears to that portion of the report dealing with the commission paid for the reinsurance of the Northwestern Life.

THE CONTINENTAL FIRE INSURANCE COMPANY, NEW YORK.

The Continental Fire Insurance Company, of which Henry Evans is President, has recently published its one hundred and fourth semi-annual statement. The results of the first six months of 1905 are shown in the following gains: Reserve for insurance in force, \$158,033; net surplus, \$763,663; gross assets, \$936,661. The total assets of the Continental are \$15,479,814, the cash capital \$1,000,000 and all other liabilities \$6,959,489, leaving a net surplus of \$7,520,325.

Financial

Large Orders from Japan

SINCE Japan began to look to New York for subscriptions to a considerable part of each of her loans, a portion of the money thus borrowed has been left here to pay for war supplies and railway equipment. Additional obligations for railway material have very recently been incurred under conditions which probably indicate Japan's determination to retain and extend her influence in Manchuria. Orders very quietly placed a short time ago for steel bridges, locomotives and cars require payments amounting to about \$5,000,000 to the manufacturers and more than \$2,000,000 for transportation across the continent. They call for 350 small steel bridges (\$500,000), 150 locomotives (\$2,225,000) and 2,000 steel cars (\$2,000,000), and the manufacturers are required to furnish them with the least possible delay. To save time, all this material is to be carried across the continent by rail, and it will be shipped from Tacoma and Seattle to Yokohama, there to be transferred to transports that will land it in Korea; for it is intended to be used for an extension of the new railroad (now completed from Fusan to Seoul) from the Korean capital into Manchuria. The present situation in that part of the world seems to give to these orders an interesting political significance. They may indicate Japan's policy of expansion.

American Capital in Nicaragua

THE recent establishment of a Consulate of the United States at Port Dietrick, Nicaragua, and the appointment of Edwin W. Trimmer to the office thus created, have directed attention to the extensive investments and operations of a powerful American syndicate in the northern part of the little republic. A company capitalized at \$20,000,000, and controlling a subsidiary railway corporation capitalized at \$10,000,000, has obtained from Nicaragua exclusive concessions for mining, lumbering, transportation by rail and steamship, telegraphing, etc., in a tract covering nearly one-third of Nicaragua's entire area, including the navigable river Coco, and

extending from one ocean to the other. It has already built up a port at the place where the new Consulate is situated, and this port takes its name from the company's Managing Director, James Dietrick. The leading members of the syndicate are capitalists prominently connected with the Standard Oil Company, the steel industry at Pittsburg and our railways. It is in the northern part of Nicaragua that the company's property lies, and the concessions are said to cover mineral deposits of great value. Such investments in Central America have naturally followed the beginning of canal work on the Isthmus by the United States. They probably foreshadow American control, political as well as industrial, of the entire country as far north as the Mexican boundary.

AFTER a trial of two or three years, the St. Paul, Alton and Burlington railroad companies have abandoned the age limit of 35 years for new employees.

....Large mills for the manufacture of structural steel are to be built on Staten Island by capitalists formerly associated with Mr. Carnegie.

....Exports of manufactures in the fiscal year ending with June exceeded those of any previous year by \$91,000,000. Their value was \$543,620,297, against \$452,445,629 in 1904, and only \$183,595,000 ten years ago, in 1895.

....There will be only seven mills on the dollar for the creditors of Mrs. Cassie L. Chadwick, the woman who borrowed large sums by asserting that she was the daughter of Mr. Carnegie. To meet \$2,000,000 of debts there is \$14,000 in assets.

....Dividends announced:

Union Pac. R. R., Preferred, \$2.00 per share, payable October 2d.

Union Pac. R. R., Common, \$2.50 per share, payable October 2d.

Niles-Bement-Pond Co., Common, 3 per cent., semi-annual, payable September 20th and December 20th; 1½ per cent., each date.

Niles-Bement-Pond Co., Preferred, quarterly, 1½ per cent., payable August 15th.

St. Louis & San Francisco R'way, 2d Preferred, 1 per cent., payable September 1st.

The Independent

VOL. LIX

NEW YORK, THURSDAY, AUGUST 17, 1905

No. 2959

Survey of the World

The President's Address to the Miners

Mr. Roosevelt
went to
Wilkes-Barre,

Pa., on the 10th, and there addressed a convention of the Catholic Total Abstinence Union. His audience of 60,000 was almost exclusively composed, however, of members of the anthracite miners' union, and he was introduced by the union's president, John Mitchell. After Cardinal Gibbons had spoken briefly of the elevation of labor during the last 2,000 years, of the opportunities of American workingmen to rise, and of the need of friendly relations between employer and employees, Mr. Mitchell recalled the history of the great strike, saying that largely as a result of Mr. Roosevelt's efforts the conditions of life and labor in the anthracite district had been materially improved, bitter antagonisms had passed away, and there was a bright prospect of permanent and honorable industrial peace. Mr. Roosevelt spoke at first of the great importance of the welfare of the wage-earner and the farmer. To promote this welfare, something could be done by legislation and by organization, so long as organization was managed with wisdom and integrity and a just regard for the rights of all; but the most influential factor was the character of the men themselves. Such a society as the Total Abstinence Union was a great help. He read parts of a letter sent to him by a Catholic priest, who urged him to support the cause of this society, and who also said:

"There is one discouraging feature of the wage scale among the workmen of this coun-

try. The higher the wages, the more money they spend in the saloons. The shorter the hours, the more they are inclined to absent themselves from home. An apparent disregard for family ties is growing among the poorer classes, which will eventually lead to a disregard for the blessings our country affords them. Hence, with an increase of wages a corresponding movement for better manhood, nobler citizenship, and truer Christianity should be set on foot."

The tendency to go wrong, Mr. Roosevelt said, must be offset by such agencies as this temperance society:

"I strive never to tell any one what I do not thoroughly believe, and I shall not say to you that to be honest, and temperate, and hard-working and thrifty will always bring success.

"The hand of the Lord is sometimes heavy upon the just as well as upon the unjust, and in the life of labor and effort which we must lead on this earth it is not always possible either by work, by wisdom, or by upright behavior to ward off disaster. But it is most emphatically true that the chance for leading a happy and prosperous life is immensely improved if only the man is decent, sober, industrious, and exercises foresight and judgment. Let him remember above all that the performance of duty is the first essential to right living, and that a good type of average family life is the cornerstone of national happiness and greatness. No man can be a good citizen, can deserve the respect of his fellows, unless first of all he is a good man in his own family, unless he does his duty faithfully by his wife and children.

"I strongly believe in trades unions wisely and justly handled, in which the rightful purpose to benefit those connected with them is not accompanied by a desire to do injustice or wrong to others. I believe in the duty of capitalist and wage-worker to try to seek one another out, to understand each the other's point of view, and to endeavor to show broad and kindly human sympathy one with the other."

He also believed, he continued, in the work of the great temperance societies and similar organizations, but most of all he believed in the efficacy of the man himself striving continually to increase his own self-respect by the way in which he did his duty to himself and to his neighbor.

The Monroe Doctrine

The President made a long address on the 11th at the Assembly grounds in Chautauqua, N. Y., to an audience of 10,000 persons, his subjects being the Monroe Doctrine and national supervision of corporations doing an interstate business. The Doctrine, he said, had been gaining recognition abroad because of our growing willingness to admit our own obligations under it to foreign peoples. It must be understood that under no circumstances would the United States use the Doctrine as a cloak for territorial aggression:

"Should any of our neighbors, no matter how turbulent, how disregardful of our rights, finally get into such a position that the utmost limits of our forbearance are reached, all the people south of us may rest assured that no action will ever be taken save what is absolutely demanded by our self-respect; that this action will not take the form of territorial aggrandizement on our part and that it will only be taken at all with the most extreme reluctance and not without having exhausted every effort to avert it."

We were not required by the Doctrine to interfere for the prevention of the just punishment of a nation south of us by a foreign Power, unless this punishment should take the form of territorial occupation. In the case of an attempted collection of foreign debts by force he preferred that this country should step in with some arrangement for the satisfaction of just obligations. It was our duty to help upward our weaker brothers. In his judgment, ethical influences were gradually becoming more powerful in the dealings of nations with each other. He described the condition of Santo Domingo when it appealed to us for help. "Society was on the verge of dissolution." At least one foreign Power was upon the point of applying force and was prevented from doing this only by our unofficial assurance that we would help

the republic. Speaking of the treaty still pending and of the temporary arrangement made, Mr. Roosevelt said that because of this arrangement all revolutionary movement had been completely discouraged, and that the 45 per cent. turned over to the insular Government by our agents exceeded that Government's receipts when it was taking the entire revenue. Thus the harassed people of Santo Domingo were freed from the curse of revolutionary disturbance and could turn their attention to industry. If the Senate should consent, our Government would examine all foreign claims against the republic "and see that none that are improper are paid." The only effective opposition to the treaty, he predicted, would come from "dishonest creditors, foreign and American, and professional revolutionists."

"We have already good reason to believe that some of the creditors who do not dare expose their claims to honest scrutiny are endeavoring to stir up sedition in the island, and are also endeavoring to stir up opposition to the treaty both in Santo Domingo and here, trusting that in one place or the other it may be possible to secure either the rejection of the treaty or else its amendment in such fashion as to be tantamount to rejection."

National Control of Great Corporations

Turning to the question of supervising and controlling great corporations, Mr. Roosevelt said that further legislation was needed. Unfortunately, some very wealthy corporations were exhausting every effort which could be suggested by the highest ability, or secured by the most lavish expenditure of money, to defeat the purpose of existing statutes. Such conduct was in every way perilous. He believed that it could be ascribed to only a relatively small portion of the rich men engaged in handling the largest corporations. Their attitude was harmful to the nation and to all rich men. Having exercised moderation with respect to the criminal provisions of the law, the Government was now convinced that in some cases, those of the beef packers, for example, leniency must no longer be shown. If the present law should prove to be inadequate or defective, defiance of it must lead to further legislation:

"This legislation may be more drastic than I would prefer. If so, it must be distinctly understood that it will be because of the stubborn determination of some of the great combinations in striving to prevent the enforcement of the law as it stands, by every device, legal and illegal. Very many of these men seem to think that the alternative is simply between submitting to the mild kind of governmental control we advocate and the absolute freedom to do whatever they think best. They are greatly in error. Either they will have to submit to reasonable supervision and regulation by the national authorities, or else they will ultimately have to submit to governmental action of a far more drastic type."

He should oppose much more severe legislation, but the course of some great corporations might cause the enactment of it. As these corporations by a resort to every technical expedient and to obstructive tactics had taxed to the utmost the machinery of the Department of Justice, Congress might well inquire whether other means of making the laws effective should not be sought. It might suffice at first to pass a bill empowering some branch of the Government to remedy abuses in connection with railway transportation. But in the end, and at a time not very far off, further action should be taken, probably in the direction of requiring corporations engaged in interstate business to take out licenses conditioned upon their obedience to the laws. There was danger that denunciation of abuses committed by certain rich corporations or men would be misinterpreted as an attack upon rich men generally. But in an immense majority of cases the straight-dealing man who by ingenuity and industry benefited himself must also benefit others. For the interest of all, the activity of those of exceptional business ability who so guided average men that their labor resulted in increased production, should be encouraged. But some of these exceptionally successful men used their energies not for the common good, but against it, thus not only wronging smaller and less able men—whether wageworkers or small producers—but also forcing other men of exceptional ability to do wrong under penalty of falling behind in the race. There was need of legislation to deal with such abuses. We should not try to go too fast, he said in conclusion, in procuring the desired

laws, and we ought always to proceed by evolution rather than by revolution. Our ideal should be a combination of all proper freedom for individual effort with a guarantee that the effort should not be exercised in contravention of the eternal and immutable principles of justice.

Arctic Explorers Rescued

All except one of the 37 members of the Arctic exploring party sent out under the command of Anthony Fiala in June, 1903, by the late William Zeigler, of New York, have been rescued and brought to Norway by the relief steamer "Terra Nova," commanded by William S. Champ, who was Mr. Zeigler's secretary. One sailor had died from natural causes. Fiala passed the winter of 1903-04 in Teplitz Bay. There, in November, his ship, the "America," was crushed by the ice. Afterward he made three unsuccessful attempts to reach high latitudes. His furthest point north was 82 degrees and 13 minutes. He lost with the wrecked ship a large part of his supply of coal and food, but the party was sustained by supplies left on Franz Josef Land by several expeditions.

Secretary Taft's Party in the Philippines

The visit of Secretary Taft and his companions to the Philippines appears to have had an excellent effect upon some of the visitors as well as upon the islanders. A majority of the members of Congress have been convinced that Philippine products ought to be admitted free of duty at our ports. Mr. Hill, of Connecticut, will no longer oppose a removal of the duty on tobacco and cigars, and Mr. Shirley, who represents a tobacco-growing district in Kentucky, agrees with him. Opposition to the free admission of sugar and other products has also been overcome by the statements of insular producers, who have been questioned by the visitors at several meetings held for this purpose. Mr. Grosvenor, of Ohio, says that at the coming session of Congress a bill providing for the free admission of all Philippine products will be introduced and supported by Mr. Payne, the chairman

of the Ways and Means Committee. Many speeches have been made at banquets in Manila. The most notable were those of Secretary Taft. At the dinner given by the Chamber of Commerce, on the 8th, he said that the pledges given by Mr. McKinley would be fulfilled, and that until they were fulfilled the Americans would retain control of the islands. Self-government would be given as fast as the people were fitted for it. Referring to the unpopularity of the new internal revenue law, he remarked that people who refused to pay just taxes were not fitted to govern themselves. He sharply condemned the law which will restrict trade with the islands to American ships after July 1st, 1906. At a banquet given on the 10th by Dr. Harty, the Catholic Archbishop of Manila, he spoke at length of his visit to Rome and his very agreeable association with the representatives of the Catholic Church. Mr. Roosevelt, a Protestant, he said, desired as President to act toward the Catholic Church as he would have a Catholic President act toward Protestant Churches. At a dinner given by natives, on the 11th, the Secretary spoke of the views of the American people and the policy of the Administration. In the States, he said, there were some who had the real imperialist idea of extending American influence in the Orient by purchase and conquest. A larger number would have been glad to avoid taking the Philippines, but now felt that they had become trustees and protectors of the Philippine people and must meet the responsibility. A third class favored immediate independence for the Filipinos, some because they desired to rid the States of the burden of governing them, and some because they believed the islanders could govern themselves. Mr. Roosevelt was the chief exponent of the second of these groups:

"He believes that it is the duty of the United States to prepare the Filipinos for self-government. This will require a generation, and probably longer, and the form of self-government will be left to the individuals who will control the two nations at that time. It follows that the President—and he himself desires me to say this to the Filipinos—feels charged with the duty of proceeding on this policy and maintaining the sovereignty of the United States here as an instrument of the

gradual education and elevation of the whole of the Filipino people to a self-governing community."

The Filipinos, he continued, who desired to rule the islands must educate their children in the principles of democracy, and should learn that the foundations of a self-governing nation are industry, thrift and intelligence. There would surely be a popular assembly in 1907, if no insurrection should exist. He favored some changes affecting the administration of justice, in order that there should be no suspicion that the courts were under executive influence. There would soon be free trade with the States. This, with new railroads, would promote prosperity. His own policy, the Philippines for the Filipinos, had undergone no change. It was the policy of the President. Any one opposed to it should not remain in the Government service on the islands. He had been told that Governor Wright was suspected of not accepting it, but the truth was that the Governor was "its staunchest exponent." [At an earlier banquet Governor Wright had been attacked by Señor Herrera, president of the Federal party, who asserted that the Governor was not faithful to the policy of his predecessor.] Congressman Bourke Cockran, at one of the dinners, said that he had opposed annexation, but was now convinced that the United States was God's instrument for shaping Philippine prosperity. He promised to assist earnestly the unselfish development of the islands under the policy of Mr. Roosevelt and Secretary Taft.—On the evening of the 12th there was a grand ball in the marble hall of the Government House. Miss Roosevelt, in honor of whom the ball was given by the citizens of Manila, wore a costume in the making of which the Filipino women had been engaged for three months. On the following day the visitors sailed for the southern islands.

Labor Controversies A strike of the workmen employed in various places by the American Bridge Company began on the 9th. The company employs union men only and has an agreement with them, but it sublet a contract in Boston to a firm that employs non-union men. This was the cause of

the strike, which involves from 15,000 to 20,000 union workmen.—A strike of the Hebrew journeymen bakers in New York, beginning on the 5th, has been accompanied by much riotous conduct on the "East Side" of the city, where many of the 400 shops of the employing bakers have been attacked. The 3,000 strikers demand a ten-hour day, higher wages and recognition of their union. At last accounts the employers were still withholding such recognition.—The movement of freight on the Great Northern and Northern Pacific roads has been much affected by the withdrawal, on the 1st, of 1,500 of the 1,900 telegraphers employed, strike and lockout having been ordered at about the same time. Demands for an increase of pay and for changes in the rules were met by some changes as to the effect of which there is a conflict of testimony. They were not accepted. Arbitration has been suggested by Governor Johnson, of Minnesota. The union has consented, but the companies decline to seek a settlement in that way.

Venezuela Final judgment in the case of the Government against the New York and Bermudez Asphalt Company was given on the 7th by the Court of Cassation. The original decision of May last is confirmed and the concession is annulled. A suit for damages, based upon the allegation that the company aided the revolutionists under Matos, is still pending. Agents of the Government are in the United States to obtain evidence as to the alleged purchase of a gunboat for Matos with money contributed by the company. A protest against the decision had been formally made by the corporation. It is said that our Government will await the report of Judge Calhoun, who is making an inquiry in Venezuela. Remarks in Venezuelan newspapers regarded as organs of the Government indicate that the appointment of Judge Calhoun for this mission was not welcomed by President Castro. Local representatives of the French Cable Company, whose concession or contract was recently annulled by the same court, say that the company will continue to fulfil the terms of the contract, believing that it is the victim

of "demagog justice," and that it expects no intervention in its behalf until it shall have been molested. A protest has been sent to the French Government. A suit against the company for damages, upon the ground that it assisted Matos, is pending, and representatives of Venezuela in Paris are striving to convince the French Government that the charge is well founded.

The Peace Conference

The facts that the first week of the peace negotiations at Portsmouth has passed without the withdrawal of either party and that the envoys are now engaged upon the thorough discussion of Japanese proposals, clause by clause, give grounds for the hope that the meeting will not be fruitless. Just what these proposals are cannot be said, as so far no official information as to their character has been given out. The Japanese have been more reticent to reporters than the Russians. Mr. Witte has stated that it is his earnest desire to have the Japanese conditions and, in fact, all the proceedings of the Conference made known to the public, but that Baron Komura refused to consent to it. It is known that the Japanese proposals consist of twelve clauses and it is generally surmised that they are as follows:

1. The recognition of Japan's predominating influence in Korea.

2. The relinquishment of the Chinese-Eastern Railway by Russia as far north as Harbin, Russia to retain control of the railway across northern Manchuria connecting with Vladivostok.

3. Japanese control of the Liao-tung peninsula, including Port Arthur and Dalny.

4. The surrender of Sakhalin Island to Japan, its former owner.

5. The granting to the Japanese of fishing privileges on the Siberian littoral as far north as the mouth of the Amûr River.

6. The maintenance of the open door in Manchuria and of the integrity of China.

7. The complete evacuation of Manchuria by the Russian troops and its restoration to China.

8. The granting of commercial privileges at Vladivostok.

9. The surrender to the Japanese of all Russian warships interned in neutral ports.

10. The limitation of Russia's naval strength in the Far East.

11. The recognition by Russia of the principle that Japan is entitled to remuneration for the cost of the war.

12. The cancellation of all the mining concessions in Manchuria granted by China to the Russians.

Of these conditions it is understood that the Russians object most strongly to the cession of Sakhalin and the payment of an indemnity.—Owing to the fog on Long Island the Russia and Japanese envoys going by water from Oyster Bay were delayed and did not reach Portsmouth Harbor until the morning of August 8th. Mr. Witte was already there, for he had left the "Mayflower" at Newport and had gone by rail to Portsmouth by way of Boston. The Russian and Japanese envoys and their suites first took breakfast with Admiral Mead at the Navy Yard at Kittery, Me., and then were taken in carriages to Portsmouth, N. H., where Governor McLane received them in the courthouse, after which they went to their lodgings in the Hotel Wentworth at New Castle. The first session was held in the rooms provided at the new storage warehouse in the Navy Yard at 10 o'clock on the following morning, at which details of procedure were arranged. The Russian credentials were presented, but Baron Komura explained that as he had supposed that no business would be done at the opening session he had neglected to bring the Japanese credentials. He, however, explained verbally what they were, and upon returning to the hotel in the afternoon sent them to the room of Mr. Witte, who nevertheless filed a protest upon the minutes against this irregularity. The credentials and powers of both parties were found mutually satisfactory and approved at the opening of the second day's session, after which Mr. Witte asked for the Japanese peace terms. Baron Komura suggested that they be presented and discussed one at a time, but Mr. Witte objected on the ground that this would cause needless delay. Accordingly Baron Komura gave a brief

note containing a summary of the conditions to Mr. Witte, who placed it at once in his inner breast pocket and the Conference adjourned. The Russian envoys and secretaries and advisers then remained at the Navy Yard for six hours longer considering the proposals and preparing their reply. Long telegrams were sent to the Czar and replies received, but Mr. Witte stated that he had not asked for or received instructions from St. Petersburg. The Russian reply was presented promptly on the following morning. It stated that some of the conditions proposed by the Japanese could not possibly be accepted. On Saturday afternoon, however, one of the clauses, said to be that relating to Korea, was taken up and three clauses on Korea, Manchuria and China were finished in the Monday morning session. No session was held on Sunday, the Russians attending service at the Episcopalian Church. The notes exchanged are in French and English, and these languages are most used in the conversations. English would probably be used but for the fact that Mr. Witte does not understand it, and Baron Komura insisted as a point of honor on opening the Conference in Japanese, to which Mr. Witte replied in Russian.

English and French Fleets

Portsmouth, England, has during the past week been the scenes of an international meeting which may have as important an effect upon the peace of the world as the meeting at Portsmouth, N. H. The French and English fleets combined off Portsmouth, and the two squadrons, comprising altogether seventy vessels, were drawn up in parallel columns as King Edward on the naval yacht "Victoria and Albert" reviewed them. The French squadron then entered Portsmouth harbor, passing by Nelson's flagship, the "Victory," which was flying the tricolor. A dinner, followed by a ball, was given by the British naval officers to the French officers, at which the Prince of Wales presided. The crews of both fleets were also entertained, and at night paraded the streets together arm in arm for hours, singing the French and English national songs.

Admiral Caillard and eighty of his officers, together with nearly as many more French visitors, were then taken to London, where they were given luncheon at Guildhall by the Lord Mayor and Corporation. A still greater and quite unprecedented honor was the luncheon given the visitors by the House of Commons in the historic Westminster Hall. The Lord High Chancellor and the Speaker of the House, both in their robes of state, presided, and Premier Balfour proposed the toast to "The French Navy," in which he emphasized the identity of interests of the two countries represented and the importance of their friendship as a guarantee of the peace of the world. There were some five hundred men at the tables, and in the galleries as spectators were over 300 ladies. The unusual popular enthusiasm has created a favorable impression on both sides of the channel, and the event is regarded as an offset for the recent diplomatic victory of the Emperor of Germany over France in the Moroccan difficulty.—Parliament has been prorogued without any promise by the Premier that an election will be held in November, as the Liberals desired. The House of Commons now stands as follows: Conservatives, 312; Unionists, 58, making altogether 370 Government votes; Liberals, 217; Irish Nationalists, 82, making 299 Opposition votes. The Government's majority of 71 is ten less than last February

the new Swedish Ministry, under Christian Lundeberg, will have no further reason for not proceeding with the negotiations for a legal settlement of the problem. Emperor William of Germany, who on his yacht "Hohenzollern" recently paid a visit to King Christian at Copenhagen, is reported to be in favor of Prince Charles of Denmark for King of Norway, notwithstanding his leaning toward the English. Prince Charles married in 1896 the Princess Maud, daughter of King Edward.—Notwithstanding the prospect of a peaceful settlement of the difficulty, the Swedish and Norwegian press devote considerable space to the comparison of the military forces of the two countries. A recent estimate is: Sweden, infantry, 75,600; cavalry, 2,500; artillery, 450; total, 78,500 men, with 240 guns. Norway, infantry, 55,140; others arms, 14,878; total, 70,018 men, with 186 guns. Sweden has 65 vessels of war, 11 of which are armored; Norway has 51 vessels, four of them armored.

The Away from Rome Movement

The Evangelical Consistory Council of Austria has published full reports of the Away from Rome Movement from the beginning of the agitation in 1899 to the close of 1904. During these six years there have been 31,578 converts to the Protestant Churches, the Lutheran and the Reformed, and of these 29,330 have come from the Catholic Church. The numbers have slightly decreased each year, but it is universally conceded that the religious character of the movement has deepened. In 1899 the number of converts was 6,385, in 1900 it was 5,058, in 1901 it was 6,639, in 1902 it was 4,639, in 1903 it was 4,510, in 1904 it was 4,362. On the other hand, during these six years 5,902 persons severed their connection with the Protestant Churches of Austria, and of these 5,746 went to the Catholic Church. The total gain of the Protestant Church over against its great competitor has accordingly been 24,238 in six years. For the first time the head of the Catholic Church has recognized the importance of this agitation and the Catholic churches

Norway Votes Secession

On Sunday, August 13th, a referendum vote was taken in Norway on the question of secession from the union with Sweden. The popular enthusiasm in favor of it was so great that the day was celebrated as a general holiday rather than a formal election. The vote was practically unanimous for separation. According to the latest reports, 321,197 votes were cast for it and only 161 against. The objection raised by the Swedish Riksdag, that it was not certain that the action of the Norwegian Storting in dissolving the union was approved by the people, must now be considered answered, and

of Austria have recently published an official pronouncement of Pope Pius X, addressed to the hierarchy and the faithful of the Empire, urging them to combat the movement with all their power. In this document the Pope laments the fact that the historic fidelity of Austria to the Catholic Church is endangered by this apostasy of thousands. It is officially addressed to Cardinal Gruscha, the Archbishop of Vienna, and to the other archbishops and bishops of Austria.

Macedonian Reforms

On May 8th a joint note from all the European Powers providing for the international control of the finances of Macedonia was presented to the Sultan, who delayed replying to the note until recently and then rejected the scheme. Another note, couched in more peremptory terms, was at once drawn up and signed by the representatives of the six Powers and has been again presented to the Sultan, who will hardly dare to refuse or longer delay the reforms stipulated. According to the program adopted at Mürzteg in 1903, two Powers, Russia and Austria-Hungary, were to control the administration of the turbulent vilayets of Macedonia. This has accomplished something in the way of bringing order out of chaos, but not so much as was expected of it. This arrangement will expire in October, and according to the new plan each of the six signatory Powers will appoint a financial delegate, who will assist the civil agents of Austria-Hungary and of Russia. They will supervise the collection of all taxes and tithes and the expenditure of all money for administrative purposes.

German African Wars

It is reported that the natives have risen in German East Africa and that the outbreak in this colony may be as serious as that of Hereros in German Southwest Africa, which occurred in January, 1904, and is not yet subdued. There has been a year and a half of hard fighting, with no glory or permanent advantages to compensate for the great loss of life and expenditure of money. Like most such

"little wars," this has seriously disarranged the financial plans of the Government, and has brought down upon it much sharp criticism for mismanagement before and during the war. Altogether the German Government has expended about \$65,000,000, and the end is not yet in sight, for the natives, to whom warfare is the normal mode of life, can continue their tactics of raiding and retreating indefinitely, and the country is too extensive and barren for effective policing. The losses in the army from disease are nearly as great as those from battle. Typhoid fever has caused the death of 14 officers and 341 men, or nearly 4.5 per cent. of the entire force. At the time of the rising, January, 1904, there were on duty in the colony 42 officers, seven officials and 772 men, together with 800 horses. Since that date reinforcements to the number of 665 officers, 196 officials and 13,653 men, together with nearly 12,000 horses, have been sent out from Germany. The total losses in action up to date amount to 41 officers, 83 non-commissioned officers and 305 men killed or missing, and 53 officers, 109 non-commissioned officers and 303 men wounded, or a total of 894 officers and men of the regular corps killed or wounded in action. The number of deaths from disease or in consequence of accidents amounted to 18 officers, 63 non-commissioned officers and 393 men, or a total of 474 deaths. In addition, 119 officers and men of the colonial reserves also fell or were wounded in action. Moreover, murder, disease and accidents accounted for one officer of the local reserve and 127 men who were either farmers or reservists or both. Thus the rising has so far cost the lives of some 1,100 Germans, probably exclusive of women and children, and 512 men have been wounded in action. The total percentage of losses in killed and wounded amounts to 8 per cent. of the officers and 19 per cent. of the non-commissioned officers of the force. Moreover, 425 members of the expeditionary corps have been invalidated home, and of these 307 have been finally examined, with the result that 238, or over 77 per cent., have been classed as permanent invalids.

The Coming Political Realignment

BY JAMES ARTHUR EDGERTON

[The author of the following most suggestive article was born in Ohio thirty-six years ago and was educated in common schools, academy, normal school and college in that State. He went West when twenty-one and engaged in reform politics for a number of years, also in newspaper work at Lincoln and Denver. Two years ago he came East, and since then has been doing editorial and special writing in New York.—EDITOR.]

ISSUES are born, not made. They arrive on the scene unexpectedly, confound the politicians and break and make parties by their advent. They are not unheralded, but all men are not gifted with the power to read the prophetic signs of their coming. The ability to discern these harbingers and to shape one's course accordingly marks the statesman and the natural leader.

Has a new issue arrived in American politics? Are we on the eve of a realignment of existing parties or the formation of a new party on this issue? There have been so many false alarms of this sort that the natural tendency of the man of the world will be to answer these questions in the negative. Yet the false alarms themselves are frequently heralds of the true upheaval. The attempts at revolution that, like small waves, fall short and run back down the sands, are often the precursors of the fuller tide that sweeps all before it and reaches the mark.

Recent political history records many of the smaller waves. First there was the Greenback movement, which reached high water mark in the early eighties and fell back. Then came the People's Party, polling over a million votes in its first campaign, in '92, reaching well toward the two million mark in the congressional elections of '94, then fusing with the Democracy and attaining its climax in the first Bryan campaign, of '96. Populism was still a potent factor in 1900, and in 1904 the large Socialist vote of nearly 400,000, the Populist vote of over 100,000, and the overwhelming victory of Roosevelt, due in no small degree to radical support as a rebuke to Parker and reactionary Democracy, showed that the advance tide had by no means spent its force.

Present political conditions may be

imagined to resemble very closely "the era of good feeling" under President James Monroe over eighty years ago. Yet that itself was but the prelude to the fierce struggle between Andrew Jackson and the younger Adams in 1824, resulting in Jackson's election to the Presidency four years later. From that initial point of 1824, by the way, political upheavals have appeared regularly in sixteen to twenty year periods. Thus in 1840 came the William Henry Harrison campaign, with its unprecedented partisan enthusiasm, resulting in the election of the first Whig President. In 1860 Lincoln, the first of the Republican Presidents, was elected. In 1876 was fought the memorable Hayes-Tilden campaign, the result of which is still disputed. In 1896 came the momentous Bryan campaign, with its phenomenal vote. The periods are thus seen to run 16—20—16—20. Under the same rule the next great struggle should come in 1912, or sixteen years from 1896. But in most instances there has been at least one campaign preliminary to the crucial one; thus the realignment may be expected to show itself very distinctly in 1908. In that event it should even now be forming. Without binding ourselves too closely to these figures it yet remains a fact that there is a certain periodicity in these political upheavals, accelerated or retarded, of course, by outward circumstances.

Are the present outward conditions such as would hasten this result? Is there now an issue worthy the name between the two great parties? The tariff no longer excites, free silver no longer alarms. On the rate question there is apparent unison. No partisan feeling to speak of apparent anywhere. Yet history shows that out of these political calms arise the tempests. The old issues

are assuredly dead. Is there a new issue that is alive?

Outside the merely partisan arena the signs are plentiful. Public opinion is focusing on industrial problems as never before. A Federal Grand Jury is investigating the Beef Trust. Lawson is exposing Standard Oil. The Equitable Assurance Society has drawn the attention of the world to business corruption. The magazines and leading papers are filled with industrial and political reform sentiment. Mayor Dunne is inaugurating municipal ownership of street railways in Chicago. Mayor Weaver, assisted by an aroused public conscience, has defeated a long-term gas franchise in Philadelphia. If these things are indicative, the new issue is to be found in the industrial field. What is it?

To me it seems so plain that the way-faring man can read:

Public ownership.

Go out into the highways and ask the first dozen men one may meet. Out of the dozen it will be found that at least eleven are thinking of some form of public ownership or control. For municipal problems, municipal ownership. For insurance problems, State or Governmental insurance. It is in the very air. It is in the hearts of the American people.

Yet the phrase public ownership is too vague. There must be some definite point. Municipal ownership cannot become a national issue for the very reason that it is local in its application. What is the general public utility on which this public ownership sentiment will focus and make of it an immediate objective for a national movement?

It seems to me that both President Roosevelt and Mr. Bryan, the leaders of the two great parties, have answered this question. They may have done it unconsciously, but they have done it none the less effectively. They have pointed to the natural and inevitable issue—the railroads. One has spoken for Government control, the other for State ownership. Each has taken a step toward the definition of the issue. The people themselves will take the other step; and that step will be:

Government ownership of railroads.

There is an issue that will be alive, that will never down until it is settled. It is already before the country, placed there by the President, placed there by Mr. Bryan, and placed there by the very logic of the situation.

It embraces, at least indirectly, almost every other industrial question. Ida M. Tarbell has shown how the Standard Oil monopoly was built up through the railroad rebate. Charles E. Russell is showing how the Beef Trust was built up by the railroad rebate. It is reasonable to suppose that other trusts have been built up in the same way. It is not impossible that here may be found a key to the whole trust question.

The anthracite coal strike is fresh in the public mind, as is also the disclosure growing out of that struggle that the coal-carrying roads are for the most part the owners of the anthracite mines. Presumably the railroads also own other mines in other parts of the country. Certainly they have the power of making or breaking a business, of building or destroying a town, of hurting or helping an entire community. Are not these powers too great to be lodged in private hands?

Assuredly also the railroads interfere, or attempt to interfere, in the Governments of most of the States and of the nation itself. For example, it is notorious that in the State of Nebraska two great railroad systems took turns in electing the United States Senators, and both combined to elect the Governor. Two other systems have shown a like paternal interest in the affairs of Kansas. The instances could be multiplied indefinitely. Such conditions are certain to continue so long as these great public utilities are permitted to be used as instruments of private greed.

Government ownership of railroads is not a new thing. It is already an accomplished fact in most of the nations of the world, and the movement in that direction is being accelerated every day.

Why not? The public would not tolerate the private ownership of its wagon roads. Why should it tolerate the private ownership of its railroads?

The mighty sentiment now being created in this country favorable to municipal

ownership will naturally seek a general outlet, a national expression. It will just as naturally take the form of a demand for Government ownership of railroads. The Hearst newspapers and others are already forecasting this result. Added to this urban sentiment will be an even stronger demand from the farmers and the fruit and stock growers. Let the tide once start and it will be irresistible. Years ago great communities in the South and West voiced this demand through the Farmers' Alliance. The Knights of Labor and other organizations of workers echoed it. But the time was not yet ripe. The cities had not been awakened. Many things have happened since then and are still happening to arouse the people of all sections to the dangers of private operation of this most public of all utilities. All the people who favored Government ownership before favor it still. The next movement will not have the handicaps of the former one. With the rate issue forming the storm center in the next Congress, that movement cannot be long delayed. It is impossible that the corporation coterie now controlling the United States Senate will permit any bill to pass that body that means anything. The people will then seek some other way out.

Three incidents that came under the writer's own observation, and in which he played some small part, may not be without interest, as they furnish side lights on the situation.

The first occurred in Nebraska during the legislative session of 1893. The then famous Maximum Rate Bill was the chief measure up for consideration. The writer was a newspaper correspondent and clerk of the railroad committee in the House, by which committee the bill was framed. At a critical stage of its progress he was given credit by the press for saving the life of the measure. All this necessitated a more or less thorough study of the question. At that time he became convinced that State control would never solve the problem. The question in its very nature is a national one. Railroad traffic is nearly all interstate. The upshot on this very bill bore out that conclusion; for the meas-

ure was nullified, for all practical purposes; and that not by the State courts, but by the Federal courts.

The second incident occurred many years later. For a long time the writer had urged Mr. Bryan to take up Government ownership. At one of the talks among other reasons urged by the Democratic leader against such a step at that time was that it would crowd every other issue to the rear. Now that he has espoused what really amounts to Government ownership, I wonder if he still believes that it will crowd every other issue to the rear. If so he is undoubtedly right; for it is the biggest immediate question before the American people.

The third incident occurred in the Summer of 1903. Convinced that the reactionary forces would capture the Democratic party, the writer called at Denver a national conference to form a party chiefly around the railroad issue. The result of that conference was the reuniting and revivifying of the People's Party and the placing of the Watson ticket in the field in 1904. While the movement did not assume the proportions that had been hoped, as the time was not even then ripe, enough was done to show that the issue is vital. As for the plan, it is not yet too late for its realization. And if one of the great parties does not adopt Government ownership, the formation of a party around this issue, that will eventually sweep the country, is inevitable. In this connection it may not be out of place to state that the phenomenal rise of the People's Party in the early nineties was chiefly due to a protest in the West and South against railroad domination. Especially was this true in Kansas and Nebraska, where the old anti-monopoly movement had been strong. The first People's party platform declared for Government ownership, as every platform has done since. In the same way that that movement arose a greater movement may come in all sections of the country, and from like causes.

There will be sufficient time between now and the next Presidential campaign to demonstrate to the country that President Roosevelt cannot force through Congress an effective measure for Gov-

ernment control. Unquestionably the people are with him. Just as unquestionably the railroad politicians in his own party are against him. Already the railway interests are massing for the fight. Some bill may pass, but if so it must be one that they approve. This is not the kind of a problem that can be solved by half-measures. If Mr. Roosevelt sincerely pushes the fight he will inevitably split the party, as Governor La Follette did in Wisconsin. It will be remembered, by the way, that La Follette's fight was on the railroad issue.

If the President consents to accept a meaningless bill he will find that he has started a fire that cannot be put out in such a way. There will be time to show that the new law is inoperative, and there will be a public demand for a more stringent measure. In the meantime a new national convention will be approaching, a new leader will be to choose. The Republican Party will have to take a decided stand one way or the other. Whichever way it goes it will force a split of greater or less dimensions. But who believes that as now constituted it will dare throw the railroads and allied corporations overboard?

What of the Democratic Party? If it would not follow Mr. Bryan with the comparatively moderate demands he made up to 1904, will it follow him with the added and more radical demand of State or Government ownership? That he will press this issue his best friends are now convinced. That the present party organization will be against him is just as certain. Does not the Democracy face the same danger of disruption as the party in power?

Of course, there is the remote possi-

bility that the anti-railroad members of Congress, irrespective of party lines, may rally to the President and force through a genuine rate bill. If so an immediate political realignment would have come. But of this there is not much hope. The railway attorneys and supporters in the Senate are by no means confined to one party. That a majority of that body can be found to pass a bill against the wishes of the corporations few believe. The issue must go to the people. When it does, a readjustment of party lines is certain to follow.

All the time there are the minor parties that must be taken into the reckoning: The small but determined army of Populists, under the lead of the virile and aggressive Watson, demanding the Government ownership of railways and telegraphs; and the half million Socialists, under the eloquent Debs, standing for the collective ownership of all the tools of production and distribution. Then there is always the possibility of the rising of the labor unions and the uniting of the radical and anti-monopoly forces in a new political organization that would make the Farmers' Alliance upheaval of fifteen years ago seem a Summer zephyr by comparison.

While the other trusts are being exposed, it is time that some attention were being paid to this greatest of trusts, of which the others are but branches. Through its rebates it has fed them. It holds State Governments in its grasp. It is preparing for a struggle with our national Government itself.

Is it not time that the American people should take the railway companies out of politics and should claim their highways?

NEW YORK CITY.

Portsmouth—Past and Present

BY DR. C. ALEXANDER CRAWFORD

[Portsmouth and its environs, which as the stage setting of what we hope will be the last scene of the greatest war of history has now the attention of the world focussed upon it, is interesting in itself, as the following sketch shows.—EDITOR.]

A SHORT while ago, when the Naval Appropriation bill was being discussed in Congress and a considerable amount had been allowed the Portsmouth Navy Yard, a Congressman from the Southwest arose and asked, "Where is Portsmouth?" The gentleman was promptly informed by a member from Kansas that "Portsmouth is in New Hampshire." Every citizen of Portsmouth who heard of this incident felt at that time that there was little excuse for such a question. Now, at any rate, since the Russo-Japanese Peace Commission has met at Portsmouth, the city is sure of its future fame.

Portsmouth is the picturesque seaport city of New Hampshire and is the only seaport in the State. It is at the mouth of the deep Piscataqua River, which lies between it and the State of Maine. The

river broadens out to form an excellent harbor, and over this is a fine view of the Atlantic. A chain of beautiful islands extends out from the city to the sea.

Tho a city of only ten thousand inhabitants, Portsmouth was originally settled in 1631 and is one of the oldest settlements in America.

David Thomson, an adventurous Scotchman, with ten men landed at Odiorne's Point in 1623. They were the first white men to touch New Hampshire soil, and their landing place is only about three miles from Portsmouth. On this point Thomson and his men built a stone fort, which they employed as a place for both defense and worship. Parts of the fort remained until a few years ago.

Altho relatively unimportant to-day as a shipping port, Portsmouth was dur-

Panorama of Portsmouth from the Harbor

ing both the Colonial and Revolutionary periods one of the most important seaports in the British colonies. In shipbuilding and shipping it had extensive interests.

Portsmouth was the residence of the Royal Governors until the Revolution. The old Governor Wentworth house,

built in 1670, is still standing and in good condition. It is probably the oldest house in Portsmouth, and in it were born two Royal Governors.

The old Langdon house, built in 1784, has the distinction of being erected by a former Royal Governor of the same name, who proved himself to be an ear-

Naval Storehouse, Portsmouth Navy Yard, Where the Peace Conference is Held

nest patriot for the American cause. He assisted in seizing the powder at the neighboring fort in New Castle in 1774 and in having it transported to Washington's army at Cambridge. Later he helped supply clothing from Portsmouth to the poorly clad patriots at Valley Forge.

Beneath the shades of the classic elms

say that it was the most beautiful in the town.

Another quaint and attractive old colonial house is that still standing by Little Harbor and built in 1750 by Governor Benning Wentworth. He was the first Royal Governor of New Hampshire after the State was separated from Massachusetts, and his stormy rule of

St. John's Church, Portsmouth, N. H.

about the Langdon house Louis Philippe of France, in 1780, passed many a pleasant afternoon while on a visit to Portsmouth. In after years, when occupying the throne of France, he often inquired of Americans about Portsmouth, and would refer with pleasure to the old Langdon place. George Washington, who visited at this house, would always

the province continued for twenty-five years, until 1766. This gentleman, when well past his youth, wooed and won his beautiful housemaid, Martha Hilton, who had no dowry save her bright eyes and rosy lips. When the old Governor and the lovely Lady Wentworth went in state to church each Sabbath it pleased the godly to forget the servant lass and

to smile sweetly upon the great lady as two black pages bore her rustling train down the aisle—a great change from the day when the bare-footed girl boasted that some day “I shall ride in my own coach.”

After the Governor's death Lady Wentworth married a Colonel Wentworth, not related to her former husband. At their house Washington and Lafayette were afterward guests on their visit to Portsmouth.

Immediately across the Piscataqua from Portsmouth is the island in the State of Maine on which the navy yard is situated. This island was purchased by the Government and the navy yard founded in 1800 regardless of the will of the original owner, who desired the property to descend in his family by entail “as long as the grass grows and the water runs.” The navy has constructed many of its early ships at this yard, and among the most famous of these is the old *Kearsarge*.

The navy yard is a twenty minutes'

drive in a rather roundabout way from the town, or is more easily reached by ferry. Besides the fine new building to be used for the sittings of the Peace Commission it contains a number of other large buildings, the Commandant's residence, officers' quarters, naval hospital, marine barracks, naval prison and one of our largest dry docks.

On Seavey's Island, which adjoins the yard, 2,000 Spanish prisoners were quartered during our Spanish War. Only a few days ago a large point of land projecting from the navy yard and called Henderson's Point was blown up in order to allow the largest battleship safe entrance into the dry dock. In this explosion about fifty tons of dynamite were employed and a mass of rock several acres in size was blown up. The event attracted thousands of people to witness it, and the sight of an enormous column of water and rock over one hundred feet in high well repaid the spectators for their trouble. The explosion, which cost nearly a million dollars in labor and ma-

The Langdon House, Portsmouth, N. H. Copyright, 1905, by Detroit Photographic Co., N. Y. C.

Jackson House. The Oldest House in Portsmouth, N. H.

terial, was a complete success. The enormous rock forming Henderson's Point was entirely shattered and the hitherto dangerous channel entering Portsmouth Harbor was thereby rendered about three hundred feet wider and comparatively safe.

Guarding the entrance to Portsmouth Harbor, but situated in the little town of New Castle, is the interesting and historical Fort Constitution. First constructed in 1666, it was later on called Fort William and Mary when these sovereigns ruled England. However, the fort played no important part in defense or attack until the Revolution. On December 13th, 1774, "one Paul Revere arrived express with letters from some of the leaders in Boston." He brought information that British troops were embarking from Boston, fifty miles away, to take possession of and garrison the fort. This report caused great excitement. A company of citizens, true to the cause of independence, immediately formed and, marching to New Castle, they took possession of the fort and hauled down the

King's colors. One hundred barrels of gunpowder were found. The greater part of this was afterward used in the battle of Bunker Hill. The artillery was carried away and the fort just about to be dismantled when two men-of-war arrived from General Gage and recaptured it. A great deal of the older parts of Fort Constitution is still intact. The old tower still casts its shadow over the harbor's entrance and the loopholes look out, like many eyes, over the swiftly flowing waters. Recently great improvements have been made in the fortifications and now most modern guns have been mounted.

Portsmouth is the center of New Hampshire's great summer resort belt. Its neighboring beautiful shores, stately woods and picturesque drives make it most delightful for summer residents. The breeze is almost always from the sea and even in midsummer there is rarely an uncomfortably warm day. The whole coast about Portsmouth is dotted with summer cottages. An excellent system of electric cars belts the coast both north and south. These lines connect the close-

Peace Conference Room in the Naval

by summer colonies of York, York Harbor, Rye, Rye Beach and Little Boar's Head with Portsmouth.

The Hotel Wentworth, the home of the Peace Congress, is near New Castle and is just three miles from Portsmouth. It is reached either by the picturesque Sagamore road or by the road passing over the chain of islands connecting New Castle with Portsmouth. This hotel, one of the most attractive summer hotels in New England, altho first established twenty-five years ago, is thoroughly modernized. It stands on New Castle Island and overlooks beautiful Little Harbor. From the Wentworth veranda Odiorne's Point, the landing place of Thomson, is plainly visible. The hotel consists of a large main portion, in which the Japanese Commission is now quartered; of an adjoining part, the Annex, which contains the Russian Commission, and next to that a third building, called the Cottage. The grounds of the hotel include several hundred acres. These are crossed by beautiful drives and shady paths.

The hotel faces the east and overlooks the ocean. Its white buildings stand out so prominently that they may be seen

many miles out at sea. From the rear verandas one obtains a beautiful view of the many green islands at the mouth of the Piscataqua River, and beyond the tall buildings of the navy yard and the church spires of old Portsmouth are silhouetted distinctly against the pale blue of the western skies.

The road to the old town of New Castle, one mile away, passes in front of the hotel and winds through shady groves to that picturesque village. On its way it passes the house of John Paul Jones's old fighting boatswain and the historic Walbach Tower. This tower was built by Count Walbach when a colonel in the United States Army and in command of Fort Constitution, nearby. The story goes that it was erected in one night during September, 1814, to guard the beach from British landing parties. The enemy failed to attempt a landing, however, and the tower still remains as a monument to the energy and patriotism of our brave soldiers.

Within the Hotel Wentworth's large dining-room, which seats four or five hundred guests, there are two long tables which the newcomer will immediately notice. One overlooks the breakers that

Storehouse, Portsmouth

roll in from the broad Atlantic and faces the rising sun. The other points toward the Conference Building in the navy yard and toward the setting sun. At the former every evening about 7.30 there sits the slight figure of Baron Komura, with Minister Takahira on his right and the remaining dozen or more of the members of the Japanese Commission seated

according to rank. At the latter table is seated about the same time each evening the impressive form of Count Witte, with Baron de Rosen at his right hand. The remaining sixteen seats at this table are also occupied by the Russians according to precedence. The conversation at both tables is quiet, tho animated. The merriment may come later.

HOTEL WENTWORTH, NEW CASTLE, N. H.

What of the Night?

BY ELIZABETH C. CARDOZO

WATCHMAN, what of the night?

The sun drops red on the hill,
And the dark draws near apace,
And the night wind wreaks its will;
And I—I have run my race,
I have fought my latest fight.
Watchman, what of the night?

Watchman, what of the night?

Is it fraught with many a fear?
Is it silent and dark and cold?
Is there never a comrade near,
And never a hand to hold,
Nor promise at last of light?
Watchman, what of the night?

Watchman, what of the night?

I have fought and fallen and lost,
I have fought and striven and gained,
And which at the heavier cost?
But a whisper still remained
Of an unrevealed delight.
Watchman, what of the night?

Watchman, what of the night?

Nay, is there aught to tell?
Can it prove more strange than this?
If I wake, why it is well,
If I sleep, why well it is,
So there come no dreams to fright.
Watchman, what of the night?

NEW YORK CITY.

爾 靈 山

203 Meter Hill

BY J. H. De FOREST

[This is the second article promised to our readers as the result of Dr. De Forest's trip to Manchuria. The three Chinese characters just above the heading are the first words of the poem written by General Nogi on the capture of 203 Meter Hill. The meaning is explained below. The translation of the Nogi poem is by Miss Charlotte B. De Forest.—EDITOR.]

WITH the total destruction of the Baltic fleet and the consequent hope of peace absorbing the attention of the public, interest in the recent battlefields will doubtless wane. Yet the places that have become historic by reason of victories won at frightful cost

will never cease to be intensely fascinating. Weeks before I saw the long line of fortifications around Port Arthur 203 Meter Hill had risen in my mind above all the chain of forts that constituted that almost impregnable fortress.

The whole Japanese nation was pro-

The Northeast Top of 203 Meter Hill. The central mound is made of sand bags that had been used for breastworks, and these support the wooden shaft on which is written "To the Memory of the Loyal Spirits of the Seventh Division." The whole is surrounded by wire suspended on posts made from railroad iron. At the right is the Russian Cross in memory of their dead

foundly affected by the terribly deadly struggle for the possession of this hill, which was taken and retaken day after day and night after night until its stony slopes were literally covered with corpses and the trenches near the top were filled with the dead of both sides. The daring charges of the Japanese against Shojuzan and Niryuzan and their undermining and blowing up of these forts were marvelous deeds, but the capture of none of these places, the construction of which had exhausted the skill of military engineers, touched the hearts of the Japanese people as did the bloody struggle of five days and nights that ended in the occupation of this 203 Meter Hill, which, by the way, was not a fort at all, but only an outlying hill with defensive trenches near the top.

General Nogi, the scholarly warrior whose name the whole world knows as the commander of the victorious investing army, wrote no poems over the downfall of any of those skillfully constructed forts, but after the terrible struggle over 203 Meter Hill he composed a stanza that, coming from his heart, went straight to the hearts of the millions at home as well as of the soldiers on the field:

O warriors, Your Spirits' Mount is steep!
Up its embattled sides ye scarce could creep;
And yet your glory scaled its deadly height!
Fierce shot and shell have torn its furrowed side,
In blood its altered face has deep been dyed.
With reverent awe the world beholds the sight,
Your Spirits' Mount!

The power of this little poem lies in the three words that open and close the verse and that stand at the head of this article, *Ni Rei Zan*, the ideographs of which mean to the eye of Japanese Your Spirits' Mountain, while the same words when pronounced mean to the ear 203. So not only eye and ear are caught by the sight and sound of these

The Russian Cross on 203 Meter Hill in Memory of Their Countless Dead

characters, but the deepest heart is touched of those who believe that the souls of the brave can be assembled over the battleground and comforted by the eulogies of grateful comrades.

Now for the story of the fight: This double topped hill stands five miles west of Port Arthur and the value of it is that it commands a clear view of the whole harbor, in which were lying five powerful battleships, to say nothing of the cruisers and torpedo destroyers. These were potentially the greatest peril that threatened the communications of Japan's army of half a million. If these ships could only be sunk!

Besides that, 203 Hill, being the end of the semicircle of fortifications, commands the rear approaches of several of the nearer forts and at the same time threatens communication with Pigeon Bay on the west. General Nogi wanted it badly from the very first, and as early as the middle of September he made a savage assault on three sides of the hill,

The Southwest Crest of 203 Meter Hill, with the Significant Wooden Pillars in Front of Which Are the Trenches Filled with the Dead

hoping to capture the trenches on the top. But he had to retire with heavy loss and wait until the siege had advanced sufficiently to make a decisive attack. This began on the 26th of November and lasted day and night until the noon of December 1st. Five times the Japanese planted their flag on the summit and five times the Russians with equal bravery and equally frightful losses succeeded in recovering the hill. Then came the sixth and victorious assault on the part of the Japanese, who now saw the trenches filled with the dead of both armies and the sides of the hill, especially the steep eastern slope, literally covered with corpses.

It was terrible, but it was the beginning of the end. Now at last Nogi's gunners had a chance to see what they were firing at. Heretofore they could reach the town and harbor easily enough by sending shells from their siege guns right over the range of hills on which were the forts of the enemy, but they could not see whether they hit anything or not. It was all chance work.

It had been one of the most trying experiences of the Japanese artillerymen

that they could not be sure of hitting those ships. "Why did you not use balloons?" I asked the colonel who had the guns in charge. "We did, but you can't send up a balloon high enough to look over a range of hills like these and see their immediate rear. Balloons are of little use save on plains."

But from 203 Hill every ship was in plain sight, with no possibility of escaping the coming shells. And there was no need even of dragging the siege guns up the hill and spending days in laboriously building platforms for them, for their aim could now be accurately directed from this peak. And then began the hot work of destruction on those battleships. In less than three days sixty-eight shells were seen to take effect, and one after another the ships gradually sank, until they all rested on the bottom of the shallow bay, where they lie now with broken masts, riddled funnels, ripped up decks and dangling davits. Stoessel knew that the possession of 203 Hill would mean not only the end of the Russian navy in the East, but also the speedy loss of Port Arthur, and so even after his men had been six times driven

off with frightful loss he made five more desperate attempts to recover the hill, but all in vain.

I have talked with the captain who led the three companies of soldiers in the last successful charge that took the hill. He is here in the Sendai hospital recovering from five wounds received later in the Mukden battles. But how he could have survived the deadly charges he repeatedly made on 203 Hill and have gone through those days and nights with only skin wounds is a veritable wonder. He read me from his official report the following facts: On December 1st at four o'clock in the morning he was again ordered to take 500 men and capture the hill. Two-thirds of his force carried sandbags and stones and made movable breastworks, to be pushed forward while the rest crawled up behind within hand-grenade distance. Then came the desperate struggle that lasted hours, one horror of which was that the distant Japanese gunners in helping their side

sometimes shot destruction and slaughter among their own men; another of which was that the Japanese were driven to the extremity of piling up the bodies of their dead to piece out their poor defenses. It must be remembered that this fight had been going on already five days and the top of the hill was so thick with the bodies of the dead that one could not walk without stepping on them. By ten o'clock the captain had reached the crest and planted the flag of the Rising Sun there, when immediately the seventeen ships in the harbor and all the near forts poured in a terrible storm of shells. He sent one man back to explain the desperate situation and get permission to retire, but the reply came to hold the place at all costs, as help would arrive at three o'clock. On this day alone he lost 273 of his 500, and in an earlier charge, where his regiment of some 1,500 men fought for the hill, only 60 or 70 came out unharmed. It is commonly said in Port Arthur and in the papers here that the

Unloaded Shells, After the Battle of Nanshan, North of Port Arthur

Glimpse of Trench Near the Top of 203 Meter Hill, Where Shells, Stones and the Dead Are Seen. The battle ended on December 1st, 1904. The photo was taken March 23d, 1905. The dead were once properly buried, but Chinese thieves have looted the trenches in hopes of finding treasures on the corpses and left them exposed

taking of this one hill cost the Japanese army 12,000 men in killed and wounded. From this can be inferred the Russian loss, which generally is much greater than that of the Japanese. The vast majority of the 18,556 Russian soldiers in the hospitals at Port Arthur that fell into Japanese hands came from 203 Hill.

General Nogi has the sympathy of all Japan in the loss of his two sons, his only children. One fell at Nanshan, just north of Port Arthur, while the other was killed at 203 Hill. One can imagine the deep emotion with which he wrote the words that open and close his poem,

O Mount of Your Spirits!

For me the hours passed all too quickly on this hill, consecrated by the blood of brave men on both sides. But the victory was won by the army that stands for liberty as well as loyalty, and so on

December 1st the power of despotism received one more irrevocable setback to make way for the progress of the East and of the world. To have visited this *Ni Rei Zan* was indeed an education.

We came down the steep eastern slope and took the carriage the commandant of the post had kindly given us. As we rode toward the New Town a terrific explosion was heard just over the hill to the right and a huge column of smoke shot up a thousand feet or more. Under Japanese direction Chinese coolies had been collecting unexploded shells of all sizes in and around the town and carrying them to a safe place behind the near hill. Some one blundered in handling a shell and as it exploded the shock set off the whole pile and the workmen close by were torn into shreds.

SENDAI, JAPAN.

The Sense of Smell in Ants

BY ADELE M. FIELDE

[Miss Fielde is widely known for work as lecturer at the League for Political Education in New York and for her books on China, which she wrote from her experiences as a missionary in the Far East from 1865 to 1890. In recent years she has spent her summer vacation at Woods Hole, Mass., engaging in biological investigations at the famous laboratory there. This work in science she has supplemented by keeping throughout the year various nests of ants and studying and making experiments with them, so that now she is an acknowledged authority on ants.—EDITOR.]

A Worker Ant.—*Camponotus Pennsylvanicus*

ANTS possess all known senses except that of hearing. Leading a life that is mainly subterranean, they have little need of ears, and are compensated for their lack by a marvel-

ous sensitivity to vibrations reaching them through the solids on which they stand.

Their sight is less keen than that of many other insects, and a motionless enemy a half inch distant may remain undiscovered. The light by which they see is not perceptible to human eyes, being ultra-violet.

The ants make their way in the world and thrive vastly in all countries and nearly all climates by merely following their noses, which are more highly endowed than is the same organ in any other creature whose power of smell has been tested.

The ant's pair of noses, called antennæ, project from its face below the eyes and are jointed. Among the thirty-five hundred described species of ants the joints vary in number from four to thirteen, the number being always the

Larvæ and Pupæ of *Formica Subsericea*, Enlarged

Antenna of *Stenamma Fulvum*

same in the same species and sex. Each antenna is a competent nose, and each joint of an antenna appears to have a special function, or to be a sub-nose devoted to a particular use.

In 1901 I discovered the functions of several of these joints, using for my research work the common brown ant, *Stenamma fulvum*, which has twelve joints in its antennæ.

When an ant is removed from its own nest and afterward returned thereto it immediately seeks its old comrades in the deeper recesses and is manifestly at ease in its environment. It waves its antennæ and recognizes in the air the diffused odor of its home. But if the

same ant be dropped into any other ant-nest it instantly runs away, and, if it be unable to escape, tries to hide itself. It smells an alien nest odor and is afraid. But if the final, the twelfth, joint of the antennæ be cut off, and the ant kept in hospital till it has recovered perfect health and activity, it will then be unable to discern the difference in the odors of ant-nests and will behave alike toward all. It has lost the sub-nose, whose function it is to reveal the proper domicile to the ant inhabitant.

The next, the penultimate joint, is the sub-nose that discriminates between the ant's personal relatives and those of its own species who do not belong to its

Camponotus Americanus.—Winged Queens and Four Pairs of Workers, Engaged in Regurgitating.

community. As quickly and as surely as a man recognizes his friends and takes more or less pleasure in meeting them, so does an ant recognize its comrades and evince delight in their companionship. But the ant recognizes also the odor of blood relatives that it has never before met. This sub-nose performs its function only when in contact with some part of the body of the individual under consideration. It touches the newcomer, and if the odor or savor be familiar patting and caressing may follow, while if the odor be unfamiliar a battle that may last hours or days is likely to ensue. If this penultimate joint be removed the ant thus maimed ceases to discriminate between its blood relations and ants of other communities of its own species, and will permit ants from distant colonies of its kind to share its domestic cares and joys.

The third joint from the distal end, the antepenultimate, smells through the air the scent laid down by the feet of the individual and upon the path which it traverses.

An ant may make long journeys from its abode, and so long as its track be unbroken it can return there-

upon to its starting point. A thin layer of dry earth may be sprinkled upon the track and the ant can still follow the scent, but if the track be washed away

for a stretch greater than the length of the ant then the little traveler is lost and can proceed homeward only when the scent is again picked up. Over an undisturbed area ants may go to and fro on tracks laid down many days previously, each ant following its individual scent. But if the third sub-nose be removed the ant is no longer able to follow its track, and it goes out and in no more. It behaves like a blind person in the midst of his fellows.

The next two joints, the fourth and fifth, are those that smell the inert, developing young, and probably also the queen mother, having the same odor. So long as these sub-noses are intact the ants clean, tend and feed their infants with more than human assiduity. But after these sub-noses are removed the most diligent nurses cease attending to the ant-children

Stenamma Fulvum, Somewhat Magnified

and never afterward show the slightest interest in the work of the nursery. They no longer discern the eggs, larvæ

or pupæ to whose care they were formerly devoted.

Next above these joints lie the two that perceive presumable enemies, such ants as are of alien species and therefore predatory, rapacious or hostile. All normal ants detest strangers, and, with well founded fear of personal injury from them, they avoid or attack every ant of a species other than their own. But when these two sub-noses are removed, and the ants have recovered from the involved surgery, ants of many species and even of different sub-families will live together in harmony, regurgitating food to one another and behaving as if they had all hatched in the same nest. Animosity toward strangers has been eliminated by the removal of the sub-nose that made the strange ant odor apparent. This sub-nose, like the second, performs its function only when in contact with the body of the stranger.

There is little doubt that ants orient themselves when on their journeys by the sense of smell, such as men do by the sense of sight.

After an ant is deprived by aseptic surgery of a portion of its organs of smell it takes two or three weeks for it

to recover its normal health, even in the best of ant hospitals and under the care of a highly trained nurse. But a protected ant has lived in one of my *hôtel des invalides* a full year without a nose. One of the two antennæ is often lost by ants living in natural conditions, the prominence and delicacy of the organ making it peculiarly subject to injury in battle. But I have never found in natural nests a live ant that lacked both antennæ.

The long shaft, or scape, the joint nearest the head, does not smell, and its use is probably purely mechanical. This may be true also in many jointed antennæ of the joints nearest the scape.

The antennæ are full of nerve-cells and fibers that connect with the ant's brain, lying near the proximal end of the antennæ.

The sense of smell appears to do for the ant about all that the sense of sight does for man. It serves the ants in their dark abodes much better than could that of sight, and through its marvelously high development renders them most capable administrators of their own affairs.

WOODS HOLE, MASS.

The Dawn

BY SUSAN ARCHER WEISS

[Mrs. Weiss was a personal and literary friend of Edgar Allan Poe, who admired her poems. We have published her reminiscences of Poe.—EDITOR.]

THROW wide the casement,—let the dawning
in,—

The cool gray dawn that trembles in the
East;

Tho yet the starry splendor hath not paled
Nor night's low voices ceased;

Still on the borders of the sleeping wood
The sombre shadows brood.

Dew-wet the vine upon my cottage wall,
With sudden thrills among the glossy leaves;
A little bird chirps from its hidden nest,

Beneath the mossy eaves,
Preens its brown wings upon a drooping spray
And lightly darts away.

Rosy the dawn,—the morning star hath paled,
A silvery mist lifts from the distant wold;

The tall laburnums by the garden wall
Scatter their drops of gold.

The grassy lawn, wet with the midnight's tears,
A sparkling lake appears.

Lean from the casement—bathe your lips in
dew,

Breathe in the fragrance of the spicy vine;
Drink the fresh coolness of the summer dawn
As of life-giving wine.

So, strengthened for the burthen of the day,
Go gladly on your way.

RICHMOND, VA.

Archeology in Greece

BY EDITH H. HALL

[In the winter of 1903-1904 Miss Hall was a fellow of the American School at Athens and also a European fellow of Bryn Mawr College. From March till July, 1904 she was in Crete assisting Miss Harriet Boyd at her most successful excavations at Gournia in Eastern Crete. This spring Miss Hall went on a small exploring trip in Crete and traveled through the Peloponnese, the Greek Islands and the principal archeological sites in Asia Minor, and in fact all the places mentioned in the following article.—EDITOR.]

EXCAVATIONS in the interest of Greek archeology are scattered over a field as wide as the ancient Greek civilization. But, unlike the ancient Greek civilization the field of the archeologist to-day centers at Athens. In Athens are situated the various archeological schools (French, German, Austrian, English and American), all of which have excavations under their charge. And even the excavators who work independently of these schools pass through Athens on their way out or back from their posts, both that they may use the school libraries and that they may talk over their finds with their fellow-archeologists, who, like the Athenians of

Paul's time, are always glad "either to tell or to hear some new thing." And so it is that the archeologist wintering in Athens may forget that he lives in the days of telegrams and newspapers and may get his archeological news by word of mouth reports or from the accounts given by the excavators themselves on their return.

The first news brought in to Athens last autumn came from Ephesos, when Dr. Heberdey, Director of the Austrian School, returned from an autumn campaign and gave an account of a Roman library he had finished uncovering, the best preserved ancient library known. It consists of a large central room open

A View of the Northwest Part of the Knossos Excavations. The trenches which cross the modern carriage road toward the village have now been extended to the top of the hill, where a Royal Villa of the Palace has been discovered and excavated. The narrow rooms of the palace in the foreground are magazines. The tall jars standing within these magazines were used for storing oil

at the front and approached by a flight of steps. On three sides of this room the walls are broken at regular intervals by depressions which are interpreted as cupboards for holding papyri. Below these cases runs a stone ledge some two or three feet wide, on which the manuscripts may have been spread for consultation. Back of the walls in which the papyri cases are, runs a narrow passage way. Its purpose seems to have been chiefly to secure a double wall for keeping the manuscripts dry.

Another building uncovered at Ephe-

archeologist of to-day is not confined to the sculptures he may wrest from the soil nor yet to the architectural order of the temple he is digging. His work includes a detailed examination of every stone and of every inch of soil on the site. Englishmen have long since felt that it was their duty to set on foot such a thorough-going study of the Artemision and determined last spring upon Mr. David G. Hogarth as the man to undertake the business. A more discouraging site it would have been difficult to find. There was no hope, in the first place, of finding

The Site of the Apollo Temple at Didyma, Where the Berlin Museum is Preparing to Conduct Excavations

sos last autumn was the Christian Church in which the Council of Ephesos was held in 341 A. D.

The firman, which the Austrians have obtained from the Turkish Government gives them the right of digging the entire town of Ephesos. The temple of Artemis, however, the Great Diana of the Ephesians, lies outside the town and outside the province of the Austrian excavators because it was excavated in 1869, before the Austrians obtained their rights, by J. T. Wood, an Englishman sent out by the British Museum. Methods of excavation have changed since those days. The interest of a trained

any more sculptures. Both the archaic pieces from the earlier temple, which was burned the night Alexander the Great was born, and those in the fourth century style from the later temple have been carried away to the British Museum. Moreover, the temple site has for years been used as a quarry. The squared, unadorned blocks which furnish invaluable evidence to an architect have been plundered for ordinary building purposes, while the finer architectural pieces have gone to decorate other buildings—*e. g.*, the columns in verd antique which are shown to the visitor at St. Sophia in Constantinople come

The Site of the Artemision or Temple of Diana of the Ephesians, as It Appears To-day

from the Artemision at Ephesos. In fact, Mr. Hogarth told me, when I visited the site in May, that there were doubtless more architectural pieces of importance from his temple built into a little Turkish mosque on the neighboring hill than there were to be found on the temple site itself. But this mosque does not fall

within his territory, nor will it for many years to come pass into the hands of archeologists, for beneath its floor are two or three graves, to disturb which would be sacrilege. Cows are cheerfully permitted to find shelter within its ruined walls, but the archeologist and his spade are prohibited. Finally, to add a last

A Turkish Mosque at Ephesos, Which Contains Within Its Walls Many Architectural Pieces from the Artemision

difficulty to the work, the whole temple site is under water, which must be pumped away before digging is possible, and even then there is the soft, sticky silt deposited by the Cayster to contend against and malaria, another foe of the archeologist. But one of the delights of excavating is the surprises which the ground so often has in store. In digging underneath the place where the cult-statue of the later temple stood, Mr. Hogarth came across a small hoard of gold objects. Many of these were thin, flat disks like those found in the shaft graves at Mykenæ, and were probably meant to be sewed as ornaments on garments. The decoration of these disks consists of naturalistic and spiral designs stamped upon the gold. Its style points to the very end of the Mykenean period to c. 1200 B. C. as the date of this treasure. These objects have been taken to the Tchinly Kiosk Museum in Constantinople, but are not yet on exhibition. They are important because they show to what early times the use of this temple site extends.

At Pergamon excavations are being carried on by Dr. Dörpfeld, Director of the German School. When Dr. Dörpfeld returned to Athens in November he brought back news about the Pergamon Theater. This theater is situated upon

a hillside which rises above one of the terraces on which the town is built. The terrace is narrow and serves as a high-way of approach to an Ionic temple, which stands at its north end. Accordingly it has always been a puzzle to see how the stage buildings, which would naturally have stood on this lower terrace, would have been possible without cutting off the approach to the temple. In examining the substructure along this terrace Dr. Dörpfeld noted a number of stone sockets scattered about over the area where the stage buildings would be expected to have stood. These sockets he considered to have been for the support of wooden beams which, in turn, supported a wooden stage building. The conclusion is that the stage buildings here were temporary in character and were in position only during the performance of plays. On his return to Athens, Dr. Dörpfeld noted similar holes for the support of beams in the Dionysiac Theater below the Akropolis. In accordance with his theory that the use of temporary stage buildings may have been quite general the end of the stadium in Athens was converted into a theater this spring by the erection of a wooden stage building just back of the hermae at its southern curved end. This arrangement left a semicircular space at

The Theater and Theater Terrace at Pergamon

A Nearer View of the Terrace Opposite the Theater, Showing the Stone Sockets in which the Framework of a Temporary Stage Building Was Supported

the end of the stadium for the use of the actors and a big semicircular sweep of seats for the spectators, and made, in fact, a convenient and commodious theater of the Greek type.

At still another point in Asia Minor, the site of the ancient Miletos, excavations are being carried on for the Berlin Museum by Dr. Wiegand. Until this year the work of his corps has been confined to Miletos itself, but this spring preliminary arrangements have been made to excavate the temple of Apollo at Didyma, a seat of Apollo worship which is older than either Delphi or Delos. In May the actual work of digging had not yet begun. Dr. Wiegand's attention was absorbed by the task of buying up the houses and khans of the temple site and of building houses for the evacuating inhabitants in another part of the village. According to Turkish law it is impossible for one man to own more than a limited amount of property, so Dr. Wiegand's friends and colleagues have come to his aid, and the various shanties about the temple are now owned by the most famous archeologists in Europe.

At Tiryns—to skip from Asia Minor to the Argolid—Dr. Dörpfeld was engaged during February and March in searching beneath the floors of the

Mykenean palace for remains of an earlier palace. He was successful in finding an altar which belonged quite evidently to an earlier stratum and also some earlier walls and fragments of pottery. The chronology of the Mykenean and preceding periods is so much better understood to-day than ten years ago as a result of the recent brilliant discoveries in Crete that all scholars of prehistoric archeology welcome fresh material from the mainland which they may examine in the light of the Cretan finds. The earlier palace at Tiryns fits in very well with the remains of earlier palaces which have come to light below floor levels of the later Mykenean palaces at Knossos and Phaistos in Crete. It belongs accordingly to the times of the twelfth dynasty in Egypt, or about 2000 B. C.

During the spring there are no excavations in Greek lands which can compete in interest with those carried on in Crete. Year after year the English excavator, Dr. A. J. Evans, has sent back word of some new and startling discovery at his Knossos palace. Last year it was a royal tomb, mention of which was made in the issue of *THE INDEPENDENT* of June 23d, 1904. This tomb consisted of a rectangular chamber built of well squared blocks. It was spanned by a gable roof and approached by a

"dromos" or descending roadway flanked by walls. Contrary to expectations, for the tomb had been plundered and had served as a quarry, some important finds were made in a corner of the chamber. Notable among them was a collection of well preserved bronze knives and swords of different shapes and sizes and some big clay jars painted in what Mr. Evans has termed the "Palace style," a bold and decorative style of vase painting in vogue from c. 1800 to c. 1500 B.C. When excavations

1903 it has yielded pottery of the finest Palace style.

The excavations at Phaistos and Gourniá in Crete are lying dormant this year that Signor Halbherr, of the Italian Mission, and Miss Boyd, of the American Exploration Society, may have time to bring up to date the publication of the finds they have already made. At Corinth also, where the American School is digging, no excavations have been carried on this spring owing to difficulties in obtaining rights from local land owners.

The Roman Library at Ephesus, Showing the Recesses in Which Papyri Were Kept

were resumed at Knossos in March of this year all the archeological world was saying "What next?" Within a month the annual discovery was announced. The digging began this year northwest of the palace. A narrow paved way had been noticed last year leading in a northwesterly direction from what Mr. Evans calls the "stepped theatral area," and had been followed as far as the modern village across the carriage road. This year trial trenches were sunk the other side of the village, and as the paved way again appeared, they were continued to the top of the hill, where a royal villa or summer house came to light. This is the second royal villa belonging to the Knossos Palace. Like the villa discovered in

The work of the Americans at present centers about the Erechtheion. Last year the Greek Government undertook some much needed repairs on this temple. The caryatid porch and the roof of the north porch had for a long time been in need of being strengthened, while one anta at the east façade with the architrave block which it supported had been in imminent danger of falling. Taking advantage of the scaffolding which was to be erected for these repairs, the American School secured the services of a trained American architect, Mr. G. P. Stevens, who has for two years been engaged on a set of drawings which, when completed, will show the actual state of every stone of the temple. Mr. Stevens's

investigations have led to the identification of blocks of the Erechtheion which had become scattered over the Akropolis and its slopes and to the reinstallment of many of them in their proper places in the temple. Mr. Stevens has also shown by a series of careful measurements of existing blocks and a study of their surface workings that there were two windows, one on either side of the east door of the Erechtheion. The existence of these windows was also proved by the discovery of some fragments of the carved console blocks with which they were ornamented. It is quite likely that this discovery may in time throw light on the much vexed question of the use of the east room of this temple.

A year ago last winter, when in a course of out of door topography lectures Dr. Dörpfeld was lecturing on the Erechtheion, a Secretary of the Austrian Legation in Athens asked him why it was that the Erechtheion was so unsymmetrically built. The question suggested to Dr. Dörpfeld's mind the theory that the Erechtheion was never completed according to its original plan. He now believes that the architects of the temple had planned a long, narrow building, the long sides of which were each to be broken by a porch—*i. e.*, the north porch on the north side and the caryatid porch on the south, but that their plans were interfered with and curtailed because of the popular dread of disturbing the Pandroseion, an ancient sanctuary which lay just to the west of the present temple. This theory is not one which is likely to be ever proved by direct archeological evidence. It will probably remain a theory. Its plausibility is a matter which has been much discussed in

Athens, and this discussion, together with the interest taken in the repairs and in Mr. Stevens's drawings, has made the Erechtheion the center of interest during the past winter.

Finally, among the events which have lately interested the archeological world in Athens should be mentioned the International Archeological Congress, the first session of which was held in Athens from April 7th to 13th of this year. During a week of unbroken sunshine from the opening meeting in the Parthenon to the closing meeting in the University, archeologists from all over the world met to report on their work and to enjoy together that intellectual conversation and discussion which is stimulated now, as of old, by the fine, keen air of Attica. Apart from the information and help that the meetings gave to the student in his own department of archeology—epigraphy, sculpture, the practical work of excavating or what not—the congress offered much to enjoy. No one who was present will soon forget the long and stirring discussion, shared by German, French, English and Greek scholars, as to whether or not the Parthenon frieze which still remains *in situ* should be taken down and put within a museum. Nor will it be easy to forget a bright afternoon in the stadium, when a company of Greek actors performed "The Antigone" of Sophocles with an ease and fervor which would have been impossible to any of the foreigners present, tho they had taught Sophocles all their lives. The common possession of these and many other scenes will serve for years to come to hold together those who love Greece and Greek archeology.

WOODSTOCK, CONN.

THE WORLD'S TREATIES OF PERMANENT ARBITRATION

The above graphic representation of the network of arbitration treaties now uniting almost all the nations of the world is copied with some modifications from the *Histoire Sommaire de l'Arbitrage permanent*, by M. Gaston Moch, President of the *Institut International de la Paix*, published in pamphlet form by the *Institut* at Monaco.

Ordinary arbitration treaties between two countries are indicated by light lines. Treaties providing for arbitration in all cases of disagreement between the two countries without limitation or reservation are indicated by heavy lines. Treaties under negotiation are indicated by dotted lines. Countries which have signed The Hague Convention for the peaceful solution of international difficulties are represented by double circles; those which have embodied the principle of international arbitration in their constitutions, by stars.

M. Moch enumerates 130 distinct arbitration treaties, but after eliminating those made by States that have since lost their independence, like Hawaii, Transvaal and Orange Free State, and the treaties with the United States which the Senate refused to ratify, he calculates that there were 113 treaties of permanent arbitration in force at the end of March, 1905. In the two great peace movements of 1902, which resulted in binding together the American nations, and of 1904, which did the same for European nations, the United States had no part.

AMERICAN TREATIES OF PERMANENT ARBITRATION

We are very sorry to have had to erase from the diagram on the opposite page the ten dotted lines, connecting the United States with some of the most important European countries, by which M. Moch expressed his hope that the Senate would yet consent to allow this country to join in the world movement for litigation as a substitute for fighting. M. Moch also credits us with an arbitration treaty with Peru which we are obliged to disclaim, for the treaty of 1887 does not contain any arbitration clause.

That leaves the United States in conspicuous and humiliating isolation, classed with such back-number countries as Turkey and China. So to prevent the United States from looking so lonely we have ventured to add to the diagrams lines representing our treaties with the Congo and with Mexico, altho neither of these, strictly speaking, comes under the term "treaties of permanent arbitration" as defined by the President of the International Institute of Peace. Our treaty with the Congo is, however, sufficiently strong to relieve us from any apprehensions of a disastrous war with that Power, and the treaty of Guadalupe Hidalgo with Mexico, concluded February 2, 1848, provides that if arbitration "be proposed by either party it shall be acceded to by the other, unless deemed by it altogether incompatible with the nature of the difference or the circumstances of the case." Since that date three disagreements between the United States and Mexico have been arbitrated, and being so confirmed by custom and precedent the treaty may be considered as much entitled to be classed among the world's arbitration treaties as others more technically correct.

Literature

Interpretations of Japan

"How do you people do it?" is a question my American friends have been asking me since the war began. For an answer I can point to Professor Nitobe's book on *Bushido: the Soul of Japan*.¹ At home in Nippon the following are usually taken as the essential elements in Bushido: Loyalty, filial piety, charity, righteousness, politeness, wisdom and faith.

Now for the West to understand Bushido, it must go back to the parting of the ways—the fork where the genius of the Eastern civilization parts from that of the West. With us of the Far East the State, the whole, is everything; with you of the West the center of the universe is yourself. What doth it profit a man to gain the whole world if he lose his own life? But in the unwritten codes of the samurai it is, "When your country calls look upon your life as lightly as a particle of dust." By State we of Nippon mean a good deal more than you do; it is more than a political organization called into being for the conveniences and necessities of the temporal life of ours; it is more than mere crystallization of social ethics. With us of Nippon the State is God in that it is the *rendez-vous* of all the ideal perfections of the spiritual activities in man. It is more than God with us in that the State is the embodiment of all the ideals of social and political activities of man. That is not all: the State, like God in the religions of the West, is far from being an abstract ideal and passive bundle of virtues. In State we live not only the spiritual life but the earthly as well, and in which we have our spiritual and temporal beings. The State to us is God plus the sovereign, plus government, plus society. It is therefore impossible for the men of Nippon to say, "Render unto Cæsar the things that are Cæsar's and unto God the things that are God's."

Now Bushido is the unwritten code

which defines our relations and our duties to the State and our relations and duties to our fellow men. It is at once religion and ethics and law and etiquette. As you see, then, it is not a code of honor of a certain limited class of people in Nippon. To be sure, back beyond the memory of history, time was when Bushido was "the ways of the samurai." But now and for centuries back all has been different. "Bushido is the way which all the men of Nippon—from His Majesty's Ministers to boys and girls in a mountain village—should comprehend and walk in," said the late Yamaoka Tesshu to the Governor of Shiga, who had come to him for enlightenment on the deeper significance of Bushido, and that was some years ago. And Tesshu was a star which shone in the sky of our new day with all the lustres of the old days of the castle and of the sword.

Professor Nitobe's work is not exhaustive. It is the only work, however, on the subject given in a language of the West. It does not surprise us, therefore, to hear that since its first appearance, some six years ago, it has been translated into Mahratti, German, Bohemian, Polish, French, Norwegian and Chinese.

The Awakening of Japan,² by Okakura Kakuzo, is a story of the New Nippon after the brilliant and unscholarly fashion of Carlyle. In its poetry it sometimes forgets the conscience of the scholar for the nicety of critical judgment. Always, however, the author tells his stories as one to the manner born, and you must admit that it is a comfort in these days when good people seem to turn out volumes on Nippon with the fatal facility and fecundity of a summer land for weeds. Moreover, the writer seems to be something of an artist in English letters. There is something more than mere information in the following:

"The life of the Tokugawa daimio or samurai was not devoid of amusements. Besides his

¹ BUSHIDO: THE SOUL OF JAPAN. By Inazo Nitobe, A.M., Ph.D. New York: G. P. Putnam's Sons. \$1.25.

² THE AWAKENING OF JAPAN. By Okakura Kakuzo. New York: The Century Co. \$1.40.

fencing bouts and jiu-jitsu matches, his falconry and games of archery, he had his no-dances, his tea-ceremonies, and those interminable banquets at which he would recount the exploits of his ancestors. Moreover, much time might be consumed in the composition of bad Chinese poems beneath the cherry trees. He was often wealthy and often extravagant, for his contempt for gold was ingrained. He would squander a fortune for a rare Sung vase or a Masamune blade. The marvelous workmanship of the Gotos in metal and of the Komas in gold lacquer was the result of his patronage. It is to the disappearance of the daimio and the samurai that Japan owes her sudden fall of standard in artistic taste."

Another thing: Many guests we have had in Nippon from the far Western shores—gentlemen, representatives of the Western civilization which plumes itself on its gallantry to women. Not a few of these gentlemen—and women representatives, too—have yielded to the temptation of writing books. They have written of our women more than once. I have yet to meet a work of these excellent gentlemen and ladies from the civilized West that did not libel the Nippon woman whenever he or she spoke of her. Of one thing I am very sure, that there is no set of beings so vilely, heartlessly, persistently, so blackly wronged in English prints as the Nippon woman. And here comes one of her own brothers writing in English. It is the only fair thing that I have been fortunate enough to read in English about our women. I take pride and pleasure, therefore, in calling attention to the following:

"Time alone can decide the future of the Japanese lady, for the question of womanhood is one involving the whole social life and its web of convention. In the East woman has always been worshiped as the mother, and all these honors which the Christian knight brought in homage to his lady-love the samurai laid at his mother's feet. It is not that the wife is less adored, but that maternity is holier. Again, our woman loves to serve her husband; for service is the noblest expression of affection, and love rejoices more in giving than in receiving. In the harmony of Eastern society the man consecrates himself to the State, the child to the parent, and the wife to the husband."

In the manufacture of *Young Japan*³ Prof. James A. B. Scherer shows how

³ YOUNG JAPAN. By James A. B. Scherer, Ph.D. Philadelphia: J. B. Lippincott Company. \$1.50.

hard he worked. On almost every page you can see "the sweat of the brow." The reading which he has done in the preparation of the work must have been herculean. A large portion of the book would make an excellent school textbook. Pity that heaven has not given him a pair of eyes to see and ears to hear. The author tells us that he once assigned to a class of Japanese youth toward the close of the war with China an essay on "The Noblest Deed I Ever Heard of." Ninety per cent. of the youths took the case of the Chinese Admiral Ting, whose suicide followed the surrender of the remnant of the once famous Ping-yang squadron, then in the harbor of Wei-hai-wei. "And this, forsooth, was the noblest deed of which they had ever heard!" remarks the author. And the gentleman who could exclaim in the above fashion, I fear, has never so much as read the a b c of the heart and mind of the East.

*A Maid of Japan*⁴ is a rather attractive title for a frail volume in these friendly days for all things Nipponese; much better than so many tales told of Nippon by enterprising quills from over seas, nevertheless, the volume is quite unworthy of the author of the "Letters from Japan." To be sure, the tale deals, with some insight, of one phase of that national passion for learning in the characters of Nakayama Brothers; at the same time one can hardly help wondering what it was that prevented the author—who has enjoyed such an exceptional opportunity to read into the life of our land and people—from giving to the Western readers many things of which they do not know and many things that would be interesting to them.

Perhaps the chief merit of the joint work of Mr. Higashi Katsukuma and Mr. H. Irving Hancock on the Kano school of judo⁵ is that it is made comprehensible to the Western readers. Beyond doubt, it is the most comprehensive work on the subject in English. Naturally, to make the matter intelligible to the majority of Western

⁴ A MAID OF JAPAN. By Mrs. Hugh Fraser. New York: Henry Holt & Co. \$1.25.

⁵ COMPLETE KANO JIU-JITSU (JUDIO). By H. Irving Hancock and Katsukuma Higashi. New York: G. P. Putnam's Sons.

readers, the work is rich in the number of illustrations. In fact, almost all the different stages in the evolution of some of the most important tricks are exhaustibly illustrated by half-tones from photographs. Mr. Hancock has written a good deal on the art of judo, and in the preface to the present volume, he calls it "the final volume on the subject." Of the cleverness of Mr. Higashi in the practical application of judo, the American public is no stranger to it. ADACHI KINNOSUKÉ.

An Analysis of Revivalism

VERY timely and helpful at the present moment, when there is a general feeling of expectancy in the churches, is Professor Davenport's volume on *Religious Revivals*.* The revival in Wales under Evan Roberts, which has attracted the attention of the serious and the commendation of even the most sober-minded for its very practical results in conduct, such as the wiping out of old feuds and animosities and a general payment of debts, has provoked many of the churches to attempt an imitation—an imitation rather of the outward and primitive features of the revival than of the genuine conversions which have resulted from it. To all who are endeavoring to further the cause of religion by harking back to the old revival methods Professor Davenport's book contains a serious warning—a warning all the more likely to be heeded because Mr. Davenport is in hearty sympathy with real religious work and regards conversion as a genuine and necessary experience in most normal lives. Revival methods, however, and the phenomena which accompany revival preaching of the old-fashioned kind are relentlessly analyzed, and to a believer in the gift of tongues, in trances and in violent and sudden conversions of hundreds of sinners simultaneously it is somewhat dismaying to face the array of facts gathered by Professor Davenport which prove that these phenomena are common to primitive religions the world over—Mormonism, Voodooism and the Indian ghost dance

religion all furnishing excellent examples—and that among Christians they are seen in their highest development among the most emotional and ignorant, as for instance in a negro camp meeting. The scientific and psychological explanation of these phenomena is clearly given by Professor Davenport. He takes as the basis of his work M. Gustave le Bon's "Psychology of the Crowd" and Professor James's "Psychology of Religion" and shows conclusively that the wild excesses of a camp meeting are to be attributed to the nervous instability of the individuals, such natures easily losing their balance under the hypnotic influence of the preacher and the crowd. The contagiousness of the attacks is due to suggestion, acting first on the most emotional and unstable, but gathering force with the numbers affected, until even the most sober and best balanced may be swept into the vortex. The Kentucky Revival of 1800, the Revival in New England under Jonathan Edwards and the English revival under Wesley are used as illustrations of Professor Davenport's theory, and the influence of the great revivalists is analyzed to illustrate the part which hypnotism has had in each revival period. The evil results of religious orgies are clearly pointed out and Professor Davenport draws a suggestive parallel between the ease with which a Kentucky crowd may be converted and the equal ease with which it may become possessed of a lynching mania. The latter chapters of the book are somewhat disappointing. Instead of calm, scientific analyses or a logical drawing of conclusions, Professor Davenport indulges in an exposition of his own theories and ideas, and even if the reader be in sympathy with the views expressed, he cannot but regret that a scientific work should be made the vehicle for so much dogmatic expression of opinion.

The Story of the Congo Free State. Social, Political and Economic Aspects of the Belgian System of Government in Central Africa. By Henry Wellington Wack, F.R.G.S., Member of the New York Bar. With 125 illustrations and maps. New York: G. P. Putnam's Sons. \$3.50.

Mr. Wack's aim is to prevent the American people from being misled by

* PRIMITIVE TRAITS IN RELIGIOUS REVIVALS. By Frederick Morgan Davenport, Professor in Sociology at Hamilton College. New York: The Macmillan Co. Pp. 323. \$1.50.

the campaign started in this country by the Kongo Reform Association, whose headquarters are in Liverpool and whose methods are said to be inspired by a clique of Liverpool merchants interested in the⁴ Kongo rubber trade. This association has, it is implied, enlisted the services of British and American missionaries to sustain its charges of cruelty against the Belgian administrators of the Kongo Free State, and Mr. Wack desires to show that not only are the British merchants false in their assertions and hypocritical in their attitude, but that behind their complaints there is a political conspiracy by which British statesmen are seeking to rob King Leopold II of his Belgian Empire and share the spoils with France, Germany and Portugal. The book may be considered either as a descriptive account of King Leopold's colony or as a polemic. From the former point of view it is well written and informing, tho it does not add much to the excellent work by Mr. D. C. Boulger. It is necessary to call attention to the remarkable similarity of certain chapter headings and of many paragraphs in Mr. Wack's book to those in Mr. Boulger's, a point on which the reader can easily satisfy himself. As a polemic it is plain that from the second page of the preface

until the last in the volume Mr. Wack writes from a prejudiced, anti-British standpoint. Besides, his evidence in behalf of the Belgian administrators is no stronger than that of English, German and American observers against them. Even the Belgian Commission has found cases of violation of the law. In view of these facts we cannot see how the cause of justice in the Kongo is to be furthered by this book.

✽

Semiramis and Other Plays. By Olive Telford Dargan. New York: Brentano's. \$1.25.

Miss Dargan takes the literary drama very seriously. Her volume contains three pieces. Two are in blank verse, of the high heroic type, and are curiously suggestive of Dryden and Corneille—"Semiramis" and "Carlotta." Tho they are pitched in a key which strikes one nowadays as strained or even false, they both contain some very fair passages, particularly the latter, which is concerned with the wife of the unfortunate Maximilian of Mexico. The third is an ill managed arrangement of the life of Poe, with a decidedly Byronic interpretation of the part of poet. They all show strong feeling and rather feeble thinking.

Native Making Butter at His Home in Botandana (Kivu). Wack's "Story of the Congo." (Putnam's.)

A Short Constitutional History of the United States. By Francis Newton Thorpe. Boston: Little, Brown & Co. \$1.75.

Mr. Thorpe has tried in this condensation of his larger works—"A Constitutional History of the United States" and a like history of "The American People"—to tell us "(1) the origin of our civil system; (2) the principles on which it is founded; (3) the adaptation of the plan of government to public needs, by amendment and construction, and (4) the interpretation of the principles of the Government by the supreme tribunal, the courts." All this he has done as a lawyer, not as a historian. To him the whole constitutional development is due to a series of legal controversies. The economic and political influences are little noticed. His chief sources have been documentary statutes, decisions of courts and debates in conventions and in Congress. Much of the result of this wide research is merely chronicled, not criticised. The author describes and sets forth but abstains from judgments. There is a lack of digestion and a want of perspective. This is especially seen in his account of the work of the constitutional convention. He first fails to set forth the great problem that confronted the convention: What scheme would make it certain that the States would perform their functions and that the central Government would do its work and no more? Then he fails to point out clearly what the convention really accomplished—the establishment over each individual of a double citizenship, a system in which each citizen was the subject of two States. This accomplishment and the securing of its permanency by resorting, not to the coercion of a State nor to the veto of its acts by the central Government, but to the courts—the making of the constitution and laws made in accordance therewith the *law* of the land, enforceable in the State courts, just as State law was enforced—this was the great accomplishment of the convention. All else was subsidiary, but Mr. Thorpe loses this central idea amid details of controversy of little permanent significance. This failure to give proper emphasis makes the book sure to fail as a text-book—a use for which the author designed it—except in the hands of a

very experienced teacher. In the absence of any other adequate treatment, however, the book will temporarily at least supply a real need. It contains a very useful index both of the Constitution and the book.

The House of Hawley. By Elmore Elliott Peake. New York: D. Appleton & Co. \$1.50.

The Middle West is no longer inarticulate in literature. In spite of much subsequent inferior work Mr. Garland's "Main Traveled Roads" is still a classic on farm life in Iowa; Booth Tarkington, James Whitcomb Riley and others have spoken for Indiana, and in *The House of Hawley* we have a romance of Southern Illinois, the land known as "Egypt" and long supposed to be veiled in Egyptian darkness of ignorance and bucolic sloth. The head of *The House of Hawley* is a man of energy and holds its substantial rewards. Other characters are firmly drawn and have charm and individuality, especially two lovely daughters of the house; the landscape pictures are worth study:

"The fine yellow dust which lay four inches deep in the road rose behind the briskly moving carriage in an elongated cloud, like the tail of a comet. Across the prairie similar clouds were visible for miles around, above other roads; while the impalpable remains of many former clouds still hung in the atmosphere like a haze."

The folk who people "Egypt" are essentially Southern in speech, customs and temper. The book fails of greatness because the plot is too slight and does not trouble the deep places that exist in the life of every town, however isolated; nor does it ruffle the soul of the reader. Its sincerity does not save it from the commonplaceness of its main incident, which is too slender a thread to hold our interest. The dialect is not exaggerated and that is a positive merit and a relief to tired ears.

The Princess Passes. By C. N. and A. M. Williamson. New York: Henry Holt & Co. \$1.50.

From the time of Romeo and Juliet hearts have been caught in the rebound and the preliminary practice of an unfortunate love affair serves the swain

well when he finds his true soul-mate. In *The Princess Passes* the hero tries to heal a broken heart by taking a mind diverting tour through the Alps, and diverted he is, first, by the new experience of driving a motor-car and, second, by an extraordinary boy, who gets all the best rooms and the only chicken at the inns, but who becomes the best and dearest of comrades. The descriptions of the road are unusually good and the breath of the high Alps is in the book.

Twenty-four Negro Melodies. Transcribed for the Piano by Samuel Coleridge-Taylor, Opus 59. With a Preface by Booker T. Washington.

Selections from the Music Dramas of Richard Wagner. Arranged for the Piano by Otto Singer. With a Preface by Richard Aldrich. Boston: Oliver Ditson Co. Each, paper, \$1.50; cloth, \$2.50.

The latest issues to come to us in "The Musicians' Library." The negro melodies constitute something of a departure from the previous collections in this excellent series in that they form a new musical work never before given to the world in any other shape. Each of the twenty-four has been amplified, harmonized and in other respects altered to suit the purpose of the composer, which was, he tells us, to do for these negro melodies what Brahms has done for the Hungarian folk-music, Dvôrák for the Bohemian, and Grieg for the Norwegian. The plan adopted has been almost without exception that of the Theme with Variations. While as compositions the results can hardly come to be considered as worthy of ranking with the lofty models which inspired Mr. Coleridge-Taylor's effort, they are extremely interesting as the work of a composer who is himself the son of an African black man and whose music is not alone the most ambitious, but also the noblest and best yet produced by the negro race. Mr. Washington gives a succinct account of the life and work thus far of the composer, whom he characterizes as "an inspiration to the negro," but when he writes of the negro folk-song as, apart from the music of the Red man, "the only distinctively American music," he gets beyond his depth. The Wagner book is altogether the most satisfactory collection of excerpts from the

works of that musical Titan that we have ever seen. The selection is wise and comprehensive, including representative and favorite parts from each of the eleven operas from "Rienzi" to "Parsifal," and tho the arrangements are not so full, and therefore nothing like so difficult to play, as the famed transcriptions of Liszt, they are yet thoroughly good and often surprisingly effective. Mr. Aldrich's preface is all that such a foreword should be.

How to Conduct a Sunday School. By Marion Lawrance. New York: Fleming H. Revell Co. \$1.25 net.

Commending a book on Sunday school methods and machinery is something like recommending a revolver: the better it is the more harm it is capable of doing. A Sunday school is a place where men and women of positive and earnest Christian character have an opportunity of influencing younger folks, and it is entirely possible for a Sunday school officer to become so enamored of new fangled report cards and birthday secretaries and the boys' messenger service as to make his school a place of fuss and feathers rather than of the sweet influences of godly men and women upon boys and girls. Ten years of steady contact with an honest blacksmith is worth more than all promotions in a school where "the third-year members pass through a blue arch, receiving a blue seal and a blue pin." Nevertheless there must be methods and machinery, and in many cases these might be improved greatly, and the observations of Mr. Lawrance, the conscientious and energetic Secretary of the International Sunday School Committee, make one of the best text-books of Sunday school methods yet published.

The Fugitive Blacksmith. By Charles D. Stewart. New York: The Century Co. \$1.50.

Of all the rivers that run through the fields of fiction the Mississippi has had its fortunate share of exploitation. Mr. Stewart's *Fugitive Blacksmith* is no unworthy successor to "Tom Sawyer" and "Huckleberry Finn," and we venture to predict immortality for Mr. Finerty, foreman of the "sandhouse,"—"tis me that pits the sand intil the hoomps on the

backs av locomotives"—and the generous host of "Stumpy" the tramp, with his wooden leg driven into the sand-pile while he luxuriously relates the devious story of his friend *The Fugitive Blacksmith*, whose wanderings we follow with amused interest until we agree with Finerty: "If I was radin' the likes av it in a buke I w'u'd not belave it—if it wasn't that ye can see 'tis thruel!" True the story is, tho in a whimsical fashion, and the people are veritable and valued acquaintances: Bill the blacksmith, his garrulous partner, the "girls" Miss Nellie and Miss Eva, and the delicious Finerty family we learn to know well, to respect highly and to leave with regret; and what more can we say of real or fictitious folk?

The Private Tutor. By Gamaliel Bradford, Jr. Boston and New York: Houghton, Mifflin & Co. \$1.50.

This is the story of a young American "cub" sent abroad with a Private Tutor to acquire culture and information, but who is disposed to acquire a mysterious countess instead. And it is a very good story, told with sufficient humor to make it almost a comedy. Such a book should sell well enough on its own merits. That is why it is unnecessary for the publishers to recommend it by advertising the author's lineage. He is eighth in the line of decent from Governor William Bradford, of Plymouth Colony. But he has done well in spite of this fact. A man should be very careful how he uses his pedigree as a kitetail to his genius, especially when the former comes to him from a Plymouth Rock Puritan and the latter shows an irreverent tendency toward light comedy.

The History of Negro Servitude in Illinois and of the Slavery Agitation in that State. By N. Dwight Harris. Chicago: A. C. McClurg & Co. \$1.50.

Dr. Harris has made a patient and exhaustive research among all manner of sources for the data for his volume and has thus been enabled to give a history packed with dates and other particulars. Too little is known by the general reader of the stubborn persistence of slavery, in one form or another, in several of the Northern States, and it is to be hoped

that this little book may correct some false impressions regarding at least one of the States. In Illinois, owing to the "indenture" system, the conflicting decisions of the courts and the existence of a strong pro-slavery sentiment in its southern section, a form of slavery obtained until as late as 1853, or perhaps later. A State Supreme Court decision in 1845 declared Illinois free territory, but it did not prevent numbers of negroes from being held to service against their wills. Dr. Harris throws much new light on the anti-slavery agitation, from its humble beginnings in the resistance to the convention project of 1823-24 to its climax in the "Anti-Nebraska" movement of the middle fifties, resulting in a Republican victory in 1860. The volume is stored with facts and must be of great value to all students of the subject.

History of the United States from 986 to 1905. By Thomas Wentworth Higginson and William Macdonald. New York: Harper & Bros. \$2.00.

This revision of Higginson's *History of the United States* is an extension of the former volume, which closed with Jackson's Administration. The earlier work is revised simply by an occasional change of the phraseology. The new chapters, which are quite evidently the result of the deeper scholarship of Mr. Macdonald, are also given their literary form by him and lack the charm of the earlier pages. The more scholarly conservatism of Mr. Macdonald is shown also by the shutting out of some old illustrations of the fanciful type and the introduction of new ones having real historical value. On the whole the work is one of the most valuable single volumes covering the entire period of American history that we have. Few details are given which are not significant of progress. The emphasis is in the main directed with admirable judgment. In its present form the book is to be recommended to any one desiring a brief survey of our history.

Miniatures. By Dudley Heath. Illustrated. New York: G. P. Putnam's Sons. \$6.75.

There is a peculiar charm about miniature painting. To catch and fix not only

the form and features, the pose and the characteristics, but also the spirit of the original and yet to have it all in miniature, or, as Pepys quaintly calls it, "painting in little," is by no means easy. But when miniature painting is done skillfully the art required has a perfection that is all its own. This is touched upon in Mr. Heath's volume on *Miniatures* in the Connoisseur's Library, but the chief object of the book is to present a historical account of the art which shall be suggestive and stimulating to further study and appreciation rather than to attempt an exhaustive catalog or an authoritative guide for the specialist. The literature now available upon the subject of miniatures is not so extensive but that there is ample room for the present book. Mr. Heath has taken up the consideration of his subject with enthusiastic zeal as well as with discrimination. He has been exceedingly happy in his reproduction of the colored miniatures that he has introduced. A feature of the volume lies in the fact that a number of more or less famous miniatures are reproduced in it for the first time. The book as a whole is a fine example of book making.

Iole. By Robert W. Chambers. New York: D. Appleton & Co. \$1.25.

Those who admire Fra Elbertus and those who detest him—and most people come in one of these two categories—will want to read this clever caricature of some of the peculiarities of Roycrofters. And besides these are eight beautiful pajama girls of innocence and *naïveté* such as were never before seen in books or out of them. The incidents arising therefrom are startling enough to titillate the most hardened novel reader. The course of love runs with unprecedented smoothness. Instead of requiring 400 pages to get one couple mated, as most novelists do, Mr. Chambers makes five matches in 140 pages. And we can hardly wait for the other three to grow up so he can write the sequel.

Economic Essays. By Charles Franklin Dunbar. Edited by O. M. W. Sprague. New York: The Macmillan Co. \$2.50.

These essays have mostly appeared before in the *Quarterly Journal of Eco-*

nomics, published by Harvard University and of which the late Professor Dunbar was the editor. They treat, with a few exceptions, of strictly financial questions: taxation, banking and money—questions concerning which Professor Dunbar was recognized as an authority. There are also a few essays which treat of more general and less technical topics. Among these the "Reaction in Political Economy" and "Ricardo's Use of Facts" seem to us particularly good. The first of these is directed explicitly and the latter implicitly against the so-called "historical" and "ethical" schools of political economy and are models of lucid reasoning. In a brief but excellent introduction Professor Taussig pays a judicious tribute to the scholarly no less than to the administrative qualifications of his late lamented colleague.

French Classics for English Readers. Rabelais. Selected and edited by Curtis Hidden Page. New York: G. P. Putnam's Sons. \$2.00.

If Rabelais is to be introduced into the home, doubtless this selection of Mr. Page's is to be recommended, as it seems perfectly innocuous. But we cannot help thinking that an edition or a criticism which presents Rabelais exclusively by such sides as the Abbey of Thelene and the institution of Gargantua does, as a matter of fact, fail to abstract the quintessence of his Pantagruelism.

The Lodestar. By Sidney Kennedy. New York: The Macmillan Co. \$1.50.

One of the pleasantest of summer books, where the road winds leisurely along through blossoming lanes and smiling fields, where maidens fair sit on doorsteps flecked with sunlight and flickering leaf shadows, where a millionaire summer resident, active as quicksilver, makes a Methodist fair a memorable occasion; where various things happen and always felicitously.

Hester of the Grants. By Theodora Peck. New York: Fox, Duffield & Co. \$1.50.

One of the perennial crop of historical novels dealing with the American War for Independence, the scene laid in Ver-

mont when it was part of the Hampshire Grants. There is plenty of incident of the good old-fashioned kind, tho we are thankful to be spared a few of the Indian horrors usually dished up for our delectation in Revolutionary tales.

Literary Notes

A HANDY pocket edition of the novels of Lord Beaconsfield is being published by John Lane, New York, at 75 cents in cloth and \$1.00 in leather.

....“Foolish Finance,” published by Luce & Co., Boston (75 cents), is a more reliable guide to the prospective speculator than most of the financial advice now being given in books and magazines, and is much more amusing.

....A new edition of Bernhard Berenson's study of the life and paintings of Lorenzo Lotto, which we have twice reviewed and commended in THE INDEPENDENT, is imported by the Macmillan Company. (\$2.50.)

....The latest section of the great Oxford Dictionary of the English language covers the alphabet from “Mandragora” to “Matter,” and is edited by Dr. Henry Bradley. In its 227 pages there are more than 6,000 definitions of words between these limits.

....The marine paintings of the late Edward Moran, illustrating important events in our history, are reproduced in half-tone, with descriptions of the scenes and incidents they represent, by Theodore Sutro, in a volume entitled “Thirteen Chapters of American History,” published by the Baker & Taylor Company, New York. (\$1.50.)

Pebbles

THE PROPER REMEDY.—*Old Gentleman*: “I want to get copies of your paper for a week back.” *Editor*: “Hadn't you better try a porous plaster?”—*Philadelphia Bulletin*.

Willie had an awful cold

That turned into the croup,

And every time that Willie coughed

His tonsils looped-the-loop.

—*Cornell Widow*.

....“Have you ever been hissed off the stage?” asked the girl who was thrilled at having met a real actor. “Oh, no,” he replied. “When I'm off the stage I always try to be among friends as much as possible.”—*Chicago Record-Herald*.

....A West Philadelphia lad took a nosegay to his teacher one morning last week. The teacher accepted the flowers with many thanks.

During the day she had occasion to correct him for inattention. This hurt his feelings so much that after school he walked with a proud air up to the teacher's desk. “Well, Sammy,” asked the teacher. “What can I do for you?” “Do you know that bunch of flowers I gave you this morning?” he began. “Yes,” replied the teacher. “Well, I didn't give them to you; I only loaned them.”—*Philadelphia Public Ledger*.

....COULDN'T RETRACT.—A pig-headed Arkansas editor issued an obituary of the leading citizen of his town. When the leading citizen called at the office the next morning and requested that the report of his death be denied the editor refused to accommodate him. “We are never wrong here,” he said in a lordly way. “We never print denials or retractions in our sheet.” But the leading citizen protested, and finally the editor said: “No use talking, sir; we can't deny your death. The best we can do for you is to put you in to-morrow's list of births.”—*Boston Traveler*.

....POWER OF ADVERTISING.—*Excited Gentleman*: “It's all through your wretched paper.” *Editor (who is used to it)*: “What's the matter now?” *Excited Gentleman*: “You stated the day before yesterday that a thief had entered my room, broken open my desk and stolen a sum of money, but that fortunately he had overlooked the gold watch which usually lies in the bottom drawer.” *Editor*: “Well, the facts are stated correctly.” *Excited Gentleman*: “They're correct enough. But what is the result? The infamous man came again last night and took the watch.”—*Madame*.

....A well-known lawyer is telling a good story about himself, and his efforts to correct the manners of his office boy. One morning, not long ago, the young autocrat of the office blew into the office and, tossing his cap at a hook, exclaimed: “Say, Mr. Blank, there's a ball game down the park to-day and I am going down.” Now the attorney is not a hard-hearted man and was willing the boy should go, but thought he would teach him a little lesson in good manners. “Jimmie,” he said kindly, “that isn't the way to ask a favor. Now you come over here and sit down and I'll show you how to do it.” The boy took the office chair and his employer picked up his cap and stepped outside. He then opened the door softly and, holding the cap in his hand, said quietly to the small boy in the big chair: “Please, sir, there is a ball game at the park to-day. If you can spare me I would like to get away for the afternoon.” In a flash the boy responded: “Why certainly, Jimmie, and here is fifty cents to pay your way in.” There are no more lessons in manners in that office.—*Brooklyn Citizen*.

Editorials

The Hope of Peace

THE High Commissioners of the two countries have not come so far to return in instant and angry rejection of each other's terms. They are four men of experience and wisdom. They know the horrors and the dangers of prolonged war. Now there is a chance for peace. If peace be haughtily rejected, if neither side should be willing to yield a point, the choice thus made would be a conflict of years and the exhaustion of both nations. If this opportunity be lost there will be years and years of wearing war with mutual injury and loss.

For if the war is not now ended it means that Russia, further defeated—and it is likely she will be—will retire beyond Harbin, very likely as far as Lake Baikal, and take time to reorganize and strengthen her army. Meanwhile Japan may hold all Manchuria and even Vladivostok and the coast to the Amûr, but she will have to maintain a powerful army on the continent, and for a series of years live in a state of constant war, ever threatened and ever unable to do any vital injury to her enemy. She cannot reach European Russia and very little of Russia in Asia. The bulk of the Empire, everything vital, will be far beyond her attack. It is inconceivable that she could send fleet or army to St. Petersburg. She must fight at that great disadvantage. She cannot hope to make peace at Moscow, as Alexieff promised to make peace at Tokyo. It will be a wearisome and ruinously expensive war and by a nation far from rich in resources and credit.

And if Russia is unwilling to make peace, but chooses ten or twenty years of war, she will be in even a sorrier plight. Her financial credit will be gone; she will be unable to borrow money to carry on the war and she cannot squeeze it out of her impoverished and starving people. They tell us that the people of Russia are now eager to continue the war because they will not endure the humiliating terms of peace. We do not believe it. The war will be even more intensely unpopular. Give Russia peace and she can

develop self-government through her municipal and provincial councils, grown into a Parliament of the people, and with that will come fresh prosperity. But war means the tyranny of the military junta, whose power will grow with the necessities of military rule. Liberty asks peace, just as war cries for a dictator—*Inter arma leges silent*.

And what military success can Russia expect? She is bound then to lose her whole Pacific coast. To be sure she can plan and hope to recover it all when she has reorganized her army, but that is a vain hope. Once lost the Pacific coast will be lost forever. Japan is now willing to yield to Russia all the coast from Vladivostok to Kamchatka; but can it be expected that she will be as concessive after she has taken Vladivostok and her vessels are riding on the Amûr River? Once lost, we say, Russia can never hope to send another conquering squadron to the Pacific. She could only fight by land; and, once driven back from Harbin, she can never carry an army by land, the railroads being in the hands of her foe. Besides, Manchuria and Siberia will recruit the armies of Japan, for Japan will hold and control Manchuria so long as the war lasts, and its millions will be added to her own. It will take at least ten years for Russia to build a new navy and reorganize her army so as to be able to cope with that of Japan. Think of the railroads she will have to build even to get her armies to the field, while Japan will have plenty of roads she has already built or rebuilt, and all the wide sea for her transports. In ten years China will be a very different Power from what she is now. Then China will be, like England, Japan's ally and will be able to protect herself and to aid Japan against Russia.

We see accordingly absolutely no hope for Russia in prolonging the war and much loss to Japan. Peace is essential to the prosperity of both nations. So we rejoice that the Japanese terms were not immediately rejected with scorn. The fact that both parties were willing to discuss the condi-

tions is most hopeful. It gives time for the Russian people to get over their first fit of passion and to come down to business, remembering that every year of war increases the loss of territory she will suffer and the amount of indemnity she will have to pay. Even more than Japan, Russia needs peace.

And the world wants peace. While we hope, and with some reason, that the present conference will find a way to end the war, we yet remember that either party may refuse to accept any terms of agreement. Then will not all the nations unite in a protest to Russia and Japan? Will they not ask that the scope of the powers of The Hague Court be increased and that the questions between the two combatants be referred to The Hague, to settle what is right with no loss of honor to either party? What the nations say through The Hague Japan and Russia will heed. So we ask that if the present conference can agree on no terms its members ask the Court of The Hague to settle their differences and do justice to both. When, at Portsmouth, in the darkest hour, we had nearly lost the hope of further negotiation, with the agreement to discuss the first of the terms the sun came out bright after the rain and a brilliant rainbow spanned the sky. Let it be the good augury of peace.

Mr. Roosevelt at Chautauqua

THE subjects of the President's address at Chautauqua were well chosen. No intelligent American can afford to be ignorant of his interpretation of the Monroe Doctrine or of his policy with respect to the application of it. The question is one with which a majority of our people are not sufficiently familiar. Such explanations as were made by him last week are useful, especially when they are accompanied by so clear an account of the issues in a pending case that illustrates the latest and the logical development of the Doctrine. If we insist upon preventing the forcible occupation of territory south of us by European Powers whose aim is to collect debts, we must either accept the hostility of those Powers, with all that this implies, or assume the responsibility of providing for a reasonable settlement of the claims.

This is what the President has sought to do in the case of Santo Domingo. He has sought to do it in the interest of American as well as of foreign creditors, and his purpose has been both to assist the little republic and to promote international peace. His provisional arrangement, which has not been sanctioned by a ratified treaty, is working well. Honest collection has doubled the republic's revenues, deposits for the benefit of creditors are rapidly increasing, revolutionists are discouraged, and the people are engaged peacefully in productive industry. Thus far the provisional arrangement is a forcible illustration of the advantages and the justice of his policy concerning the application of the Doctrine to problems of this kind. Final success—which, we think, can be foreseen, if the Senate's approval be not withheld—will furnish to the countries south of us proof of our sincerity and friendly purposes far outweighing any number of promises and declarations in public addresses.

At the coming session of Congress the treaty covering that provisional agreement should be ratified. "The only effective opposition," Mr. Roosevelt says, "will probably come from dishonest creditors, foreign and American, and from the professional revolutionists of the island." He has good reason to believe that certain creditors who do not dare expose their claims to honest scrutiny are striving to stir up sedition in the island and to excite opposition to the treaty in this country. But will the Senate give weight to the pleas of dishonest creditors and to the arguments of professional revolutionists in Santo Domingo? We infer from the President's words that there are Americans among the dishonest claimants. In due time they should be named. Their influence could not survive such publicity.

Mr. Roosevelt's very brief reference to the need of legislation "conferring upon some branch of the executive Government the power of effective action to remedy the abuses in connection with railway transportation" does not indicate, we are confident, any loss of interest on his part in such provisions for rate regulation as were made in the Esch-Townsend bill. In this address he was dealing with the whole broad question of

the national supervision and restraint of great corporations, and the difficulties of the Beef Trust case led him to give prominence to the problems suggested by industrial combinations rather than to the injustice of railway discrimination. Clearly, he has been much impressed by the defiant attitude of some of these combinations and by their strenuous efforts to defeat the purpose of existing laws. This is shown by his repeated denunciation of them. He warns them that if they do not submit to "reasonable supervision and regulation by the national authorities," to "the mild kind of governmental control which we advocate," they will "ultimately have to submit to governmental action of a far more drastic type." But at present there is no provision by law for such national supervision and regulation. Probably the combinations in question desire that there shall be none, but this is not a refusal to accept control and regulation under an existing statute.

There is a law against the making and the maintenance of such combinations. In certain railroad cases it has been sustained and enforced, altho it was not aimed at railroads. Against industrial combinations, at which it really was aimed, it has not been effectively used. It is to this law, we presume, that the President refers when he says that "the effort to prevent all restraint of competition has been ill-judged." If it is not a good law, it should be repealed. One way to procure the repeal of an objectionable law is to enforce it. Public opinion will then demand repeal or the substitution of a statute fitted to existing conditions. If strict enforcement of the Sherman act should cause the repeal of it, a law providing for supervision and regulation might then easily be enacted. But that repeal will not be caused by continued "moderation in attempting to enforce the law's criminal provisions." In some cases, as in those of the beef packers, he says, "it is impossible longer to show leniency" in this respect. Many persons cannot see that leniency should have been shown in any case to those who had clearly violated the statute and incurred the penalty.

Great corporations engaged in interstate business will eventually be

placed under national supervision and regulation. Such regulation and restraint will take the place of feeble and occasional attempts to prevent the maintenance of combinations designed to suppress or control competition. If the combinations should be able to prevent not only an enforcement of the Sherman act, but also the enactment of laws for national supervision, the advocates of a more intimate connection between the Government and the great industries and railways would be rapidly increased in number. But, in our judgment, the exercise of the power of supervision and regulation by the Government cannot long be delayed. At the present time there is need of a plain exposition, by some man of courage in whom the people have confidence, of the unfitness and inexpediency of parts of our national statutes relating to combinations and to corporations engaged in interstate business.

"The effort to prevent all restraint of competition, whether harmful or beneficial, has been ill-judged; what is needed is not so much an effort to prevent combination as a vigilant and effective control of the combinations formed, so as to secure just and equitable dealing on their part toward the public generally, toward their smaller competitors, and toward the wage-workers in their employ."

If Mr. Roosevelt, taking these words of his own as a text, should explain why that effort was ill-judged, why it cannot be made successful and ought not to be, and what difficulties, of many kinds, the Government has encountered in its occasional attempts to make it effective, he would add a very considerable public service to the long list of those already placed to his credit.

Poetry for Vacation

It was in the rural mood, the mood of field and forest, of wood-craft and bird-craft, that three weeks ago we wrote of "one book" to take and read in vacation. That "one book" was by a choice writer of forests and fields. But there is a more human mood, equally fit for vacation days, limited by no bog

or hill or shore, alike full of nature and full of man; and that mood requires the large rest and peace of poetry. John Burroughs invites to local study; he is for the vacation play that is also work, when the book must be consulted to see if it agrees with the life of squirrel and meadow lark and orchis and fern and cat-briar about us. Such books of plant-life and animal-life keep one busy in field and forest, and one such book, and several such, should be taken. But there are more hours that simply refresh the soul, hours to rest on the veranda, to read, with not much labor, perhaps a meaningless tale merely to waste the afternoon or, perhaps, somewhat more to invite one's soul with the world's best thought and utterance of both nature and man.

And that requires poetry. Poetry can never go out of fashion. It began in the dancing youth of the unlettered tribes, when joy and play made the measures of shout and song keep step with the measured feet. And still youth turns as quick to verse as a bird tumbles out of its nest on its untried wings; and still the choicest laurel-crowns we assign to him who can wed the best word to the noblest thought, so that its lesson can be sung to marching feet.

So with your nature-book take also a book of humanity, a book of poetry. What shall it be? Let it fit your own taste and gift. Human nature is large and men and women are many. We do not say, Take Shakespeare, as we do not say, Take the Bible. They are assumed, known to every one, not to be especially read at vacation time. We have known a friend—not a pedant—to take his vacation rest and pleasure reading the Iliad through in Greek; and others do we know who take this time to read over again their Virgil and Horace; and yet others find a not over strenuous delight in Goethe and Schiller or Racine and Hugo. But we are considering the bulk of us, English-reading people, to whom foreign languages are a study, not a holiday refreshment.

What English verse shall then the townsman take to the seaside or the mountains for the choicest quiet hour? Take the best, we say. Take that which will give the noblest thought, the purest

spirit, the freest faith in man and the surest faith in goodness and God. In poetry it is the spirit of it that one wants first, and next the expression of it. It is not necessary that it be too easy, too trite. We may exclude for this reason Longfellow and Bryant, and Pope, Southey and Wordsworth. They are hardly poets for a vacation, but rather to be served up quick and hot, at some "Golden Treasury" counter, or in some pocket volume of their choice short poems. Similarly the humorous poets, Hood and Holmes, are excluded. They are for the library, not for the satchel. For the long leisure hour of the vacation weeks we want something larger and more serious and worthy.

It is impossible to choose only one book. But choicest of all of the elder poets are Spenser and Milton. Spenser is not read enough now. Who has read through the "Faery Queen"? Who even knows his "Prothalamion," the daintiest bit of verse ever put into English words? How it lingers on the tongue? Who would not bid "Sweet Themmes" to flow on and on, and never "end my song"? And with what a delightful liberty of leisurely Alexandrines the verses of the "Faery Queen" conclude the meandering intertwining rime of their stanzas of knightly love and war! Spenser is a poet for the disburdened rest and peace of vacation weeks.

And so also is Milton. They tell us that Milton is hardly read now. So they tell us the Bible is not read; we do not believe it. But Milton is not like Spenser, steeped tho he was in Spenser, as well as in the classics. Milton is a poet to be read at leisure, the "Paradise Lost" once a year; and five of the minor poems quite as often. They can occupy a fairly long vacation, and one will be fed with something beyond chaff. "Lycidas" is the poet's poem, the test by which one can decide whether he really loves good poetry. It is a poem to be committed to memory and to be a part of a wise man's mental furniture. It is surcharged with the modern spirit of faith, courage, Christianity, but set in the fashion of the classic pastoral; and twice the poet finds the pagan fetters too tight for him and breaks away to return again, and a third

time he breaks away, and is satisfied not to return, but to remain among "the solemn choirs and sweet societies" of the "saints above." Take Milton.

But are there no later poets? Yes. There are Shelley and Keats, for their worshipers; and there are Burns and Coleridge; and there are the two Victorian poets, Tennyson and Browning. But of the two last one is enough. A single taste, for a single summer, can hardly embrace them both. Tennyson, the master of measured music, the painter of words, the teacher of all of us how to say a sweet, true thing truly and sweetly. "The Brook"—it flows as the water flows—the words bubble and babble on the pebbles. Tennyson is the prophet of hope rather than of faith, of questions that ask an answer but fail to find a sure response. His *Idyls of the King*, and especially that which tells of the search for the Holy Grail, touch the highest mark of noble and tender sentiment, with assurance that somehow failure and loss will work out good. Let those that will take Tennyson and be satisfied.

Or Browning. There is pleasure and task for deliberate souls. No longer is it music of verse, and no longer is it hope in doubt. It is rugged words and rugged faith. Not many will choose him, but for those who will no voice of prophet or bard is like his.

But is there no American poet whom one can take as a chief companion in the forest or by the sea? Yes. Lowell and Lanier; they reach our high-water mark. Poe is out of the running. He is good for an hour. The others—when shall we have a really great poet from our soil, one to rank with the five or six great poets of Britain?

Publicity Topsy-Turvy

AMERICANS are supposed to have a sense of humor, yet there is probably no people on earth so addicted to doing ridiculous things in a perfectly naïve, matter of fact and even professional way. A beautiful example is afforded by American ideas on the subject of "publicity" and American practice in turning "publicity" topsy-turvy.

It will be conceded, we suppose, that the word "publicity" by derivation and

centuries of usage denotes something opposed or contrary to "privacy." There would seem to be a certain fitness, therefore, in associating publicity with things that are of public interest and concern rather than with private affairs. By the common consent of mankind also "there is a time for all things" under the sun, and there are times when even matters of grave public concern may wisely be shielded from publicity. Of such concerns military plans and diplomatic negotiations have hitherto been regarded by reasonable folk as important examples.

These simple principles of world wisdom are curiously unacceptable to the American mind. With the aid of newspaper editors and reporters we have worked out a theory, as distinctively "American" as Dingleyism or the Monroe Doctrine, that the only proper subjects for publicity are private affairs, especially the more intimate relations of husbands and wives and those relations of foreign Powers to one another which, if commonly talked about, would get the whole civilized world by the ears in the shortest possible time and raise to the *nth* Power all conceivable possibilities of slaughter.

Acting upon this theory American newspaper men lost no time in presenting their compliments to the peace commissioners of Russia and Japan on their arrival at New York, and, with urbane assurance, inviting them to disclose forthwith their instructions, mental reservations and miscellaneous ultimatums. When, with equal urbanity, the plenipotentiaries declined to reveal their intentions and their "past," the newspaper men were not insulted; they were not even aggrieved; they were only surprised—naïvely, wonderingly surprised. And these same newspaper men, whenever news runs dry, will doubtless go on for years to come writing funny paragraphs to prove that "foreigners," unlike Americans, have no sense of humor!

All this, however, is only one-half of the American theory and practice of publicity. The other half is quite as interesting and more important. It consists in the assumption, tenaciously held and religiously regarded, that matters of real

public concern, upon which every citizen should be fully informed, ought to be very carefully covered up, and that to reveal them, or even indiscreetly to allude to them, is always a grave breach of decorum. Chief among such concerns are the fidelity or faithlessness of all public servants, the management of political parties and the conduct and accounts of public service corporations.

An official having been elected or appointed to a position of public trust should be "honored" and in general taken at his face value. To inquire too curiously into the conduct of his office is to "open the door to scandal," which is annoying to any administration. In like manner, party bosses are deserving of the esteem of mankind. Their services are indispensable. Moreover, they are astute men, and for ordinary humans to question them too closely or call them to account is a presumption that no sane politically minded person would think of being guilty of. That is to say, he would not think of inquiring into the boss's conduct in so far as it is political. If, however, the boss should be so unfortunate as to fall upon domestic difficulties that would be another matter altogether. These should be fully aired in the "sunlight of publicity." The newspaper reporter should by any means, lawful or unlawful, obtain possession of the originals of any tender epistles that may have passed between the gentleman and his wife, and especially any that may have passed between him and other ladies, and should print them in full. If possible, he should reproduce a complete series of family daguerreotypes, or other portraits, revealing the development of facial expression since infancy.

As for public service corporations, their case is even clearer. The public has bestowed franchises and other valuable considerations upon them, and has devoted a large part of the time of its legislators and executive officers to hearing and granting corporate requests. How exceedingly indelicate, then, it is to intimate to these beneficiaries that they should render any account of their service to the public that has thus aided them! It is like asking your guest when he departs to leave a written statement informing you how many towels he has

sent to your laundry bag, or whether he has slipped a cake of your soap into his portmanteau, and what fees he has left for your maids and butler. Such demands can have no other effect than to substitute hard and practical business methods for the gracious amenities of life.

Such, in brief, is the well-established American theory and practice of publicity. We are aware that we shall be regarded as old-fashioned and unpatriotic in suggesting that it is altogether a topsy-turvy business. Nevertheless, at the risk of being thought queer, we venture to record our conviction that as a nation the American people would in the long run be happier, to say nothing of showing a more "decent regard for the opinions of mankind," if they could persuade themselves to adopt the older and, as we believe, more reasonable view of publicity. We should like to live to see the time when public affairs shall be regarded as public and private concerns as private.

An August Month

AUGUST is well named. Blessed month of grapes, pears and peace. At last summer has got through shaking us with thunderstorms. The grass is in the barn, the wheat is in the granary, or it is ready for the thresher. The stock broker is at a loss for excitement. There is yellow on the fields and there is yellow in the sky. Blackberries blacken the hill-side glens, where the heads of boys and girls show far away among the bushes. To-morrow there will be blackberry pies. It is curious how everything has a hidden meaning and a secret fitness: strawberry shortcake, raspberry jam and jelly, plum pudding, blackberry pie—all these were in the very *nature* of things.

Why the birds will not any longer sing is hard to find out, nor need we be inquisitive. Our catbirds will at least talk with us till our collie, greedy of companionship, comes with a pathetic eye and wishes to know what friends we have beyond and above himself. Why, you jealous pet! this world is big enough for a dozen friendships. Why should the birds be expected to sing all through the year? Do we not ourselves find sly

paths in the woods and look out into the valley as a fox looks out?

Yet it is a good month for picnics. There is a leisure, just before hop picking and corn cutting and just after oats and wheat have been stored. Did you ever go to a farmers' picnic? If not, you do not know the American people. The whole population of our cities should be turned out into the country through the whole of this month. If they cannot afford to stop work so long let them take hold with the farmers in the fields. There is need enough for every one and many would never go back into the smoke and the crowd. Is there not an easy solution of the help problem—to take the city out into the country while the vineyards and orchards are just ripening their fruits? Here are the hands and there is the work and the food. Picnic day in the country is not a mere frolic day; it socializes, bringing the scattered people together. On the contrary, picnic for the city crowd is good only because it scatters. By way of the picnic our factory hands learn that there are looms in the woods and that water power has something to do in the world besides run machinery.

August is vacation month—that is, the school buildings are closed; but, on the contrary, the great big schoolhouse is just opened—the house without a roof. "The fact is," writes a college boy, "I have really learned more during my vacation than at any other time. Camping in the Adirondacks and serving as waiter at hotels have taught me some lessons I could not get from text-books." This is probably true of all the thousands of young folk who do not go to camp, but are only let loose into the country. Once get a boy to look for himself and he will find the world is piled up with books of which the fields everywhere are printed pages. Arnold White speaks of our "universal half-education." We have not learned, with all our study, to see well. It is not only what *is* about us to which we are blind, but what is *going on* about us. The eyes and the ears have not got over their savage inheritance: watching for the things to eat and the things that are dangerous. When the painter Rosseau drew an oak a peasant said, "Master, why are you making that oak when it is already made?" A mar-

velous deep question! Is not most of art hung on the walls of people who cannot see the very same things before they are painted? Does this sort of art teach these people to see better or not to look at all? Surely the greatest gallery of art is the unpainted forest, the hillside farm and the valley meadows. Vacation helps us into the bigger schoolhouse, with the larger library and pictures that live and grow.

The orchard and the vineyard are now the witching places. We do not mean the vineyard where the vines are cut down to three or four feet and the trellises are only rows of posts, where the bunches hang mechanically; but the vineyard where vines can grow a bit free and climb and swing their clusters in the wind; where occasionally a tendril grasps a neighboring tree and lifts itself up among the butternuts or the apples. There is nothing so full of fun and frolic and of good nature and of general boyishness as a grapevine. The fruit is better than mutton for strength and certainly more delicious. It was a sorry joke when carelessly eaten beefsteak charged appendicitis over to grape seeds. But why swallow the seeds? You will hardly get the flavor of a Lady or a Lindley grape by sliding it whole into the stomach. Nature arranged it so you should get a perfect taste while rejecting the seeds. However, never stop satisfied with less than four or five bunches of grapes. Eat them before dinner, then make your dinner of them and take a few bunches for dessert.

Every kind of fruit has its charm and its season, being less delightful out of season. The first apples ripen, through the heart of the apple belt, about the middle of July, and the first pears a little sooner. During August they lie all over the orchard floor in careless profusion. How beautifully the Astrachans fit into the green sod with their crimson cheeks. Nature did not intend to create very early apples. These are the work of human selection and artful breeding. We have been widening the orchard season just as we have enlarged the size of our fruits and are improving the flavor. It is, however, hard to tell what is Nature's share in horticultural progress.

Every one should grow more fruit

than he needs. A dozen cherry trees can be planted along the fence on a line one hundred feet. These will bear bushels of bird food, if not wanted by human folk. Let the songsters have one such row on every ten-acre homestead. Sow your lawns occasionally with cracker crumbs also for the little fellows that prefer grain. A happy home is worth it. It is strange how familiar one may get with the birds, with cats out of the way. These prowlers have a beauty of their own, but with their claws they know only war. Truly, but it is a fine thing to let the chipping birds have safe houses in the grass. They look up at us as we pass as if to say, We know you; you are all right. We can trust you. What an accursed thing it is not to be trusted by our weak and harmless neighbors. After all, the underlying thought of Nature is not strife, but mutual helpfulness. There are scores of co-operative birds and only half a dozen marauders and destroyers. Man's true place in nature is to subdue the evil disposed and foster the right-minded.

Political Boycotts

THE first boycott, that which gave the name to the weapon, was political. Its purpose was to make English law impracticable in Ireland.

Just now the Chinese merchants and people have united in a boycott which is both political and international. The sole purpose of it is to affect legislation in this country. They agree to refuse to buy American goods so long as America continues to insult and abuse their citizens who visit this country. They are perfectly justifiable in the boycott, for our law excluding Chinese is an insult to the nation; and the manner of its execution has been worse. It is not strange that the people of China are indignant and their method is effective. Already and immediately President Roosevelt ordered the officers in charge of immigration to show decency and courtesy in their discreditable task. The subject became a matter of serious consultation in the Cabinet; our consuls were directed to report the nature and extent of the boy-

cott; and a protest was made to the Chinese Government against so much of the boycott as prevented the unloading of American vessels in China. That is a treaty right which we can insist upon; but we cannot compel Chinese to buy what we land in their ports. There they have the advantage. The free will not to buy is as essential as the freedom to buy. A stout "No; we don't want it," is final. A boycott is effective; and such a boycott as this would be felt here in America. It would be a serious loss to men who have influence in legislation. It would be felt on the Pacific Coast, where the shipping trade with China is carried on, and where it would suffer. In this boycott, a perfectly justifiable one, our sympathy is with China.

Another sort of political boycott, a local one, is developing in certain of our Southern States. Its purpose is to secure a repeal of the laws against what are called Jim Crow cars. These laws forbid people of any discoverable tinge of negro blood from riding on the same seats, or in the same cars, with white people—that is, unless they ride as servants or as nurses of white children. Precisely as against China, the legislation is in its very terms an insult to the race. And precisely as with the Chinese, the administration of the law is unjust. The law requires equal accommodation to both races, but that is not given. It is first-class price for third-class accommodation. The most refined ladies are driven into seats with the lowest characters. They are not allowed a berth in a sleeping car. They must sit with smokers in filthy compartments and with filthy people, no matter if they can afford to pay for the best accommodation. We have a long letter from a woman in very honorable official position in Washington, who has just buried her mother, her death hastened by the fact that she, a colored woman of years, willing to pay for the best the road could give, coming from Texas was compelled to sit up three nights on hard seats, in smoke and filth, with not another woman to help her when too weak to move without assistance. Intelligent men do not

like to have their wives and daughters and mothers thus treated as no better than brutes, and it is not strange that they are finding the boycott.

Everywhere throughout the South, where this cruel law has been enacted, the negroes are inaugurating the boycott. They refuse to ride in the trolley cars. That touches the pockets of the owners of the lines, for the negro patronage is not small. They walk, or they organize hack service.

In Tennessee the Jim Crow law went into operation July 5th. No trouble was expected. There has been none. The negroes simply refuse to ride. At Knoxville, Chattanooga, Memphis and in other cities they walk or establish a hack service for their picnics. There is a dearth of cooks in the fashionable districts. It is a question, says a correspondent, whether any decent negro will brave public opinion by riding on the cars.

There is an amusing side to the subject in Florida. There the law went into effect July 1st. Accordingly the street cars assigned the front seats to white people and three back seats to colored people. But there is in Jacksonville a car line run by colored people, and they put the colored people in front and the white people behind. On the white lines not a colored person would ride. They planned to test the matter in the State court. A negro took a seat with the white people and refused to leave. He was arrested; but the State's Attorney refused to prosecute. The law was already unpopular. After a few days, and no trial, a negro took a white seat on the colored line, and was arrested by the colored conductor, bound over and sent to jail. He was then released by a writ of habeas corpus, and a day set for hearing. When it came up for trial Judge Call declared the law unconstitutional and discharged the prisoner. The matter will go to the Supreme Court, where it will be settled whether class legislation is against the constitution of Florida and the Fourteenth Amendment of the United States.

The boycott can be very unjust and cruel, but it can also be a very useful

political weapon. It touches influential pockets, pockets that may even hold legislatures.

Secretary Taft in the Philippines

Plain speaking is what the Filipinos heard from Secretary Taft at Manila, and it will do a few misguided patriots good. He told them distinctly that the United States does not propose at any assignable time, and probably not for a generation or more, to give independence to the Philippines. We have a responsibility there for peace and order, and we propose to exercise it. But this involves on our part, and especially on the part of Congress, the duty to consider absolutely the interests of the people there; and this is what is Mr. Taft's desire and that of President Roosevelt. We wish we were as certain of the good will of Congress. The tariff which we have imposed there, with the coastwise shipping restrictions, needs to be removed, giving the Philippines practical free trade; and Secretary Taft sees this and will use his influence with Congress. But Congressmen are apt to consider our interests, as exporters, rather than theirs, as importers. It is of much importance, of course, to give the greatest political self-government to our colonies, but industrial progress is of quite equal necessity. What Lord Cromer has done for Egypt has been done wholly by industrial means, improving the conditions of life, and the political reform may follow later. We have done much, and done well, for the political development of the islands, but now the chief need is that which Secretary Taft and his party of Congressmen will, we hope, press upon Congress.

Alice in Wonderland

Mr. Howells must be happy in these days. His favorite contention, the dominance of the "Young Girl" in American life, upon which he has insisted until it has become a fixed tenet of his literary and social creed, has a most charming illustration in the triumphal progress of the young lady

affectionately if somewhat fatuously called the "Princess Alice." Photographs of Secretary Taft's party taken on ship or on shore have the Young Girl as the most prominent figure, even eclipsing the Secretary, which is something not every one can do. She holds the center of the stage, and the papers report that both in Hawaii and Manila the crowds gathered to see the party anxiously questioned each other: "Which is Miss Roosevelt?" not "Which is Secretary Taft?" We are assured by those who know her that the "Princess Alice" is a simple, unaffected young girl, and every good American wishes her with all his heart the thoroughly "nice time" which is her birthright. As for the deposition of the reigning Princess after four years, so that unlike her prototype in Wonderland she will shrink from her present exaggerated stature to normal size without the aid of the magic mushroom, she needs no sympathy of ours nor of any man, as, according to Mr. Howells and according to fact, she will, as a young American girl, have a position superior to that of any foreign princess, whose destiny she need not envy.

Graft of Old Since George Washington became President the United States has expanded from a fringe of Atlantic settlements across the central prairies to the golden mountains that edge the Pacific slope. Our population has increased from three millions to eighty millions. Dozens and scores of men are worth as many millions of money, while only George Washington then approached the million limit. Equally it is natural that speculation and graft measure in larger terms and amounts now than then, but they are mistaken who believe there is now more relative public dishonesty than there was then. Professor Shepardson, of the Department of History in Chicago University, calls attention to the fact that Peter Faneuil, giver of the Cradle of Liberty to Boston, was engaged in the liquor business, and a smuggler of liquor at that. Indeed, one of the signers of the Declaration of Independence was in-

dicted for smuggling. Congress was not ten years old when one of the best known Senators was indicted for accepting a bribe. And we believe that there are relatively quite as many men who serve their country not for profit as there were in the days when George Washington refused to accept any salary. Secretaries Taft and Root sacrifice many times their official salaries when they accept office. The country is growing better rather than worse.

Sanitary Standards Simultaneously with the reports from Washington of the excellent sanitary work done on the Isthmus of Panama comes an announcement from Tokyo that the Japanese emigration officers have advised the Japanese Government not to send laborers there because the sanitary conditions are so bad. These statements do not conflict. It is merely a question of relative standards. We have done better than the French, but we are still behind the Japanese in the management of the health of large bodies of men. When we compare the very small death rate from disease in the Japanese army during the most severe war that history has known with the shameful losses among our soldiers in peaceful camps during the Spanish-American War we must confess that the Japanese have earned the right to criticise us. But we may hope some time to see Panama setting an example of cleanliness and health to our home cities. Already we see a curious reversal of former conditions in the fact that Havana now quarantines against New Orleans. One of the lessons of the present yellow fever epidemic is that no city can afford as a matter of business to have slums. It costs too much to maintain them.

Passive Resistance As a method of political opposition the refusal of individuals to pay taxes or render service to a Government deemed by them illegal or unjust seems to be growing in favor. In three European countries such "passive resistance" is being encouraged by party leaders. In

England many men have had their goods seized and sold at auction rather than voluntarily pay taxes for the support of schools under the control of the Established Church. In Hungary the managers of the majority in the Lower House of the Diet, holding that the Fejervary Ministry is unconstitutional because the House has passed a vote of no confidence in it, urge all patriotic citizens to refuse to pay taxes or render military service. Local officers are advised that they will be acting in obedience to law if they refuse to collect taxes and to recruit, and if in consequence of adopting this "correct attitude" they lose their places, they are promised full compensation "on the restoration of normal conditions," which, being interpreted, means when the Opposition get into power. At the Zemstvo Congress in Moscow last month a resolution was adopted favoring all forms of resistance, short of absolute force, against the unjust acts and orders of the Russian officials. One member went so far as to say that even if General Trepoff obtained the Czar's signature to an unjust measure they would refuse obedience. Such a citizens' strike has often been resorted to in this country as well as elsewhere, but it is a dangerous weapon, very liable to abuse. To make each individual the judge of the justice or legality of the acts of Government is a line of conduct asymptotic to anarchy.

The Athanasian Creed

The agitation in the Church of England for deliverance from the Athanasian Creed grows apace. A memorial has been drawn up and signed by over ninety of the resident members of the University of Cambridge, all communicants of the Established Church, asking the Archbishops to take as speedy steps as possible to relieve the Church of the necessity of repeating the damnatory clauses. "Taken in their plain meaning" these clauses, they say, "go beyond the warrant of Scripture, and are a grave offense to the consciences of a large and increasing number of loyal Churchmen" and "a great and growing danger to the Church." Among the names

are nine masters of Cambridge colleges, professors of divinity and distinguished lecturers and fellows. And two-thirds of them add that not only the damnatory clauses but the whole Creed should be excluded from the Prayer Book. The American Episcopal Church has never had this Creed. They dropped it from the beginning. They accepted the spirit of Isaac Watts's comment on his poetic version of one of the imprecatory Psalms: "Cursing one's enemies is not so evangelical a practice. I have therefore given certain verses of this Psalm another turn."

Correcting the Calendar.

The eccentricities of the solar system have always been a great annoyance to the orderly mind of Frenchmen. That the year should not be evenly divisible into any of its subdivisions, the week, the day or the hour, and that the month should contain an unequal number of days and that the days of the week in different years, are inconveniences which we all recognize, but the French alone have had the courage to attempt to correct such of these irregularities as are within human power. The reformatory spirit is once more active in the French Republic. The revocation of the Concordat now, like the overthrow of feudalism by the Revolution, has revived the attempts to reform and secularize the calendar. The religious holidays as such have all been abolished, but in the place of them, and very conveniently on the same dates, are established *fête* days, the legal names of which have no ecclesiastical taint. It is not proposed to decimalize the days as was done by the radical reformers of the Revolution, nor do we hear of Brumaire, Thermidor, Prairial and Ventose as yet, But Camille Flammarion, the astronomer whose vision perceives the astral bodies of the theosophists as well as those of his profession, recommends the adoption of a new calendar. He would have a month of 31 days follow every two months of 30 days each. The extra 365th day, and on leap years the 366th, would not be called by the name of any of the days of the week, but would be

given special names. This is something like the Revolutionary calendar devised by Laplace, with its year of 360 days and five extra *Sansculottides*. A still more radical scheme is proposed by M. Léon Bollack in *La Revue*. He would have a week of five days instead of the sacred seven or the Revolutionary decade, both of which he considers too long a period of uninterrupted work, as is proved by the modern tendency to make Saturday a half or whole holiday. The ordinary year would thus be divided evenly into 73 of these quintads. Like Flammarion, he would have the year begin with the spring equinox, March 21st. It is obvious that all these schemes for reforming the calendar are actuated by the double motive which Luther gave for taking a wife, to please himself and to spite the Pope.

There constantly comes news of fresh discoveries in Bible lands. One of the serious questions has been as to the burial customs of the original inhabitants of Palestine, whom we call the Amorites. It has been supposed that they burned their dead, but there is a report of a late discovery of several burial caves which are dated at 2500 B. C. by Egyptian scarabs, and where the dead are laid side by side. Prof. Nathaniel Schmidt, who is in charge of the American School of Archeology in Jerusalem, this year has followed his exploration of the Dead Sea by a further exploration of the region to the south of Palestine and especially the ruins of Rehoboth, where he has found a multitude of inscriptions. The American School at Jerusalem is not properly housed. It needs a place for library and museum, and we should be glad to hear from any one who would give \$10,000 for the purpose.

We regret to record the death from yellow fever of Archbishop Chapelle, of New Orleans. He was on a visitation to country parishes, but on getting news of the invasion of yellow fever returned to the post of danger and duty and immediately received the fatal infection. Clergymen and physicians are the soldier heroes in this war, if they do not run

away but face the danger, greater than in battle. We had expected the cardinal's hat for the Archbishop, who had served honestly and faithfully, if not always wisely, as the Papal Delegate in Cuba and the Philippines. He will have a higher honor in the memory of the city of which he was a most distinguished citizen and of the Church of which he was a high prelate.

John M. Poag was an American martyr. He was a sheriff, and every sheriff and every policeman should be ready to be a martyr. He had charge of the jail at Senatobia, Miss., and a mob of masked men came to take out a prisoner charged with murder. He believed in doing his duty and declared that no mob should take a prisoner from under his charge except over his dead body. So he defended the jail and was shot and killed. The people of Tate County propose to raise a statue to his memory, and they ask help from sheriffs and others the country over for the statue. Sheriff Poag's example was of priceless value and the blood of that martyr will be the seed of justice in a land of lynch law.

They say that the signing of the Declaration of Independence was hastened by the mosquitoes, which annoyed the members of the convention so much that they were in no mood for longer deliberation. Will the mosquitoes at Portsmouth produce a like effect in accelerating the signing of a treaty of peace? Now that we hold mosquitoes responsible for so much evil, it would be pleasant if we could credit them with doing a little good in the world.

Archbishop Harty gave a great dinner to Secretary Taft and his party of visiting Americans. That was well. Those islands are Catholic in religion, and Archbishop Harty is their highest ecclesiastic, and an American citizen. The ecclesiastic and the civilian, the head of the Church and the representative of the nation, did each other equal and worthy honor.

Insurance

The Supervision of Life Insurance Companies

The affairs of the Equitable and other recent sensational disclosures in the business of life insurance have aroused a wide popular interest on the part of those who are insured as well as those who are not thus protected. Public attention because of this has been attracted and focused upon the methods of supervision employed by the insurance departments of the several States. In this connection an article in *The North American Review* for July, by S. Herbert Wolfe, an actuary, who has conducted many examinations on behalf of various State insurance departments, has much interest by reason of the authority with which Mr. Wolfe speaks. As Mr. Wolfe very forcibly points out in his paper, a great defect of the present system of insurance supervision in the United States arises from the circumstance that in each State the supervising officer is a part of the political machinery of his own State. Because of this and of the fact that the office is far too frequently bestowed as political spoil it comes about that men of no technical equipment, or with an equipment that is totally inadequate, are placed in control of investigations which demand special training and much experience. The present conditions have outgrown the laws framed before the enormous development of the insurance business took place. Whatever else may be the result of the Equitable dissensions, certain it is that by attracting the attention of the people to prevailing conditions in the insurance world it is exceedingly possible that much good may ultimately result therefrom. The question of investments is another matter to which Mr. Wolfe has directed particular attention to good purpose. He strongly deprecates the control of subsidiary companies by giant insurance concerns. He has made it clear that if the supervision of insurance companies is to be worth anything the time is close at hand when more rigorous standards must be established that shall

safeguard the interests of policy holders more after the fashion whereby depositors in savings banks are protected. The only thing now needed to effect so desirable a transformation from what is to what ought to be is the realization on the part of the policy holder of the necessity for it.

CERTAIN changes have recently been made in the rulings of the Post Office Department which will have an important bearing upon the business of the so-called wildcat insurance companies. For a long time it has been the custom of the Post Office Department to remain blind to the acts of fraudulent insurance concerns until complaints from victims accompanied with facts and data were received, upon which proceedings might be based whereby the wildcatters could be excluded from the use of the mails. The new regulation emanating from the Postmaster-General will materially facilitate proceedings undertaken against those offering wildcat insurance to purchasers. It requires post office inspectors to take action in all cases where they know of existing fraud, as well as in cases where newspaper advertisements lead them to suspect it. Where the use of mails is denied to suspected persons it will devolve upon them to produce evidence showing that the suspicion was not well founded. The action of the Department is a step in the right direction, as the unrestricted use of the mails is vital to the business of the insurance impostor.

....The adoption or at least the careful testing of automobile fire engines was recently urged upon the Philadelphia Fire Department by the *Public Ledger* of that city. Such engines are now satisfactorily used in New York, Boston and Hartford, and why not in Philadelphia?

....The Supreme Council of the Royal Arcanum, yielding to the widespread demand, will hold a special session at Put-in-Bay, Lake Erie, the last of this month. The rate question will have consideration.

Financial

More Favorable Crop Reports

THE Government's August crop report (published on the 10th) is even more favorable than the report for July. It points to a crop of 2,698,000,000 bushels of corn, or the largest on record, against last year's harvest of 2,467,480,000. The yield of wheat will be 709,731,000 bushels. Last year's was only 552,400,000. Minor cereals are in good condition, each of them promising an increase. Corn is not yet out of danger; wheat is safe. In the last fiscal year our exports of wheat (including flour in terms of wheat) were only 43,797,000 bushels, against 120,000,000 in 1903, and an average of more than 210,000,000 for the six years preceding. Exports in the coming year may be from 175,000,000 to 200,000,000. It should not be forgotten, however, that the very large crop in the Canadian Northwest will yield a heavy surplus to be sold abroad.

New York's Telephone Service

THE Merchants' Association of this city, in April last, took up the subject of telephone rates and service with the New York Telephone Company, intending to bring about a reduction of the rates if they were found to be excessive. A special committee was appointed, consisting of Clarence Whitman, chairman; J. Crawford McCreery, John C. Eames, Herman A. Metz and Frederick B. De Berard, secretary. To this committee the company agreed to furnish every facility for a thorough inquiry. It also undertook to readjust its rates in accord with an equitable basis of profit, mutually accepted, if such a readjustment should be warranted by the facts disclosed. The inquiry was made, with the assistance of financial and electrical experts, and the company then reduced its rates, adjusting them to the basis as to which an agreement had been reached. This involved a reduction of \$1,525,000 in annual revenue. It was a notably successful undertaking on the part of the Merchants' Association, and the management of it as well as the final result

have been highly creditable to both the Association and the Telephone Company.

The committee's report, with accompanying papers, has now been published in a handsome volume which is a contribution of enduring value to what may be called the literature of such investigations. The limits of our space will not permit us to set forth in full its reasoning and conclusions, but the report as a whole is a model of its kind, conservative, effective and in accord with the established principles of enlightened commercial practice. For sixteen years ending with 1904 the average annual net earnings upon the investment were 11.12 per cent., but in 1904 the net was 14.64 per cent. It had been agreed that 10 per cent. was reasonable, and the reductions were made without delay to accord with that accepted basis. Among the subjects considered, and as to which the committee's conclusions are expressed, are investments, comparisons with other cities, replacement outlays, reasonable margin of profit, graded charges for service and the method of recording calls. The committee argues against the expediency of competition and opposes a regulation of rates by law so long as proof is shown that they are reasonable in their relation to the cost of service. It has been convinced that the service under examination is not surpassed elsewhere in adequacy or efficiency. This is the largest municipal telephone system in the world. In the boroughs of Manhattan and the Bronx (Brooklyn is excluded) there are more than 150,000 telephones. London has less than 100,000, Paris about 50,000, and there were 67,000 last year in Berlin.

OUR exports of cotton cloth to China increased from about \$4,000,000 in the fiscal year 1904 to \$27,750,000 in the year ending with June last.

....The People's Trust Company of Brooklyn, of which Edward Johnson is President, in its statement issued July 1st shows resources of \$17,832,006. The capital and surplus are \$2,700,000, and the deposits exceed \$15,000,000.

The Independent

VOL. LIX

NEW YORK, THURSDAY, AUGUST 24, 1905

No. 2960

Survey of the World

The Situation on the Isthmus

Digging has been almost wholly suspended on the canal route and may not be resumed until several months hence. In the meantime all hands will be engaged in preparatory work that has been neglected. Chairman Shonts and Commissioner Ernst returned from the Isthmus last week, and the Chairman talked freely about what he had found there. To some he even said that a year had been lost by a bad beginning. His inspection of the route showed that little or no provision had been made for housing or feeding the employees. The price of food was very high. Eggs were selling at 10 cents apiece. All of a laborer's wages was required to pay for his meals. Railway tracks for use in the cuts were sinking in the mud; the dirt taken out by steam shovels could not be carried away. At the railway terminals there was a great congestion of freight. The situation was a disheartening one, and the Zone was inhabited by thousands of dispirited men. Therefore the work of digging was suspended, and Mr. Shonts set out to make proper provision for the employees. Houses and hotels are to be erected. Supply trains are now running every day to the camps, and numerous commissary stations have been established, against the protests of native merchants. Orders for more laborers were promptly countermanded; there will be no increase of the force until the preparatory work is done. By the use of modern railway methods the congestion of freight may be relieved within thirty days. In one interview Mr.

Shonts says that he didn't want the office he now holds. It was at first proposed, he says, that he should share the responsibility with Judge Magoon, but he insisted upon taking it all himself, and, to his surprise, Mr. Roosevelt accepted his terms. He had no disagreement with Chief Engineer Wallace except with respect to the inadequate preparations for housing and feeding the employees. Wallace said this work could be done later. Judge Magoon agreed with the Chairman in holding that it should have been done at the beginning. The present Chief Engineer, Mr. Stevens, accepted the place, Mr. Shonts says, upon condition that he should have only one boss.—W. E. Dauchy, engineer in charge of the Culebra division for the past year, has resigned. He was appointed by Wallace. The Advisory Board of Engineers will hold its first meeting in September.

Reform in Philadelphia

In obedience to the commands of Mayor Weaver's new Director of Public Safety, the police of Philadelphia recently made an inquiry to ascertain the number of fictitious names that had been placed on the voting lists of that city. Their reports showed 31,817. They were directed to go over the ground again, and now their second investigation shows 60,083 fraudulent registrations in a total of 375,812. In the Third Ward the fraudulent (3,284) outnumber the genuine (2,705); in the ward controlled by McNichol, Boss Durham's partner in contracts, the fraudulent (3,970) were 42 per cent. of the entire number. With

the aid of these lists, it has been customary for the Republican organization leaders to count about 80,000 fraudulent votes at an election. Some years ago the city, by a large majority, asked for a personal registration law but could not get one from the State Legislature. Republican leaders in the State are now talking of asking for a special session of the Legislature for the enactment of such a law and for the repeal of the "ripper" laws recently passed, which were designed to strip the Mayor of Philadelphia of his powers.—The Councils, composed mainly of members elected by the ring with the aid of these fraudulent lists, appear to be regaining the courage which they lost when the popular revolt compelled a withdrawal of the gas lease. By a vote of 32 to 5, last week, the Select Council adopted resolutions, introduced by a law partner of the deposed Director of Public Safety, providing for an investigation concerning the recent removals of public officers by Mayor Weaver and asserting that these removals were made "for political reasons." This action is commonly believed to have been suggested by United States Senator Penrose, and the resolutions were introduced by his personal representative in the Council, in whose ward 2,243 fraudulent registrations were found. All of the seven members of the investigating committee are representatives of what the Philadelphia newspapers call the "Gang," the President of the Council who appointed them having been nominated for Sheriff by the Durham-McNichol organization before the reform revolt began. At the same time, the Finance Committee recommended, in defiance of the Mayor's expressed wish, the negotiation of a loan of \$4,000,000 for the removal of grade crossings, altho there was about \$2,000,000 on hand available for this purpose. Mayor Weaver promptly responded to the appointment of the committee by saying, in a letter to its chairman, that this was just what he wanted. Pointing out that unlimited powers had been granted to the committee, he insisted upon a searching investigation of every branch of the municipal Government, adding that he desired to attend every meeting and to offer all the evidence he had obtained as to the con-

struction of the filtration beds, the new boulevards, etc. It is thought in Philadelphia that he is offering more than the committee desires to receive and use. The discovery has recently been made that the Mayor's predecessor, Mayor Ashbridge, signed a contract making a brother-in-law of Boss Durham architect for \$8,000,000 worth of projected hospitals and other public buildings.

Similar Movements Elsewhere This revolt in Philadelphia has caused uprisings against ring rule in some other parts of the State. Chester County, which is near the city, has been controlled by a Republican machine organization under the direction of a politician named Eyre. Owing to a formidable protest of independent Republicans against the machine, the Eyre County Committee somewhat unexpectedly came over last week to the support of reform, adopting resolutions commending Mayor Weaver and calling for the repeal of the ripper laws and the enactment of a personal registration law at a special session of the Legislature. At the meeting, Mr. Eyre spoke in advocacy of the resolutions. A county ticket recently nominated was withdrawn and overtures to the independents for joint primaries were made. These overtures were rejected. At an all-day mass meeting of the independents, on the 18th, eloquent addresses were made by Ex-Attorney General Wayne MacVeagh, Ex-Postmaster General Smith and Mr. Niles, formerly president of the State Bar Association. Mr. MacVeagh urged his hearers to make no compromise with the Eyre Republicans, but to keep them on the run. The State Republican organization, he said, was a corrupt and criminal organization masquerading as Republicans. As a lawyer, he deplored the errors of some members of his profession who had given opinions to be used against Mayor Weaver and also to assist Eyre in this county. The following "literally true" story had been told to him:

"One of the grafters in St. Louis whom Mr. Folk succeeded in getting into the penitentiary—ours are not there yet—when visited by a friend in his cell was asked:

"Now that you see, John, the awful consequences of your course, would you again accept a bribe for your vote, if you had it to do over again?"

"John answered promptly: 'Certainly not. I would be a lawyer and take the bribe as fees.'"

Mr. Niles sharply denounced the State Republican organization and attacked "Republicans of the baser sort, unfortunately known as the Pennsylvania brand," who had "blackmailed useful corporations by threat of unjust legislation and sold the people's rights, for bribes, to lawless aggregations of criminal wealth."—In Lehigh County a Taxpayers' League is suing the County Commissioners to recover a large sum paid out on contracts alleged to have been given to persons representing the concealed interest of one of the Commissioners and the Sheriff.

National Topics

It is now understood that there will be no extra session of Congress. Some months ago, the President intended that there should be one, beginning in October, for the consideration of the railroad rate question. More recently it was his purpose to call a session for November 13th, but he has since reached the conclusion that nothing could be gained by requiring Congress to assemble three weeks before the beginning of the regular session.—The Interstate Commerce Commission has begun an investigation as to the private car lines and their relation to certain railroad companies. These companies and the corporations owning the private cars are required to answer complaints that the agreements relating to the use of such cars cover the payment of unlawful rebates. The Commission intends that the proceedings shall show whether the present law is sufficient for the restraint of the private lines.—Reports from Delaware say that J. Edward Addicks has lost the support of the Union Republican organization and that notice to that effect has been given to him by Senator Allee, chairman of the Union committee and formerly his chief lieutenant.—Director Walcott, of the Geological Survey, de-

nies that any information obtained by the Survey has been sold or given, in advance of general publication, to any journal or person.—As a result of an official inquiry, several inspectors heretofore employed in examining fur gloves and caps bought for the army at the Schuylkill Arsenal in Philadelphia have been suspended. It is asserted that bribes were paid by contractors and that goods of poor quality were accepted.—Some time ago, the claims of France against Venezuela, for damages sustained by French citizens doing business in that country during the insurrection of 1901, were referred to Judge Frank Plumley, of Vermont, for final adjudication. They amounted to \$8,500,000. His awards, announced last week, give the claimants \$653,000.

Cuban Legislation and Politics

Recent events in Cuba indicate disregard for the advice of our Government and for some of the restrictions of the Platt Amendment. The bill, passed some time ago in the House, increasing the duty on rice from \$1.20 to \$2.75 per 100 kilos (220 pounds), was rejected last week in the Senate by a vote of 11 to 2. Its purpose was to give to Louisiana the Cuban market for rice, which is now supplied mainly by European exporters. After the proposed increase of duty, Louisiana would have had a considerable advantage, owing to the percentage reduction which is required by the treaty of reciprocity; but the cost of the rice consumed in Cuba would have been increased by about \$500,000 per annum. It is asserted that the bill was supported by our State Department and by Minister Squiers, and that President Roosevelt sent to President Palma a letter favoring the passage of it. The Senate passed the bill (recently passed by the House) providing for an issue of \$28,500,000 in bonds for the payment of the remaining claims of the soldiers of the revolution. Altho the majority fell short of two-thirds of all the members (which the Constitution requires for loan legislation), it is said that President Palma

will sign the bill. It is also required by the Constitution that in such cases Congress shall specifically assign permanent revenue for interest, but there is no provision of this kind in the bill. Some think the bill is at variance with the requirements of the Platt Amendment. An annual subsidy of \$266,000 for three years to the new railway from Havana to Santiago has been granted.—Governor Nuñez (of Havana province), the Nationalist leader who left the Fusion party after the nomination of Governor Gomez for the presidency, has entered into an agreement with the Moderate party, whose candidate is President Palma. The Nationalist vote is to be cast for the Moderate candidates, but Nuñez is to be consulted as to the second place on the ticket, is to be the joint nominee for the office he now holds, and will be permitted to name half of Havana province's candidates for the Senate and the House. This compact related also to the office of Mayor of the city. Mayor O'Farrell had been deposed and Señor Bonachea was acting in his place. After a time he was elected by the Council, but this election he annulled because he had not received a majority of all the votes cast. Then Señor Nodarse, a Moderate, was elected. Bonachea, however, had been the choice of Governor Nuñez, and on the 16th President Palma issued a decree making him Mayor, thus overruling Bonachea's own decision and annulling the subsequent election of Nodarse. It is expected, the dispatches say, that as a result of this action, a combination of Nationalists and Moderates will control the city and the province at the Presidential election.

Secretary Taft in the Philippines

At Iloilo, Secretary Taft and the legislators accompanying him had several conferences with the sugar planters. Their investigations showed, it is said, that the Philippine sugar was of an inferior quality and could not compete with the sugar of the States on even terms. The local Chamber of Commerce asked for the abolition of our tariff on Philippine products and a reduction of

the new internal taxes, saying that wages had been trebled since 1896, while production had decreased and there had been only a slight advance of market prices. Therefore many planters had ceased to produce sugar. At a banquet two natives urged that there should be given a promise of early self-government, to be followed by independence. In reply Secretary Taft said that the Government would not tolerate interference with its policy of preparing the Filipinos for self-government. Several generations would be required for this preparation. He advised the people to go to work and to avoid political agitation. Senator Scott urged them to respect the United States flag; it would protect them for a hundred years during the development of the islands. From Iloilo the visitors went to Negros and thence to Mindanao and Jolo.—At Manila the Federal party has accepted the Secretary's statement of the Administration's attitude toward the islands and will reconstruct its platform in accordance therewith.—Extensive preparations have been made for the reception of the tourists at Hong Kong and Canton from the 3d to the 6th of September. The Dowager Empress desires that Miss Roosevelt shall come to Peking.—To the planters of the Hawaiian islands, who asked for the admission of 50,000 Chinese laborers for a period of 5 or 10 years, the Secretary said that the Government did not favor a relaxation of the existing statutory provisions against the admission of Chinese of that class.

Labor Disputes

The telegraphers on the Northern Pacific and Great Northern roads, who went on strike August 1st, have surrendered. About 1,750 quit work. The strike was ended by official order on the 19th, and a majority of the men resumed work at the old wages. Agitators were excluded by the companies, and the non-union men employed in strikers' places were retained.—At last week's meeting in Toronto, the International Typographical Union adopted the report of its committee recommending that on and after January 1st next the union insist upon an eight-hour day. The

meeting was addressed by the President of the United Typothetæ, who gave notice that the proposed change would be opposed in every legitimate way by the employers.—At the end of the strike of the Hebrew bakers in New York, last week, both sides claimed a victory. Higher wages were granted, but a majority of the employers now have the "open shop." About one-third of them have signed agreements with the union. This strike has directed attention to the unhealthful conditions under which these bakers work and to the fact that many of them die of tuberculosis. Labor Commissioner Sherman complains that he has not enough inspectors for the work of examining the shops and enforcing the laws.—The trolley employees in New Haven have asked for a wage increase from 21 to 25 cents an hour, and the company has refused to give it. This trolley system, with those at Hartford, Springfield and several other cities in Southern New England, is now owned by the New York, New Haven & Hartford Railroad Company, which exercises control through the agency of a subsidiary corporation.

The Chinese Boycott

At the end of last week, according to dispatches from Peking, our Government gave notice to China that all negotiations for a new Exclusion treaty would be discontinued pending a discontinuance of the boycott of American goods; also that China would be held responsible for loss sustained by reason of the boycott. Reference may have been made to the provisions of the Tientsin treaty of 1858 concerning the right of American citizens to sell goods in China. Edwin H. Conger, now Ambassador to Mexico, who was Minister to China for eight years and until a few months ago, will go to China as a Special Commissioner to inquire concerning the boycott, the negotiations for a treaty and the concession, held by an American company, for the projected Canton-Hankow Railway. Mr. Conger earnestly objects to the proposed surrender of this concession to China for \$7,000,000, saying that it would be a blow from which American

prestige in the Far East would not in many years recover.

The Peace Conference

The plenipotentiaries of Russia and Japan at Portsmouth have discussed in detail each of the twelve articles in the conditions proposed by Japan, and have come to some sort of an agreement on eight of them, but the other four, relating to Sakhalin, the payment of indemnity, the surrender of interned ships and the limitation of Russia's naval power, have been positively rejected by the Russian envoys, and at the time we go to press there is no evidence of a concession coming from either party. Sessions were held regularly during the week, twice a day, often lasting several hours, and after the consideration of the separate items, the terms as a whole were discussed on Friday, August 18th. Finding that the deadlock was not to be broken by further argument the Conference adjourned to meet Tuesday, August 22d. On Friday night President Roosevelt telegraphed to Portsmouth that he wished to confer with a Russian representative, and on Saturday Baron Rosen, who is the Russian Ambassador to this country as well as one of the peace envoys, visited Oyster Bay and spent nearly two hours with the President. Baron Keneko, who has resided in New York during the war as the financial agent of the Japanese, had previously paid several visits to Oyster Bay, from which it is inferred that President Roosevelt is exerting a strong personal influence to bring about an agreement. Both the Russian and the Japanese envoys have preserved a strict silence in regard to the proceedings, and the newspaper correspondents who swarm about the Hotel Wentworth are obliged to construct their voluminous dispatches out of such meager hints and suggestions as they can extract from the delegations and their unofficial *attachés*. The general nature of the clauses agreed upon and the points of difference are, however, pretty well known. The status of Korea and Manchuria, the direct cause of the war, was embodied in the four first articles, which were quickly adopted. Article I provides that Russia shall recognize Japan's preponderant influence

in Korea and her right to preserve order in the civil administration and to give military and financial advice to the Emperor of Korea, and that the territorial integrity of Korea shall not be infringed upon by Japan. In Article II both parties agree to withdraw their troops from Manchuria simultaneously. Articles III and IV provide for the restoration of the civil administration of Manchuria in accordance with the pledges made by Russia to China in the treaty of April 8th, 1902, and the maintenance of the "open door." By Article VI Russia transfers to Japan all the Russian property and leases on the Liao-Tung Peninsula, including Port Arthur, Dalny and the Blonde and Elliott Islands. Articles VII and VIII, relating to the Chinese Eastern Railroad, was agreed upon in the main after long discussion and some compromise on both sides. The southern branch of the railroad, running from Port Arthur, Dalny and Niuchwang to within ten miles of Harbin, is to be under the control of the Japanese, and the branch running through northern Manchuria and connecting Harbin with Vladivostok is to remain under the control of Russia, but Chinese imperial police are to be substituted for the Russian railroad guards. Japan agrees to protect the financial rights of all private owners of property and investors in railroads and franchises. Article XII grants to citizens of Japan the right to fish in the waters of the Russian littoral from Vladivostok to Bering Sea. All the above conditions have been accepted by Russia, but Mr. Witte declares that the loss of territory and payment of an indemnity involve such a sacrifice of national honor that Russian people will prefer to continue the war. In regard to Article V, relating to Sakhalin, it is argued that Japan had never colonized the island previous to its occupation by the Russians, and that Japan surrendered her claims to Russia over thirty years ago, and that it is not one of the points at issue in the war. Article IX, providing for the remuneration of Japan for her expenditures during the war, is refused on the ground that Russia is defeated, not conquered, and that she has never in all her history consented to pay an indemnity to a victorious Power. Mr. Witte says that Russia is willing to

pay liberally for the care of the Russian prisoners and wounded in Japan and all similar expenditures. In Article X Japan asks for the surrender of the Russian warships which have escaped from battle and have been interned in neutral ports, but not for those, such as the "Lena," at San Francisco, which have not actively engaged in the war. This is rejected as well as Article XI, which limits the naval force which Russia may keep in the Pacific.

The Russian Assembly

The plan for a national assembly, which was devised by the Commission under Minister of the Interior Bulygin and has been for a long time under discussion by the Council of the Empire in the presence of the Czar, was officially promulgated by an imperial manifesto on August 19th, the Feast of the Transfiguration. The new assembly will not be a zemsky sobor, such as in the early days of the empire used to regulate taxation and expenditures and even elect Czars, but a Duma, a purely advisory body, which may discuss and make recommendations upon such subjects as may be submitted to it and may call the attention of Ministers and chiefs of departments to infractions of existing laws. The questions to be discussed are to be submitted to the Duma by the Ministers and chiefs of departments, who may withdraw a bill at any time and who may attend the sessions to make explanations, but they are not entitled to vote in the Duma and are not responsible to it.

"The competence of the Duma shall extend (a) to all questions relating to new laws and the modification or amplification and temporary suspension or appeal of existing laws; also to making or altering appointments to the staffs of the Ministries and to the expenditure thereby involved; (b) to departmental, ministerial and national budgets and to other expenditures not provided for therein; (c) to the financial report of the Comptroller of the empire; (d) to the expropriation of any portion of the revenue or property of the State; (e) to the construction of railways by the State; (f) to the organization of stock companies involving exceptions from existing legislation; (g) to matters submitted to the Duma by imperial decree."

All bills passed by the Duma go to the

Council of the Empire, which is also an advisory body of functionaries, active and retired, and which has proved to be of very little force or independence of action. The Council reports its decisions and those of the Duma to the Czar, who has the right to adopt either the majority or minority report or to disregard them both. If the Duma and the Council disagree the bill is considered in joint session. A bill passed by a majority of two-thirds of the Duma is referred to the Czar, even tho it is disapproved by the Ministers in charge of the department concerned. The Duma is to be called and adjourned by the Czar. The members will have absolute freedom of expressing their opinion on matters within the competence of the Duma. The members will receive \$5 a day and traveling expenses, to be paid from the imperial treasury. Members are elected for a term of five years by a somewhat complicated system manifestly intended to cut down to the minimum the representation of the peasants and to exclude the city workingmen. The total membership of the Duma will be 412, of which 28 are to be returned by the towns. Elections may be held: First, in the provinces and territories; second, in the principal towns, which are named. In Poland, Siberia, the Caucasus, Turkestan and some provinces special regulations will govern the elections. The elections in the provinces and territories will be effected by a provincial electoral college, chosen, first, by the land owners; second, by urban electors, and, third, by delegates of the peasantry. Women, men under twenty-five years of age, students, sailors, soldiers, bankrupts and persons convicted of crimes or desertion shall not have the right to vote. Governors and the police cannot vote when exercising their functions. Land owners, mine owners and owners of industrial establishments of a minimum value of \$7,500 and clergymen owning lands are qualified to vote in the electoral assemblies. For the urban electoral assemblies owners of land of a minimum value of \$750 and owners of industrial properties of the first category are qualified. The peasantry electoral assembly shall consist of two delegates from each canton, chosen by the peasants belong-

ing to the cantonal and agricultural corporations. In cities, which are named, owners of real estate of the value of \$1,500 and owners of industries of the first category and persons paying taxes or rent of the tenth category are qualified to participate in the electoral assemblies. The urban and provincial assemblies will vote for deputies to the Duma by secret ballot, which also applies to the subsidiary elections. The first meeting of this Gosudarstvennaia Duma, or Lower State Council, will be held in January, 1906. This new Duma, since it has no real power and is based upon a suffrage limited to less than five per cent. of the adult male population, does not in any respect meet the demands of the Russian Liberals as expressed in the Zemstvo Congress, which adjourned the last meeting at Moscow with the determination to assemble after the promulgation of the imperial scheme for a national assembly for the discussion of its provisions and to decide whether they should approve of it or continue their agitation for a larger share in the Government. But the Czar has prohibited all discussion of the project, and the zemstvoists will not be allowed to assemble either in public or in private.

The Andalusian Famine

Distress and disorder on account of the failure of crops in Spain still continue and increase notwithstanding the official and personal efforts made to alleviate it. The greatest suffering prevails in Cadiz and Sevilla and in other farming communities of southern Spain. Bread riots occur frequently and bakeries and the houses of rich farmers are looted to obtain food. Thousands of laborers are kept from starvation only by the eating of wild roots. The Governor of Cadiz has telegraphed the Government that he cannot be responsible for the peace of the rural districts unless public works be inaugurated. Señor Romanones, the Minister of Agriculture, is doing what he can to supply food to the famine sufferers, but admits that the relief will be insufficient and only temporary. The real difficulty is traceable to the faulty methods of agriculture which have prevailed for centuries. Per-

manent relief can only be effected by Government irrigation works, and appropriations for the establishment of these he will ask of the Cortes when it assembles on October 11th. In an interview Señor Romanones makes the following very frank statement in regard to the situation:

"As Minister I am bound to declare that public order must be maintained, but if I were a laborer I should talk differently. The fact is the Government is systematically opposed by the landlords whenever it tries to carry out a work of general utility. The approach of the elections makes my position more difficult."

He has requested the railway to commence the work of repair and construction on all lines to give employment to the greatest possible number, and the Andalusian authorities have been ordered by the Government to start public kitchens for the supply of food to the starving.

Lord Curzon Resigns

The India Office has just published a White Book giving the correspondence between the India Office and the Viceroy in regard to the army administration, from which it appears that Lord Curzon cabled his resignation as Viceroy of India to the Government on August 12th, and that it was accepted. The difficulty arose from the complaints of Lord Kitchener, Commander-in-Chief of the forces in India, that he was hampered in his management of the army because he was under the control of the Viceroy's Advisory Council and subordinate to the Military Member of the Council, an officer of inferior rank, who used his own discretion as to the granting of supplies and ammunition demanded by Lord Kitchener. He protested that it was impossible for him to carry out his commission for the reorganization of the army so long as he was not given a free hand. This dual system of control might paralyze the Commander-in-Chief at any moment when the empire was in peril, and he proposed that the Commander-in-Chief be made Military Member of the Council. Lord

Curzon objected to this and proffered his resignation, but a compromise was arranged by which the powers of the Commander-in-Chief were increased, and the Military Commander of the Council was replaced by an official of less authority, with the title of Military Supply Member. For this post Lord Curzon recommended Major-General Sir Edmund Barrow. Mr. Brodrick, Secretary of State for India, refused to make this appointment on the ground that General Barrow was out of sympathy with the new arrangement and would not give it a fair trial. Premier Balfour pointed out to the Viceroy that the choice of members of the Council rested solely with the Secretary of State, saying:

"No greater violation of the Constitution can well be imagined than that this duty should degenerate into a merely formal submission to His Majesty of the views and recommendations of the Viceroys."

Whereupon Lord Curzon expressed his positive determination to resign in the following words:

"The main question is not the choice of individuals, but one of the principles underlying a future change in our administration. I am reluctantly driven to the conclusion that the policy of His Majesty's Government is based on principles that I could not conscientiously carry into execution. In the interests of the new organization it is desirable that I should be relieved of my duties with as little delay as possible.

"I loyally commenced the undertaking, and only resigned when I realized that conflicts were certain to arise between the Commander-in-Chief and the rest of the Government of India.

"I reflect with sorrow how little justification there has been for the claim you make of having rendered me your constant support."

His successor is to be John Elliott Gilbert, fourth Earl and Baron Minto. Lord Minto was born in 1845, and educated at Eton and Cambridge. He served as Secretary to Lord Roberts in South Africa in 1881, and in 1883 to Lord Lansdowne, Governor-General of Canada. Lord Minto was Governor of Canada from November 12th, 1898, till December 10th, 1904.

The International Parliament

BY COUNT ALBERT APPONYI

(MEMBER HAGUE COURT AND OF HUNGARIAN PARLIAMENT)

A FEW years ago the people of the United States lived in tranquil self-contentment, far away from the contests and complications of world politics. They had none the less a strong influence on the destiny of mankind by the moral force of their liberal and democratic institutions, which excited admiration and envy among less happily situated nations, notwithstanding the malignant watch which the spirit of reaction kept on every unpleasant feature in their practical working. This moral influence paved the way for a more direct participation of America in the common life of all civilized nations. When the moment for such participation arrived, when the powerful organ of the United States began to be heard in that discordant tumult of voices which is euphemistically called a "concert," it was hailed by all friends of liberty and of fraternity among nations with an unanimous outburst of confidence and of sympathy. We all felt assured that America, tho keenly watching her own interests, would upon the whole throw her weight into the scale of international justice and of peace. Nor were our hopes deceived. The representative man of that new evolution in American politics, the President who has been elected in the sign of this new departure, whose unparalleled victory may be called a plebiscite in its favor, has held such language, and, what is more, has lived up to it, as to give the lie to skeptics and high hopes to right believers. When President Roosevelt said, in the magnificent speech delivered after his election, that there is no Power so strong as to make America afraid of it, and no nation so weak as to have any reason to fear her, he laid down in a few words the program of a great nation which will neither suffer nor do injustice. And when he was the first one to bring an international con-

test before The Hague Court, when he took the initiative for a peace congress, when he keenly watched and resolutely grasped the first opportunity for a successful intervention on behalf of peace between Russia and Japan, he gave us to understand, through these facts, what humanity has to expect from a more frequent participation of America in her general affairs.

Democracy can have but one sort of foreign policy: Boldly to uphold the banner of international justice and fraternity. She may make ready for self-defense; this is a tribute she must pay to an unsatisfactory state of things which cannot be put away with a wave even of her powerful hand; but the spirit of aggression is in contradiction with her very nature, while the love of peace and of justice are essential ingredients of her mental complexion. The Star-Spangled Banner then, in its present powerful display, symbolizes better days for mankind.

American activity, whether in private enterprise or in public business, is characterized by a bold energy, by a go-aheadness, which sometimes takes the breath away from us more easy-going and more circumspect Europeans. It is a ferment of acceleration everywhere, and it is most beneficially felt as such in the case of the peace movement. Since America participates in that movement, we Europeans feel, as it were, emboldened to stride with larger steps toward our ultimate aim.

The meeting of the Interparliamentary Union for arbitration held last year at St. Louis marks a date in the history of that institution. At this meeting our American friends moved a direct appeal to the first magistrate of their country on behalf of a new Peace Congress; and never shall I forget the impression which President Roosevelt's clear and straightforward answer to that appeal made on us Eu-

ropean delegates when we heard it from his own lips in the White House. Accustomed as we are to the circuitous and oracular language which even the smallest agent of public power is wont to use in our countries lest he should commit himself to any decided course of action, taught to consider such affectation of cautiousness as an essential attribute of statesmanship, and to listen to such official stuff with a reverential awe, proportioned to its degree of unintelligibility, we felt something like a breeze of fresh air when the first magistrate of a powerful nation, on being asked by a society of idealists to take a delicate and bold initiative, answered, "Yes, I shall do it," in language of quite biblical simplicity. The sweet feelings of success, success clear and undeniable, not vaguely to be constructed by artifice of interpretation, which may prove misleading after all, but granted to us in plain, unmistakable words, filled our breasts with new hope and with a firmer belief in our cause. Those three weeks spent in the United States and that hour spent at the White House had a most invigorating effect on our souls. We had breathed American air, our lungs became dilated by it for the steep ascent still expanding before us.

But now our American friends are urging us on at a pace which it will be hard for some of us to keep. The American Group of the Interparliamentary Union proposes a motion for this year's meeting to be held at Brussels in August to the effect that all civilized nations should send delegates to a permanent International Congress—mind, a Congress—not a private meeting of men, holding a public position, indeed, but unprovided with an official mandate and wielding therefore no power but the moral force of their conviction and of their influence, but a body of official delegates, sent by the popular branch of their respective public Powers, invested with a mandate which gives legal force to their decisions.

The boldness, the magnificent radicalism, of that idea fills our souls with an admiration from which, alas! skepti-

cism is not absent; it wholly depends on the particulars of the scheme which of the two feelings shall ultimately prevail. I suppose that International Congress is meant to be a sort of legislative assembly for questions of international law, a popular complement to the present organization of diplomatic congresses which decide on these matters. This new organ is intended to do business, not occasionally, as diplomatic congresses are now wont to meet for the readjustment of things after some catastrophe, but periodically, for the laying down of permanent general rules of international law, the application of which would belong in the executive sphere to diplomacy and in the judicial sphere to international tribunals of arbitration. In its broad outlines I can see before me the matters to which the congress might extend, and I fully appreciate the utility of its introduction into the machinery of international legislation. Its periodicity would mean legal prevention of conflicts instead of a mere legalization of their consequences; its popular character would go very far to make principles of universal justice prevail over combinations of temporary expediency. Upon the whole, its realization would mean an immense step in advance toward the ultimate goal of general brotherhood.

What I see less clearly and where the chief difficulty lies is to define the amount of legal force which the decisions of such a congress shall be possessed of and the means of practically enforcing them. And here I warn our American friends of being misled by a fancied analogy between such an association of nations and the union of States in their great Republic. These States were never sovereign Powers till the movement which gave birth to their union at the same time and through the same instrument which proclaimed their emancipation; they have not behind them a history of feuds and antagonisms centuries old; their interests do in the main coincide; their particular mentality is immersed into a stronger feeling of broad American patriotism; their constitution makes the popular

assemblies paramount in legislative power, and the agents of executive power, up to the highest one, entirely dependent on the people's will. In Europe you have to reckon with conflicting national histories and mentalities, and with constitutions widely different between themselves and almost all of them much less democratic than the Constitution of the United States. The International Congress as proposed by the American Interparliamentary Group will have to reckon, in Europe, with a double difficulty, a vertically and a horizontally laid one, if I may so express myself, the former arising from the strength of monarchical prerogative in most European constitutions; the second from an energetic consciousness of independent sovereignty pervading all European nations. Neither will the monarchs be found willing to abdicate their privileges in foreign affairs, considered as their own domain through centuries, or even to share them to any large extent with a newly created International Parliament, nor will the national legislatures be inclined to fetter the absolute independence of their decisions by conferring on an international assembly the power to overrule and to control them in certain questions. I very much doubt whether even the United States, as a nation, would feel inclined to admit such a Power, placed in some respects above them, setting up limits to their national sovereignty.

Now I don't mean to say that these difficulties are not to be surmounted; what I intend to state is only this, that no scheme has any chance of practical realization which does not solve them one way or other. For this purpose you must either be content to give to the resolution of that congress moral weight only, or you must be ready to meet some arduous preliminary questions, which I shall try to indicate directly. In the former case the motion means practically a more elaborate and effective organization of the Interparliamentary Union for international arbitration. I should consider even this as a great step onward, since it is self-evident that a body of delegates, with a

mandate from their respective Parliaments, will carry greater moral weight and will have more influence at home than a gathering of men with nothing to lean upon but their individual good will. In the second case, if jurisdiction of some sort is to be vested in that International Parliament, you must begin by examining and defining:

1st. The relation in which it is to stand to the heads of States and their diplomatic representation, as acting individually or jointly as a congress;

2d. The questions which shall fall within its competence;

3d. The mode of its composition—namely, whether all nations shall send an equal number of representatives (as follows from the principle of sovereignty) or whether their representatives shall be proportioned to the population of each;

4th. The mode of passing resolutions; will unanimous consent be required or will the minority be expected to submit?

5th. The juridical value of these resolutions: will the nations represented bind themselves by a foregoing treaty to accept them as binding or will they reserve the ultimate decision to their own several legislatures?

Several other questions will certainly arise in the course of further discussion, but I think the aforementioned may sum up tolerably well the chief difficulties of the problem. If our American friends with whom that bold move originated have a solution ready for them, a solution which takes into account the history of Europe, the constitution and the psychology of European nations, their motion will be found ripe for immediate acceptance and for vigorous activity on behalf of its prompt realization. But if they are not yet so prepared their magnificent scheme will have to ripen in further discussions and preparatory committees, just as the idea of a permanent court for international arbitration ripened for several years in the discussions of the Interparliamentary Union, till it took shape in 1895, when an elaborate project of such a court was accepted by the Union and presented to

the Powers, a project on which The Hague Tribunal is based in the main outlines of its organization.

At all events, you will have the hearty support of the Hungarian Inter-parliamentary Group. The crisis which weighs upon us at the present moment, and which in its essence means simply a conflict between pretensions to arbitrary power and people's right, in no way affects our capacities for embracing higher ideals; it rather inspires us with a stronger enthusiasm on their behalf. Nor are our national energies broken by its trying conflicts; on the contrary, we feel rather invigorated than weakened by the struggle for national independence and constitutional

liberty which is again forced upon us. We had to fight for the preservation of these moral treasures through many eventful centuries; we could never enjoy them in peace and safety, because the spirit of conquest, of oppression and of arbitrary power prevailed in our vicinity. Experience has taught us, then, what a safeguard our neighbor's liberty is to our own and how the highest interests of each nation are dependent on the security of all. Even apart from the mere ideal feelings of universal brotherhood, toward which our souls naturally incline, national egoism is enlightened enough among us to seek for guaranties of its own welfare in the concord and solidarity of mankind.

BUDAPEST, July, 1905.

The Passing of the Household

BY GOLDWIN SMITH.

THE dearth and insubordination of domestic servants, now so generally deplored, are not only an affliction to the mistress but a matter of concern to the sociologist, since they portend the rupture of a familiar and gentle bond between classes, and, if the consequence is to be flight to hotels and apartment houses, a breaking up of home life especially detrimental to the children.

The old English household, it seems, will soon be a thing of the past. The writer remembers one in England a good many years ago in which there were five servants whose united terms of service in that family were about two hundred and thirty years. They were thoroughly attached to that which was their home almost as much as it was the home of the master and mistress, careful of its interests, never letting anything which they could do for it themselves be done elsewhere, jealous for its hospitable name and honor. When the household was broken up by the deaths of its master and mistress they took their pensions and went into no other service. They were simple people, little educated, with vision

pretty much bounded by the limits of the country parish in which the house stood, entirely free from the democratic idea and from the slightest suspicion that there could be anything degrading in domestic service. Their manners, however, were perfectly good. The coachman, after serving fifty years, had a fit on the driving-box. He was offered his full wages as a pension, his house and command of his stable if he would give up the reins. But his answer was that if he ceased to drive the family he would die, and the medical man thought he would. He could not read nor write, but he was an excellent servant, very kind to his beasts, nor was he without sentiment. When his mistress was dying he sent her up a rose as his farewell.

On the other hand, the master and mistress lived at home almost all the year round, looking carefully after their household, and the servants were regarded as members of the family, not mere helps, and were duly remembered in the will.

This phase of life seems to be now passing away, even in rural England. It

is being numbered with the thatched cottage, the mail coach, the country inn, the line of reapers with their sickles and the women following to bind the sheaves, to the sound of the flail in the autumn air. Even rural society in England has been undergoing a great change. Popular education has kindled ambition. Railroads have begotten restlessness and drawn the rural population to the cities. The parish has ceased to be the limit of vision. The gentry are less resident. They wander away more to London or the Continent, and their households are broken up by their absence. Absenteeism is reckoned among the causes of the decline of agricultural England. In not a few cases it is compulsory. Incomes have been reduced by the fall of rents, while the encumbrances remain the same. The old manor house is let to the rich stranger and the old household is no more.

In the United States there can hardly ever have been a perfect counterpart of the old English household. Personal attachments of domestics to the master or mistress there no doubt were. But in the North households must always have been comparatively small, while character was always independent. If there was anything like the English household it was probably in the mansions of the South, when the master was paternal, as we may assume many of the Southern gentlemen to have been. Considering what the negro was and still largely is, while there were many better there were probably some worse things than a model Southern household. The fidelity of the domestic slaves to their trust when the families of their masters were left in their hands after the war seems to speak in favor of the relation. It was the plantation slavery that was the unmixed evil.

The present trouble is not new. More than forty years ago the writer was struck with the scarcity of American domestics and the apparent difficulty of getting anything satisfactory in their room. The master of a house in which he was staying had on Sunday to act as nurse, and in the afternoon the party, returning from a drive, found the two foreign domestics on the floor with a demi-john beside them. The writer was not surprised at hearing soon after that the

master and mistress had gone to live abroad.

One can hardly take up a social journal without reading the wail of the housekeeper, who cries that the parts are inverted, that she is the hired girl and the hired girl is the mistress. Public education, with all its advantages, has given birth to the democratic sentiment which revolts at the thought of calling any one master. In France or Italy a female servant wears the dress of her calling, much as a soldier wears his uniform. At Naples the wet-nurse is proud of her special costume. Here independence is our aim and boast, tho it is not seldom servitude veiled.

The head of a female organization complained to the writer of the low wages of girls and their rude treatment by the bosses in the factories. Some of her grievances were matters for the factory inspector; as to the rest, it was hinted that if the girls continued to crowd into the factories the competition would lower their wages and they might expose themselves to rough treatment, while there were abundant openings for domestic servants in houses where wages were fair and good treatment would be assured. The hint did not take at all. The girls, was the reply, wanted their independence.

The factories seem to be about the worst enemies of the household. Their coming is everywhere courted; yet to a residential city, at all events, it is not clear gain. Besides their smoke they bring a population which bears heavily on the school rate; they are thought not to be always favorable to morality, and they ruin the domestic service. In this instance, as in some others, great material gains may be partly balanced by a moral and social loss.

We had the other day the report of two ladies whom a benevolent curiosity had led to explore factory life in disguise. The life seemed neither refined nor attractive. The labor must be intensely monotonous and dull. The only bright features appear to be dress and flirtation. Nothing can possibly be learned in the factory which could be of the slightest service to a wife or mother. To the consequent discomfort of a home may probably be set down many of the

cases of wife desertion, an offense which appears to be on the increase. The same probably would be found to be sometimes the source of wife beating, which, with the tendency to resort to violence now prevalent, it is proposed to punish by public flogging, in the belief apparently that conjugal harmony would thus be restored. But, then, it must be owned the factory girl has independence after factory hours; limited tho dull and monotonous work; her Sunday to herself. She has companionship, which, where only one servant is kept, is lacking and which no doubt is often a cause of restlessness. She has the sentimental satisfaction of calling nobody master or mistress, tho a master she really has and a stern one. We cannot wonder that the factory, in competition with domestic service, has its attractions, inconvenient as the effect may be.

Of course, so far as the difficulty is individual, the blame rests not always on one side. There may be an inexperience or lack of temper on the part of the mistress. Inexperience, where so many have risen from the ranks, there is likely to be. But these are personal accidents; the sources of trouble are general.

For a remedy recourse is naturally had to importation. In truth, for labor of

the rougher kind in general we look little to the product of our public schools. From immigration no doubt a good deal of relief has been drawn. Swedes especially, we are told, have turned out well. But the democratic idea, if it is not congenial, seems to be easily contracted by infection. An acquaintance of the writer brought from Europe a perfectly trained servant, who remained excellent and contented till by a characteristic accident of American life the democratic idea was injected, upon which he found that domestic service was not the right thing and took his leave.

The choice, then, it seems, is likely to lie between Black and Yellow, neither of them congenial, neither of them capable of being turned into members of a real household. Yellow no doubt is far the smarter and he is wonderfully adept in combining all sorts of service and being at once butler, housemaid and cook. But there is something about him more positively alien to the character of the White than there is in the Black. However, this is a practical question which only mistresses of families who have had experience can decide. Sociology must be content with watching and recording the result.

THE GRANGE, TORONTO.

Affinity

BY JOHN KENDRICK BANGS

ONCE in a garden in the East
A zephyr blew across the close,
And as it swept the floral feast
It lost its heart unto the rose.
But duty held it on its way,
And called it North and South and West—
Returning on a winter's day
It found its love at rest.

The ages passed and still the soft
Enamored breeze held on its path;
Now near to earth and now aloft,
It cut its fate-appointed swath;
But never in its pilgrimage
Forgot that beauteous garden close;
Nor in the later days of age
Its heart-ache for the rose.

So I in that lost other state
Wherein my heart first met the tide
Of Life and Love—ah, blessed fate!—
A rose of beauty once espied;
And though the myriad years have passed
Since first on her my soul was set,
Again I came to her at last—
My own true love as yet.

NEW YORK CITY.

A Visit to the Great Rock Inscription of King Darius

BY A. V. WILLIAMS JACKSON, PH.D.

[Professor Jackson has the chair in Columbia University of Indo-Iranian languages, which means Sanskrit and Avestan, the ancient Persian of Zoroaster. In the study of the Zend-Avesta he is the leading American scholar, and his works on "Zoroaster" and "Avestan Grammar" are translated into German. In the summer of 1903 he visited India, devoting himself especially to the study of the religious customs of the Parsees of Bombay, who maintain the sacred books of the Persian Fire-worshippers, and his later visit to Persia is described below.—EDITOR.]

"Then Darius the King made a decree, and search was made in the house of the rolls, where the treasures were laid up in Babylon; and there was found at Achmetha in the palace [of Ecbatana], that is in the province of the Medes, a roll, and therein was a record thus written."

SUCH are the words of the Bible regarding the edict of the great Persian monarch who favored the rebuilding of the Temple at Jerusalem. But these rolls of perishable parchment, or the letters and epistolary correspondence mentioned in the Apocryphal Books and in the Greek classics, are not the only documents known to have been issued by Darayavaush, "Upholder of Goodness," as his name signifies in Ancient Persian. Our curiosity may be sufficiently aroused to wish to hear how these other writings have been handed down and how it happens that we are able to-day to listen to the *ipsissima verba* of the Great King.

The records referred to are the famous cuneiform inscriptions of Darius the Achæmenian. They are found carved on the ruined palace walls at Persepolis, chiseled upon a crag of Mount Alvand near Hamadan, hewn in the living rock that forms the tomb of Darius at Naksh-i Rostam, inscribed on a granite block found near Suez and

also at Kirman, ensculpt in a specimen of green basalt preserved in the British Museum, engraved on a crystal cylinder seal once used by the monarch himself, and, finally, impressed on tablets of clay discovered at Shushan, the palace. One monument of Darius, however, surpasses all the others in historic importance, boldness of conception and manner of execution; it is the splendid inscription cut on the side of the great Behistun Rock, in Western Persia, near the old Median highway between Hamadan and Kirmanshah.

This magnificent mass of mountain rock, which the natives call Bisitun or Behistun, towers precipitously seventeen hundred feet above the plain. A deep gully cuts a gash in one side of its sheer front, and on the face of this rocky *couloir*, at a height of more than three hundred feet above the crystal spring which bubbles from the mountain's base, Darius caused a large surface of the stone to be smoothed off to receive his royal edict. He then had his own image, of heroic size, sculptured in bas relief. Before him stand nine captive kings fettered and chained, upon whom, with raised hand, he pronounces sentence of death. Beneath his feet lies the prostrate form of a tenth, begging in vain for mercy. Behind the king are

stationed two of his trusty generals and counselors, and in a winged circle above his head floats the supreme god Ormazd, blessing and sanctioning the monarch's acts. Below and beside the sculptured group there are carved in three languages line after line of wedge-shaped characters, arranged in columns so as to tell the story of the scene and rehearse the achievements of the great king. In his own words Darius recounts how he became king by divine right and through his personal prowess. He tells of the battles he had fought and the victories he had won, the rebellions he had

who have discovered the cuneiform key, deciphered and translated the inscriptions, and opened to us the treasures of the past. Foremost among these pioneers was Grotefend, who in 1802 first solved the enigma of the nail-headed characters carved on the walls at Persepolis, tho his successors come in for almost an equal share of honor through their interpretation of the texts themselves. One name, however, must be mentioned above all the others, whether German, French or Danish; it is the name of the Englishman, Henry Creswicke Rawlinson, who gave to the world

View of Behistun Rock from the upper end. From a sketch after a photograph by Prof. A. V. Williams Jackson.

crushed and the triumphs he had achieved in organizing and administering his far-reaching empire.

But how do we know all this? Whence comes this Daniel-skill in reading the mysterious handwriting on the wall? Why are we sure that the king and the "nine dervishes" do not represent Shalmaneser and the captive tribes of Israel, as was once suggested, or even the twelve Apostles, as a European traveler fancied over a hundred years ago? How can we be certain, also, that Semiramis did not carve the sculptures, as might be inferred from Diodorus Siculus? The ability to give a positive answer to these questions is due to the knowledge gained through the learning, skill, ingenuity and patient labor of scholars

the contents of the great monument of Behistun.

This mountain high and its sculptures had been known since the days of antiquity, but owing to the danger and difficulty of scaling the scarped rock to reach them no one attempted to solve the riddle of its inscriptions. Kinneir, in 1810, saw the bas-reliefs and tablets, but did not essay the task of trying to copy them. Ker Porter, eight years later, climbed half way up to sketch the sculptures, but did not reach the ledge to copy the texts. He speaks of the perils of the ascent, and adds that "at no time can it be attempted without great personal risk." Flandin and Coste abandoned without success the enterprise of climbing the rock, tho espe-

cially commissioned by the French Government to do archeological work in Persia. It remained for Rawlinson to make the hazardous ascent.

At the time he was a young military officer, between the age of twenty-five and twenty-seven, employed in training native recruits for the army of the Shah. While stationed at Hamadan he had already by himself learned to read the cuneiform characters, having copied and practically independently deciphered the short inscriptions of Darius and Xerxes at the Ganj Namah on Mount Alvand. Outside of the knowledge thus gained his only aid, for a considerable time at least, seems to have been the information that Grotefend had discovered the cuneiform key and that other scholars were beginning to interpret the Persepolis inscriptions which contained records of the Achæmenian kings. An appointment in 1835 from the Persian monarch took him to Kirmanshah, about twenty miles from Bisitûn, and gave him an excellent opportunity to attempt the climb to the ledge where the inscriptions are cut. This enterprise he successfully accomplished, and he made the ascent of the rock a number of times during his two years' stay at Kirmanshah. In this way he was able to transcribe a large part of the Persian column and to translate and prepare it for publication. His work, however, was interrupted for a considerable period by other duties and by active service for three years in the Afghan War. But he never forgot the great task which he had set before himself to finish. Giving up therefore a more lucrative and promising opening in India after the war, he returned to Persia in 1843, and the next year found him once more at Bisitûn. Risking life and limb again, he was able by frequent ascents of the cliff to finish the transcription of the Persian text and add a copy of the so-called Scythian, Median, Neo-Susian or Elamitic version of the great edict, supplementing this three years later, in 1847, by a revision of the whole text and a reproduction of the Babylonian column, which he secured through the help of a wild Kurdish shepherd lad, who performed the perilous feat of taking a paper squeeze of that almost inaccessible inscription.

This is not the place to enter into details or discuss the importance of the great decipherer's work or the later contributions based upon it by others. They are too well known to philologists to need repetition here; but as no one but Rawlinson had studied the rock itself the scholarly accuracy of his copy, made nearly seventy years ago, could not be tested in a number of points. It was one of the incidental purposes of my own journey to Persia two years ago to make the ascent of Behistun, if possible, and to examine some of the mooted passages in the Persian cuneiform text given by him.

I shall never forget that beautiful Easter Monday morning, April 13th, 1903, when Bisitûn in all its lofty majesty loomed up before me. With all I had read about it, with all I had heard about it, with all I had thought about it beforehand I had not the faintest conception of the Gibraltar-like impressiveness of this rugged crag until I came into its Titan presence and felt the grandeur of its somber shadow and towering frame. It seemed like some giant iceberg rising from the plain of the sea. Snow and clouds capped its peaks and birds innumerable were soaring aloft about it or hovering near the place where the inscriptions are hewn in the rock.

There, as I looked upward more than three hundred feet above the ground, I could see the bas-relief of the great King Darius. Prone at his feet lay Gaumata, the Magian usurper, who had seized the throne on the death of Cambyses. The line of captive kings was visible, and I could discern faint traces of the tablets above their heads inscribed with the "lie" each had uttered in his false claim to the crown, tho the letters at such a distance were quite illegible, as the characters are only about one and one-quarter inches high. The story of the fate of these rebel lords came back to my memory from the inscription. I could picture the awful torture and agonized death meted out to each by the king. Of the Median pretender, Fravartish, he says, for example:

"The rebel was captured and brought to me. I cut off his nose and his ears, and cut out his tongue, and I dug out his eyes. He was kept bound at my gate; all the people saw

him. Then I caused him to be impaled at Ec-batana [Hamadan]."

Such were the cruel punishments deemed proper to inflict upon national offenders in Darius's time. The five columns of ancient Persian writing and the tablets in translation continue the account of the reign of Darius, and they are of the greatest value in confirming Herodotus. All that Darius does is "done by the grace of Auramazda," the god in whom he places implicit trust. The great king lives again, speaking to his people and to us.

The surface covered by the inscriptions and sculptures is several hundred square feet in extent. The space occupied by the group of figures is over twenty feet in length and more than ten in height. The tables in the three languages, below and beside it, are fully as much again and more. The five Persian columns directly below the bas-relief are spread over a space of about twenty-five feet by twelve. The Elamitic version is around the ledge on the lower left-hand side and very difficult of approach; the Babylonian rendering is on the face of the rock jutting out above this. The supplementary inscriptions and sculptures are carved around and to the right of where the sculptures are. It would be possible with a good telescope to make out some of the inscriptions from below, if the light were favorable, but wholly impossible to read it all, as the projecting ledge of precipitous rock shuts much of it off from view. An ascent of the crag alone will suffice; this I determined to attempt, and an account of my experience and details of what I was able to accomplish in the way of revision are to be found in *The Journal* of the American Oriental Society, October, 1903.

In the first place, I found it possible to get somewhat closer to the inscriptions which are on the side of a ravine by climbing up the shaft-like gorge past huge boulders and fragments of fallen crags, which make the approach not easy. The peculiar formation of the rocky *couloir* then brought me face to face with the problem of reaching the ledge. Having heard from a Persian friend that it would probably be best to be let down from above, I had previously studied up some of the methods em-

ployed by the bird-nesters in the Hebrides in being lowered by ropes over craggy cliffs. A brief examination of the situation, however, showed that the only feasible approach was by climbing and being drawn up by cords. In less than an hour the preparations for the task were begun.

Meshed Ali, the owner of the caravan-sari nearest to the rock, found five men who were ready to undertake the ascent. A sixth, Kuli, the guide and best of them all, was added later; and the procession, with ropes and a ladder, was soon under way toward the beetling precipice. Whatever may be said against the ladders, which proved of little use, nothing can be maintained against the Persian goat-hair ropes, for their quality is excellent. The cords that bound the luggage on the caravan pack-horse, supplemented by ropes furnished by the Bisitûn guides, and firmly fastened about the chest with knots that only a Persian knows how to tie, were a pledge of surety against slipping and gave confidence for the climb. The stout protest of the guides against my riding boots were well founded, as the risks of the first day proved; but a happy substitute for these was found later in the native *givaqs*, resembling rough tennis shoes, which were loaned by one of the Persian bystanders and firmly sewn upon the feet with a heavy pack-thread needle. All then was ready. The exciting task began. The ascent of the first huge fissure in the side of the *couloir*, the clamber with torn hands and clothes along the brink of a precipitous crag, the tugging ropes that helped up the steep incline of the second rock, the scramble past the thorn bush that barred the way farther up, and the final tug and spring that brought to the edge of the ledge, together with "*Xaili rub*," "Very good," and the encouraging word of the guides, "No fear now, the danger is over," will not readily be forgotten. I could not help feeling a thrill for a moment and giving a wave to a tiny silk American flag which I had in my pocket. Only when one has stood on the narrow ledge by the side of the inscriptions and looked out over the magnificent plain far beneath, and listened to the dull murmur of the stream below as it bursts from the mountain's base, does

one know how to appreciate Rawlinson's work. It may interest others, as it did me, to know that he has carved his name in the stone a few inches below the very inscriptions which he first made known to the modern world. This he was entitled to do, and one is almost inclined to append after his simple "H. C. Rawlinson, 1844," the words of ancient India's homage—*Namo namah*.

It took a while to get used to the giddy hight and I devoted my attention first to examining the general condition of the rock; noting the sculptures, measuring and observing certain details in the tablets. It was almost too fascinating work to leave when time came on the first day to descend, but the experience cost me a sleepless night as a consequence. No sooner did dawn break than I felt myself irresistibly drawn again toward the rock and I was able to accomplish more on this second ascent. I also took some photographs, the first I believe that were ever taken on the ledge; they were "snapped" as I leaned over the precipice, held by the guides while focusing the camera and hastily taking the picture. Most of my time, however, I spent in verifying the text and copying special readings. This second experience and the two following days made it clear to me how much the inscription has suffered since Rawlinson's day owing to the water which trickles from above one part of its face. In places the stone has been washed away in great bands, but where the water has not come the letters are as clear and beautiful as when the royal sculptor laid his chisel and mallet aside. I may note that in the damaged portions I was able to restore a number of words by a careful examination of the dots, or indentures, which the heavy stroke of the engraver's chisel had made in carving the character.

In the course of my four ascents it was possible to verify more of the mooted passages, except in the upper part, and in general to prove the great accuracy of Rawlinson's transcript. I found likewise some entirely new readings, which I have regarded in my report to the American Oriental Society. I only regretted that I had not time and money to finish the whole work. Money is essential, as the natives required to be well paid for making the ascents. Time is indispensable for many reasons. The conditions are not always favorable; the wind, for example, is a serious matter, owing to the hight and the peculiar formation of the rock. On the last day, for instance, after I had finished all I could reach or clearly see, I begged the guides to let me use the ladder in order to examine some of the less certain readings in the upper part of the inscription. This they stoutly refused to do on account of the extreme danger from the high wind blowing at the time; and that afternoon I was obliged to start back for Hamadan. Time to rest is necessary, for the ascent is a physical strain and requires some athletic prowess, and there is considerable nervous strain owing to the exciting interest in the work and the necessarily intense concentration which taxes the nerves.

Regarding the descent, I may add that when I had been for hours on the cramped and narrow ledge the going down seemed much more difficult than the ascent, and it was a joy each time to hear my faithful Persian servant, Safar, who remained below, call out: "Now you are safe," when I passed the last dangerous place and reached the ground. The unloosening of the tight-bound ropes followed quickly with his aid. All had gone well.

Diplomacy and the War

BY COUNT OKUMA

TRANSLATED AND EDITED BY ADACHI KINNOSUKE

[Count Okuma is regarded by many Japanese as their greatest diplomatist. He has several times held office in the Cabinet. At the time when Japan lost Sakhalin he was Minister of Finance and approved the purchase from Russia of her claim to the northern half of the island.—EDITOR.]

MEN are asking: "And what of the path in front of the war?"

There is one answer to that: it stretches afar. I do not hesitate to say that the final victory is certainly with us. If for no other reason, for this: that the cause of the march of things can never be stopped by a man's putting up his hand or even if so great a country as Russia does not like it. In her form of government, in religion and in many and diverse institutions that are fostered within her boundary Russia seems to have dropped behind the march, and for many days she has behaved with seeming impunity as an outlaw in the eyes of the law of evolution, whose pleasure it is that the fittest shall survive. And in this present war she has marched straight

into that sad realm where every battle spells defeat, and this, spite of her large country, spite of her boasted military prowess. It is not surprising; that often is the manner in which the passionless March of Things comments on a human power whose boast is despotism and the chief concern of which seems to be that the intellectual night over her people might continue. The fall of Port Arthur, that proud Pacific squadron of Russia that was, and the defeat of Mukden, they are the blows from which a Power can hardly rise. Nevertheless, Russia is a great country, and the vanity of a great Power is hers; having looked upon herself as the greatest military Power in the world for so long a time she has a great deal of trouble in con-

quering a certain mental inertia in reversing her viewpoint and looking upon herself and upon things and men and on the world at large from a new angle and in a new and correct light. Not easily would it be possible for her to persuade herself to bend her knees to Nippon. And when it comes to that, while there are many foolish men in Nippon, there are none so mad as to dream for a moment of our army pushing across the Ural and overrunning the European Russia, capturing St. Petersburg and so compelling the White Czar to ride upon a white horse and march out of his citadel in all the humility of a vanquished monarch to whom the victorious Power can dictate the terms of peace. For the sake of those who are fond of words let us suppose our financial power and military ability equal for the task; even then, what does it profit us in doing such a thing? In a word, this work of persuading Russia to part with her gold, glory and some of her territory all for the glory of Nippon arms is not quite as easy a task as is supposed in a certain corner of our country. There are a number of good people who would tell you that the internal troubles of Russia are getting to such an acute stage that she would have no other choice but to see the wisdom of praying at the feet of her enemy for the terms of peace which she, willy nilly, would have to accept. That is a beautiful way of looking at things, but to carry on the war with the hope that the internal development of the enemy's country would co-operate with us and compel its final defeat is, if one were to stop a moment to think of it, a rather foolish dream.

Nowadays he who fights understands the importance of fortifying well the position he succeeds in taking from the enemy before he would think of advancing to the second position. If a general, like the traditional wild boar of Kajiwara, only knows how to push forward, riding upon the wings of his temporary victory, and does not know the time and place to stop and make good the ground gained, he will find himself on a fine morning—and it is simply the question of time when he shall face such a fate—making a bitter acquaintance of defeat. And under such

circumstances one reverse is quite enough to prevent him from gathering the fruits of his former victory. And sometimes it does not stop there; he might even lose what he had had before he went into battle. To-day you look upon those huge defensive works constructed by our army along the path of its march in Manchuria with the eyes which have witnessed the one continuous and unbroken stretch of victories and you are tempted to say of them what a foolish expenditure of forces and money. If, however, you were in the position of men who are to map and carry on a war upon which depends the very life of their country, you would not think that.

As with the military tactics, so also with internal administration, and more especially is it true with diplomacy.

This is a trying day for Nippon. So many of her people have been accustomed in the past to the unbroken record of victory that we have ceased to make any distinction between a battle and victory; when we fight it is impossible for us to expect anything else but the news of victory. And we are about to face this critical hour of our national life with a rather careless ease. It is a sad state of things. "After a victory, if the general be proud and the soldier be indolent defeat homes in their camp," is a famous saying of ages. Often I have been censured for taking a pessimistic view of things. The very fact that I am blamed for taking a darker view seems to point to a necessity of a certain warning in this our victorious hour. I think very little of one who, drunk with success, takes the rosy view of all things and events. Nothing, in my judgment, affords a country so much of inward strength and confidence as to examine, from time to time, while she is engaged in a struggle of the gravest import, as we are to-day, the national determination to face whatever the fate and the future have in store for her—to examine with what spirit she is prepared to face the situation if all things were to take an opposite turn and instead of an endless march of victories, she be called upon to face the unbroken stretch of reverses. There is something decidedly unhealthy in a country which refuses to look upon the black side of the eventualities in the very height of her

prosperity and in the hour of her victory.

To be sure, hope is a wing of national aspiration, and a touch of optimism in the outlook is the most kindly fire that would keep our enthusiasm aglow. It might be said also that a show of national confidence in her ability of mastering the future and the events to be is essential to beat the enemy without battles and blood.

So far, however, as the exhibition of our national spirit is concerned there is no need of putting up anything like a diplomatic bluff. The fifth internal loans were taken up with an enthusiasm and cheerfulness not a whit less than the first—oversubscribed many times. And this simple fact, which is one of the many straws, eloquent with the tendency of things, might have a decided influence upon the Western mind, to which "money talks" so much. It might be added in passing that in all my readings of history I have yet to find a peer to the national enthusiasm of Nippon for the prosecution of the present war to the definite and decisive and successful end.

On the other hand, a country always pays, and rather dearly and bitterly too, for her overconfidence. Take, for example, the case of the fall of Port Arthur in this very war. It was noised abroad that we should take the stronghold by June, and when the month of June came and went the nation was assured that beyond doubt we should be within the fortress by August. When August came and went there was a tendency of reaction—a touch of disappointment among the people.

I do believe that both our army and navy are worthy of all our confidence; in my judgment, we have enough and to spare of the financial resources with which to prosecute the war to its successful issue; there is no misgiving, as I have said, as to the final issue of the struggle. At the present time what commands our deepest interest is how to bring out the speediest possible conclusion to the unhappy war without sacrificing the aim and end for which we have taken up arms, and thereby how to minimize the valuable sacrifices which are being made from day to day, and also how to turn the energy and enterprises of the nation

from the destructive channel into a productive field.

Diplomacy, strong and wise—to it the nation must look for solution. Also, along the battle front, a passive and waiting tactics. These are two principal means to bring about the desired result.

That the Baltic fleet had gone by Annam and passed into the China Sea is due to the sad inactivity of our diplomacy. If only our diplomatic activity had taken a strong attitude, strong enough to move our ally, England, it would have been out of question for France to interpret her neutrality in such a benevolent light as she has done. For if we were to take strong measures against the violation of neutrality by France we certainly would have threatened a world war. A great European war is something that England dreads more than anything else. It is not hard to see what would have been the fate of the Baltic squadron under just such strong diplomatic measures. To fight a hundred battles and gain a hundred victories are, nevertheless, not the best of good things. To defeat the enemy without fighting—that is the good of all good things.

Of late England and France have entered into a rather intimate understanding; the fall of Russia evidently is the cause of it. And the fall of Russia is due to the rise of Nippon. And the friendly relations between England and France is to affect materially the diplomatic policy of Germany. It can be seen, therefore, that the rise of our power has brought with it a radical change in the balance of power in Europe. At present, at any rate, Nippon seems to be the center of the world's diplomatic activities. And at this spacious hour one can hardly help but pray and hope for the activity of our Foreign Office, more alive and more energetic than of wont.

As for the military policy with which to face Russia, it is to carry on a passive war. There is no need for us to push our fighting line far into the hostile distances. We shall occupy and command the Russian coast lines in the Far East. Into the territory cleared by our army we shall send our farmers and our merchants. They are they who shall pull

out the Russian power in the East by the root. We shall continue to hold the command of the sea. And, after all that, we shall stretch out a strong line of defensive work along the frontier, and so, if they like, we can continue fighting the Russians as long as they please, without spending but a very little in expenditure and men. This, indeed, would be also a happy way of pushing the constructive work—the work that would make for the upbuilding of civilization in the con-

quered territories of Russia, even while the armies of two Powers stand face to face. It would profit Russia nothing to send a huge fleet to the Far East; where is she to put them, even if they manage to get to their destination?

If we people of Nippon were to pin our program along these lines and place our determination to carry out the same, there would not be a hair of misgiving hanging athwart the future path of the war.

TOKYO, JAPAN.

Augustine's Dream

BY HARRIET PRESCOTT SPOFFORD

THE eager saint, by day, by night,
Had followed devious ways that be
Among the secret things, for light
On the Eucharistic Mystery.
The treasure of monastic cells,
Old scrolls, old parchments, had he thumbed,
Old palimpsests had searched, and wells
Of philosophic fancy plumbed.
With holy hermits, darkly taught
By solitude, and set apart
In desert places, had he wrought—
And in the depths of his own heart.
But tho with such a dear desire
No man before the air had trod,
In vain he sought from gyre to gyre
The essence of the Lord Our God.

Sleeping, one night at last, he played
A boy again, along the shore,
And in the sand a hollow made,
And, happy in his dream, he bore
Drops from the falling wave to fill
The little basin with his shell,
And, going softly, not to spill
The clear sea-water for his well,
Looked up and saw a rosy child
Beside him paused. "I dip," said he,
While the guest gazed and gently smiled,
"Into this hollow all the sea."

Listening, the child, with lifted hand,
Turned, and they saw the foam-bows fleet,
And saw the tide creep up the land
And patter 'round their little feet.
Blue as some shining sapphire shield
On an almighty arm might hang
The vast deep lay, and all its field
With music of great movement rang.
Far, far, from sky to sky it swelled—
The wide and ever wandering sea—
Nor in the long horizon held,
But darkening to immensity.

Then slow, before his wondering eyes,
The child forsook that dimpled curve
Of rose and snow, and toward the skies
With many a sweeping upward swerve
Of pointed wings his stature grew,
Long-limbed as those that bear the rood.
And awfully against the blue
A great and grave archangel stood.
"Not thine," he said, "to pierce the power
That wraps, as space the farthest clod,
That wraps, as sunshine wraps the flower,
The essence of the Lord Our God.
Nay, Augustine," he cried, "less bold,
In that small hollow pour the sea!
But seek not in thy thought to hold
The measure of Infinity!"

NEWBURYPORT, MASS.

Evan Roberts and the Welsh Revival

BY GEORGE T. B. DAVIS

[Mr. Davis has just returned to this country from a journey through the Welsh revival district, and gives the following sympathetic account of this remarkable movement and its leader, from whom he was fortunate enough to obtain an interview. Mr. Davis while in England also studied the Torrey-Alexander evangelistic campaign, which has been so successful in London. This article is copyrighted in England.—EDITOR.]

S EVEN months after the great Welsh revival had broken out and had swept over the Principality like a cyclone, leaving in its wake over 100,000 converts and scores of transformed towns and villages, it was my privilege to pay a second visit to the redeemed land and to see at first hand some of the changes wrought by the great awakening.

I went first to Cardiff, where I heard that a large number of the churches were conducting open-air street meetings two or three times a week, these services for the most part being under the management of converts of the revival. I was told that the midweek prayer meetings were crowded and that every department of church life was going forward with an enthusiasm and virility unknown before the revival.

From Cardiff I went to Pontypridd and had the privilege of attending a prayer meeting held in a coal mine, a thousand feet below the earth's surface. The manager of the colliery in arranging for my visit told me that the prayer meetings had been held daily for six months and that they had been started by a revival convert. The man had formerly been a scoffer, and after his conversion one of his old comrades taunted him by saying that he was afraid to start a prayer meeting in the coal mine. The very next morning the convert started the prayer meeting and it has gone on without a break ever since. It is attended each morning by from 250 to 300 men.

The manager told me that since the revival the men did better work and that some of the worst characters in the mine had been completely transformed.

Never will I forget that visit to the colliery prayer meeting held at 6.30 a.m. My collier guide was Mr. D. Daniel, who is known as "the collier revivalist" and who held a mission in London during which there were over 100 converts. After descending rapidly through the utter darkness to the bottom of the shaft we walked through the dimly lighted tunnels some distance to a sort of double tunnel, where already scores of miners were sitting in the semi-darkness, each one with his lantern placed before him. The meeting was opened with the reading of a few verses of Scripture by a collier, followed by two or three prayers and several hymns. Brief words of exhortation were then given and the meeting ended with another prayer and a closing hymn. It was an inspiration to hear those Welsh colliers with their full, rich basso voices sing amid the surrounding darkness:

"Lead, Kindly Light, amid th' encircling gloom,

Lead Thou me on.

The night is dark and I am far from home,

Lead Thou me on.

The weird scene presented by those consecrated miners sitting in the semi-darkness praising God and imploring His protection during the day will never be erased from my memory. It gave me a new and vivid sense of the glorious reality of the Gospel in every circum-

stance of life. It carried me back in imagination to the days of the early Church, when the Christians of Rome met in the catacombs in dim, underground corridors like those in which we were then assembled.

My guide up the shaft after the prayer meeting was a man who is the superintendent of a Sunday-school of nearly 400 members. He declared that the revival had transformed his Sunday-school, for whereas formerly the teachers as well as the scholars had been lukewarm, they are now filled with apostolic fervor. The face of my collier guide was frequently aglow as he talked with me.

Later I visited Loughor, where the revival flame first burned brightly under

the leadership of Evan Roberts. In the course of an interesting conversation with Mr. Roberts's mother and sister I learned that for years before the revival began he had been accustomed to attend Gospel services in the village chapels almost every night in the week. He was a leader in the work among young people and was for years superintendent of the Sunday-school at Pisgah Chapel, a branch of Moriah Chapel, where his first revival meetings were held. I had an interesting conversation with Mr. F. O. Harries, who was Mr. Roberts's schoolmaster during his boyhood. Mr. Harries told me that whereas it was the usual custom in other schools to have ten or fifteen minutes of Bible instruction at the

Evan Roberts. This photograph was taken by Mr. Davis and is considered the best picture extant of the famous revivalist.

The Home of the Miner Evangelist in Loughor, Wales

opening of the school each morning, he had always given over thirty minutes daily to teaching the Scriptures to his scholars.

From South Wales I journeyed through the beautiful hills and valleys of the Principality to North Wales, in quest of the leader of the great awakening, Mr. Evan Roberts. From friends I learned that he was resting at Wylva, a country residence near the village of Cemaes, in Anglesey. On alighting from the train I was engaged in making inquiries as to how I could get a conveyance that would carry me the five miles to Wylva, when in the good providence of God who

should drive up to the station but the revivalist himself.

After mutual greetings—I had formerly become acquainted with Mr. Roberts during the heart of the revival at Swansea—and an explanation of my mission, Mr. Roberts consented to give me an authentic narrative of how he began the revival meetings which so quickly astonished the entire world. Mr. Roberts invited me up into the carriage and during our five miles' ride gave me a graphic narrative of the great awakening. The sun shone brightly down upon us and the revivalist was in buoyant spirits as with glowing eyes he told of what God

had wrought. He had already been resting for some weeks and his daily exercise in walking, rowing and fishing amid the Welsh hills had once more put him in fine physical condition.

In response to my inquiries regarding the circumstances under which his meetings were commenced he said:

"For five months before the revival began I had prayed agonizingly for the

work. I wanted to do it and was determined to do it, but could not. This power was too strong to resist. At last I went home one Sunday to see my minister and told him I had come for a week to work among the young men of the town. He consented to my holding a week's meetings and said he *hoped* I would succeed. I said I *knew* I would have success. The special meetings be-

Evans Roberts and the Singing Girls with whom he began his revival work. He is now assisted only by Miss Anna Davies and his sister, Miss Mary Roberts.

Holy Spirit. Each day I spent from three to eight hours in prayer. Before that I had been a sound sleeper, but beginning in May, 1904, I awoke at one o'clock each night and prayed sometimes until 4 a.m. and sometimes until 9 a.m. This was while I was attending school at Newcastle Emlyn. Finally, six weeks before the revival began I received the baptism of the Holy Spirit. After this had occurred I could not do my school

gan that same Monday night at 8 o'clock at the close of the church prayer meeting. At my first meeting there were sixteen present beside myself. Several of these were members of my own family. Before the meeting ended every one of those sixteen persons stood up and publicly confessed Christ. They had all been Christians before, but most of them had never confessed their faith. Some of them would almost rather have died

than have spoken in meetings about their love for Christ. It took just about two hours for the sixteen to confess, and the first meeting closed at 10 p.m. At the second meeting on Tuesday night six more confessed. The power was very strong. There was weeping all over the room. On Wednesday night five men and women from ——— chapel were present also and confessed. On Thursday evening we had a remarkable proof that God answers prayer. After ten had

the Baptist and the Independent Congregational churches.

"On Saturday evening a temperance meeting was held in the church from 7 till 8 p.m. I arrived when the first meeting was almost closed and spoke on the text, 'Be not drunk with wine wherein is excess, but be filled with the Spirit.' I told how drink injures the church, the family, the personal character, the reputation and the soul. That meeting was so fervid that it did not end until 12.30

Moriah Chapel, Loughor, Where the Revival Flame Began

confessed I was not satisfied and asked the Lord for another ten. The prayer was answered, for ten and ten only confessed, and the meeting ended at 11 p.m.

During these first four nights the meetings consisted chiefly of those who had already confessed Christ; they told how happy they were now. Never before in their lives they declared had they experienced such happiness.

"On both Thursday and Friday evenings people began to come in from the other churches in the village. On both evenings people were present from both

a.m. On Sunday night (the last meeting of the first week) the service began at 6 p.m., and at 9 p.m. we had a baptism of the Holy Ghost and of fire.

"Thereafter every night of the second week, except Tuesday night, scores had a baptism of the Holy Spirit. The meetings lasted until 2.30 to 5 a.m. The people wouldn't leave the place. Scores of strong, able-bodied men could be seen all over the building weeping and crying like babies. Every night some climax was reached. We never knew what the climax would be until we saw it.

A Revival Journey on a Revival Train. The Engineer, Fireman and Guard Are Ardent Revivalists

"The news of the meetings spread and on Saturday a letter was received from Aberdare asking the minister and me to occupy the pulpit on Sunday. The invitation was accepted, and before going to the meeting on Saturday evening I told my mother I would be home early, so as to rest before the Sunday meeting. But the Saturday night meeting was so hot that it lasted eleven hours and I reached home at 5.30 Sunday morning.

"There was no time then for rest. We had to drive at once thirty or forty miles to Aberdare for the Sunday morning service. I went for the day, expecting to return on Monday, but I didn't get home until Christmas—six weeks later! In

three days the town of Aberdare was ablaze with the Holy Spirit."

Mr. Roberts gave me this most remarkable narrative as we drove along in the carriage, up hill and down dale, on the way to Wylva. The sun shone down brilliantly. All along the road cottagers and farm laborers stood up and saluted the revivalist, their faces aglow with love and admiration, and he frequently doffed his hat in return while in the midst of a sentence. No matter how busily he was talking he never failed to see every one we passed and to salute them cordially. At one point the carriage stopped for a moment while Mr. Roberts shook hands with a grizzled Welsh farmer.

After concluding the story of how the revival began, Mr. Roberts went on to say:

"The power of the revival is prayer. Not long prayer, but short, and prayers filled with faith. If one or one hundred are moved to pray at the same time they do so because they do not pray to man but to God."

When I asked Mr. Roberts what he considered had been the chief characteristic of the meetings he said: "That is very hard to tell. There was such a variety in the meetings. No two were alike. There is an infinite variety in the working of the Holy Spirit."

In answer to my question as to how much longer he thought the revival would last in Wales, Mr. Roberts said that could not be foretold, but he believed that we had only seen a portion of it as yet.

"Do you believe the revival will spread over the whole world and reach even to heathen lands?" I asked.

"Yes, yes," he replied.

When I asked Mr. Roberts to give one or two suggestions as to how revivals might be brought about in every church and how every Christian might experience the revival flame, he said:

"The way to have a revival is by prayer and by *unity* in prayer. Each church should have a prayer circle and each Christian should be ready to surrender all to the Master. The Bible must be read daily. Let every church member read it daily, no matter how small a portion. The Spirit will show how much to read."

I then turned the conversation to the personal side of the revivalist and asked him what was his favorite Bible verse. In answer he said:

"It varies. As you go on in life one passage will be most forcible to-day, another to-morrow. My great passage until recently was, 'Lo, I am with you always;' but now since Wales has had the revival it is, 'And I, if I be lifted up, will draw all men unto Me.' We have had the revival here and now we want the flame to go out and spread over the world."

Gospel song having been such a prominent feature of the revival—some have

even termed it "a revival of song"—I was anxious to know what hymn had become the revivalist's favorite. In reply to my query he said:

"Of the Welsh hymns my favorite is 'Duw - mawr - y - Rhyfeddod-an-maith,' which is in English 'Great God of Wonders.' It is usually sung to the tune Huddersfield or Sovereignty. Of the English songs my favorite is 'Never Lose Sight of Jesus.'" Mr. Roberts had on a previous occasion told me that the latter was sung over two hundred times at a single revival meeting. Mr. Roberts declared that, of course, "Diolch Iddo!" the chant of victory which generally arises when a new convert is announced, was one of the prime favorites everywhere. "Diolch Iddo" means in English "Thanks be to Him."

I finally asked Mr. Roberts if he could give me one or two incidents of the revival which had most impressed him. After a few moments' thought he said:

"I will tell you two stirring incidents, for they will strengthen faith. The first occurred in the month of November at a place called Pyle in South Wales. While the meeting was going on I became very thirsty and walked down through the aisle and out of the building to get a drink of water. While outside I noticed a cab standing beside the church. I returned to the meeting, but could not be easy there; a voice told me to go out and speak to the cabman about his soul. So I went out, but when I got outside the cab had gone. Just then three young men came along. I spoke to them and one of them yielded. I was about to return when another group of three or four young men came by, and in response to my appeal two of them yielded to Christ. Then, most strangely, the cab returned and I spoke to the cabman and he also was converted."

"But the strangest part of the story has yet to come. I then entered the building for the third time during the meeting. We had twelve conversions inside the building and three outside—fifteen in all. There was one young man in the gallery who would not yield that night. Mr. Phillips, a minister, spoke to him, but he would not yield. On the opposite side of the gallery was another man, Mr.

Jones, with a notebook in his hand taking the names of converts. I said to Mr. Jones, 'Put this young man's name down,' and his name was put down. Then I prayed. When I had finished I asked Mr. Phillips if the young man would yield, and he instantly was on his feet giving himself to God. God answers prayer.

"The other incident which I remember vividly was about a young man seated in the gallery of a church during a meeting who wouldn't yield. They spoke to him about his soul, and I also pleaded with him, but he was very sarcastic and was determined not to yield. I took his hand and said, 'Before you go to rest to-night will you say these words, "Here I go to rest, but a condemned and lost man"?' I came down from the gallery at 11.55 p.m. and told the congregation that the young man would find salvation before the dawn. What was the result? The dawn came before 12 o'clock and the young man came down to thank me."

Just as Mr. Roberts finished giving me this incident our five miles' drive to Wylva concluded. Never will I forget that delightful ride with the famous re-

vivalist. In spite of his world-wide fame he is meek and lowly in spirit. He has a peculiarly affectionate disposition and one cannot be long in his company without loving him sincerely. Doubtless his life-work has only begun and a mighty field of usefulness lies before him in the future.

In some districts of Wales the part taken by the children in the revival was so prominent that it might almost have been called "a children's revival." It is especially remarkable that extremely young children prayed in public of their own accord. For example, there were two boys of seven years of age who often prayed publicly in meetings at the chapel in Loughor, where the revival broke out first. I have been told that in every case where children prayed publicly for other children and for grown people there was not a single failure of conversion within two weeks after the children had offered their petition.

I heard a beautiful incident of a child who went home at the close of a meeting and said to his father: "Father, why don't you pray?" "Oh," said the father; "let's not talk about that to-night. Just

Baptism by Immersion in Cromcerddin Brook, Glyncorrwg, Glam

run off to bed; we'll talk about that tomorrow." "But why don't you pray, father?" he asked again. "Run off to bed now; I can't talk about that tonight," said the father. Finally the boy said, "Well, daddy, I can't call you 'daddy' any more unless you pray." And the father was converted.

I heard also a striking incident of the spiritual insight of a child whose father was a drunkard. One night the drunkard had a dream which troubled him very much and the next morning he told it to his wife and little boy. He said: "I dreamed that there were rats crawling over my bed; I couldn't get them away. Three of them I particularly noticed; one of them was a great fat rat, the second was a very lean rat and the other rat was blind. I can't think what it meant." The little boy said, "Papa, I know what it meant." "What did it mean?" asked the father. "Well," the boy replied, "the big fat rat is the saloon keeper, the lean rat is mother and me and the blind rat is you."

A little five-year-old child was in one of the crowded meetings of the Welsh revival. There was a fearful crush in the house and how he got there without being crushed to death nobody knew. He got up and sang during the meeting "Jesus wants me for a sunbeam." They asked him why he was a Christian. "Why," he said, "because I gave my heart to Jesus two days ago and I want everybody to know about it."

The prayers of some of the collier converts are most touching and beautiful in their directness. One man prayed: "Lord, you know that I was the worst drunkard in ——." Then he stopped, thought a little and went on: "No, Lord, I wasn't the worst; there is one fellow who is worse than I was. Now if you will save him you will have the pair of us."

One man praying down in a mine said. "Lord, you know that the clothes I have on are the first decent ones I have ever had." Other men will get up and thank God for a happy Christmas and homes that have furniture in them and all things of that kind, showing clearly that their religion has transformed their daily lives.

A Member of Parliament attended a revival meeting, where he heard a

woman utter a prayer so beautiful that it deeply impressed him. Later, to his great astonishment, he learned that the woman was one of his own servants.

On the street of a Welsh village I went up to a policeman and asked him whether the revival was strong in his town. He declared that it was exceedingly strong—so strong, in fact, that every one in the village save himself was a member of the Church. Tho he had not himself confessed Christ, yet he declared that the revival had diminished drunkenness so greatly and uplifted the moral tone of the town so much that now he had practically nothing to do. He told me how the annual St. Mark's Fair in a neighboring town, at which he had been present a few days before, had heretofore been a scene of drunkenness and debauchery. The young men and maidens from farms from all the surrounding districts annually gathered together on that day, and in former years the policemen had been kept busy in stopping fights and quelling disturbances. This year, however, he declared there had not been a single disorderly scene. Instead a prayer meeting lasting several hours was held in the principal church of the village in the afternoon, while at night an open-air Gospel meeting was held, followed by a great revival procession through the town.

While I was still talking to the policeman several large brakes drove by filled with young people returning from a fair at another village, and they were as happy and joyous a group of young men and maidens as one would wish to see. As we looked at the smiling, shouting people the policeman remarked that if I had stood there a year before I would have witnessed a very different sort of spectacle as the young folks rode homeward in a drunken, swearing condition.

One of my most interesting experiences during my journey of investigation was what may be termed a revival journey on a revival train. It occurred during forty miles of my homeward journey after leaving Mr. Roberts. To my surprise and delight I learned that the engine driver, the fireman and the guard of the train were prominent leaders of the revival movement in their respective chapels. The engine driver, Mr. R. Williams, told me with pride that he was a

deacon in the Welsh Calvinistic Methodist Church. He began driving an engine for the London and North-Western Railway at nineteen years of age and is now nearly fifty-nine, having been driving nearly forty years.

It gives one a fresh and delightful feeling of security to know that as one is be-

ing whirled rapidly through space the engine is in the hands of a man of God who has prayed for the safety of his passengers. Such an experience makes one long earnestly for the coming of that golden age when the glory of the Lord will cover the earth as the waters cover the sea.

EAST NORTHFIELD, MASS.

The Engineer's Side of It

BY AN OLD TIMER

[The terrible wreck of the "Twentieth Century Limited" at Mentor, Ohio, not long ago makes the following article by a railroad engineer of especial interest.—
EDITOR.]

WHEN I began firing my first engine, in 1876, I went on the pay roll of an important company for those days. It had about 250 miles of track, which has since blossomed into a "system" with some 2,000 miles of line. There was no "pooling" of engines in those days. Each had her own engineer and fireman, who regarded her as their personal property. Whenever an engine laid in the house for a day after the completion of a trip you could always find her engineer engaged in putting her in trim for the next one. The fireman was also busy, with acid, tripoli, rotten stone and lampblack, cleaning and polishing her Russia iron jacket and brasswork, until the jacket shone like a mirror and the brass looked like burnished gold. A well-kept machine was truly a pretty sight, with her brass mountings everywhere. All this and the copper work must be cleaned and polished; the stack and front end cleaned and painted or rubbed smooth with emery and sandpaper and treated with a coat of tallow. Then the steam gauge, clock, oil cups and other brasswork inside the cab were cleaned and polished. Even the paint work of the cab was washed and oiled, and cab windows cleaned until they were without speck or stain.

It was a disgrace for a fireman to permit an engine to come out of the house unless she looked as spick and

span as a new dollar, for the men took pride in their appearance and performance. The engines on our road were named as well as numbered. We began with the "Pioneer," an old inside connected Taunton, which had been used in the construction of the road, soon after the war; then came the 2 and 3, bearing the names of the road's chief engineer and its headquarters city; No. 4 bore the name of the general superintendent, and No. 5 that of the president; then came a number of prominent directors and stockholders. After them we had the "Antelope," "Greyhound," "Gazelle" and "Reindeer." Next came the names of towns and counties of the State through which the road ran or was expected to run. Increase of business finally compelled the purchase of new engines, and I guess the officials ran out of names, for when the first of these new engines came to the road with only the numbers on them, the absence of names was regarded as a distinct innovation and we all felt that there was something lacking. In those days 12 miles an hour was the limit for freight trains and the management attempted to hold us down to this rigidly. All sorts of tricks were played to steal time, so as to enable us to exceed the speed limit, but we had speed recorders (which we named Dutch clocks) in the way cars, and if an engineer was convicted of exceeding the speed limit he got a thirty-day lay off, and

on repetition of the offense he was very likely discharged. We had a passenger division 90 miles long, and over this we ran a "flyer." This train consisted of three coaches and a baggage car, and we thought her wonderfully fast. Her schedule was three hours and forty-five minutes, including stops, of course, and on portions of her run she sometimes attained the "dizzy" speed of 40 miles an hour. Of course at the low speed of our freight trains we never had to crowd our engines, and as we were seldom overloaded it was no trouble to keep up steam. Trains were also comparatively few, and as congestion of traffic was not a factor we had little difficulty in figuring meeting points, nor were our minds burdened with conflicting directions contained in a great bundle of train orders.

Accidents due to lapses of memory or disobedience of orders by engineers or conductors were practically unknown. We sometimes had derailments, and occasionally collisions due to trains breaking into two or more parts and running together, but butting and rear collisions between two trains, owing to misinterpretation, forgetting or disobeying orders, failure to observe or obey signals or failure to flag, were really unknown. My recollection is that I had been ten years in the service before we had a butting collision, and that was due to a lap order given by a train dispatcher. It was a pretty bad mix-up, but fortunately no lives were lost. I remember that there was great feeling against the dispatcher, who disappeared immediately after the accident. I never heard what became of him.

Gradually, year by year, keeping even step with progress the country over, our methods of operation changed. Roadbed and bridges were improved and strengthened, heavier rails were laid, curves were eased, the line straightened in many places, and grades were reduced. We procured heavier engines, and the tonnage of freight trains gradually increased; the old engines were relegated to branch lines and to service on light local trains. One by one they went to the scrap heap. The Dutch clocks disappeared from our way cars. The speed limit of our freight trains was gradually

increased, to finally disappear altogether, until we understood that when we hooked onto a train we were expected to get it over the division with the greatest possible dispatch; if we failed to make our meeting points we got hurry up orders from the dispatcher and were asked to explain cause of delay. Trains increased in number and size, our time card became more complicated and the line was also crowded with extras. Congestion of traffic became a factor, and the practice of every man following his own engine became obsolete. The engines were pooled and the men became members of the "chain gang."

I well recall our first moguls, which made such a change with us engineers. They were Baldwins. I think it was in 1879 they came. They lacked a great deal of the brasswork of our older engines, and with their mammoth 18 cylinders and comparatively small wheels we looked on them as marvels of power. We had never before seen a Baldwin engine nor one of the mogul type, and, wonder of wonders, these engines were coal burners! I remember that our master mechanic did not dare trust them with any of his old men, and two strange engineers came along from the Baldwin works to take charge of them. With what awe we gazed upon these strangers and their wonderful new machines, and how we used to question the strapping young fellows who had been selected to fire the coal burners! They carried 160 pounds of steam, 20 pounds more than our standard engines, and they used to hook onto 10 or 12 loads more than our standards and "snake" them over the grades with ease—places where our old fellows generally had to double with their smaller trains.

With the coming of the moguls firemen were no longer required to scour and clean. Engineers were no longer held responsible for the running repairs on their engines, because they had no regular engines; it was "first in, first out," for both engines and men, and we seldom had the same engine two trips in succession. Instead of looking his engine over and making repairs, as he had formerly done, the engineer "chalked up" his repairs needed on the board in the engine house, and there were men

whose business it was to make those repairs and look the engines over before they went out. Pumps disappeared, to be replaced by injectors; steam pressure increased, and metallic packing took the place of hemp and soapstone. The sense of personal proprietorship and feeling for our machines disappeared; we gradually became mere cogs in the wheel, and the only interest we had in our engines was to get the work out of them.

With the increase in speed and tonnage, notwithstanding the increased capacity of our engines, we were compelled to crowd them to their utmost. "Nursing" an engine so as to economize steam and get speed and pull out of her became a fine art. We were relieved of the physical labor of looking after the condition of our engines, but the mental labor connected with running them and getting our trains over the road increased enormously. With the great increase in trains, the majority of them extras having no rights except such as were given by train orders, the necessity for caution and watchfulness in reading orders and promptness in executing them greatly increased. Then, too, our "card" trains became more numerous, and we had to figure on a greater number of meeting points for both regulars and extras (I am speaking of a single-track road), requiring finer calculation and greater care to get a train over the road without delay. Owing to congestion of traffic, also, card trains were more frequently delayed, which resulted in masses of train orders affecting the movement of all trains on the division.

In the early days an engineer starting out with an extra would probably get one order at the beginning of his trip. It would read something like this: "Run wild (or extra) from A to Z. Meet extra — at D." This order would take him over the division. He was only required to make his order meeting point and figure out his meeting points for card trains. No worry, no straining, to get his train over the road, and no possible confusion about the rights of his own or other trains. All was simple and plain. But now, how different! Instead of one or two orders it requires a dozen, maybe forty or fifty, for the same trip—regardless orders, time orders, annulling

orders, straight meeting orders, etc., of the 31 and 19 standard forms, each having some bearing on the others, and all having to be kept in mind and watched closely so that there may be no mistake about their accomplishment or the manner in which they affect the rights of different trains. And, withal, we must get our trains over the road with safety and dispatch—principally dispatch.

The increase in mental strain is piled on top of a great increase in physical strain. Whereas we formerly got lay off days, which we utilized for the purpose of putting our engines in shape, we are now continually in the harness, except when we have our names marked off the list for the purpose of getting needed rest—and when business is rushing it is not wise to mark off too often or too long at a time.

We know what it is for an engineer to forget. Lapses of memory on the part of those engaged in most ordinary vocations may be retrieved or corrected, or, in any event, they are not apt to endanger the lives and limbs of masses of human beings. But the engineer's lapse is more than likely to lead straight to death or serious injury to not only himself but to many others whose safety depends upon his care and watchfulness. It is for this reason that the public has been led to consider the mistakes of an engineer as inexcusable, as of more importance and consequence than the mistakes of other men. Yet the engineer is but human. His mind is as likely as that of another man to get on the dead center and refuse to act at a critical time. Why should the public expect more from him than it expects from other men?

For years the idea has been forced upon railroad men that they owe a special and peculiar duty to the public, independent of and paramount to the duties they owe both to themselves and their employers. They have been denied the right to strike to enforce what they have conceived to be their rights except in a manner prescribed by the courts, and only a short time ago an engineer in Pennsylvania was convicted of manslaughter for having slept on his engine, thus causing an accident that resulted in loss of life. The judge refused to consider the plea that the engineer had

been twenty-two hours continuously at work as any justification for his failure to perform his duty, holding that a man has no right to remain at work for so long a time as to render himself unfit to properly perform his duties, no matter what may be the consequences to himself. The court held that the public should be protected and no engineer has a right to sacrifice the public interest to what he may conceive to be his own interest or that of his employers. Theoretically the judge was correct, but practical railroad men will have no difficulty in understanding the impossibility of applying this theory to the exigencies of modern railroading. It cannot be done.

From an experience of thirty years, twenty of which have been spent in active railway service, I have no hesitation in saying that no class of men on the face of the earth have a keener appreciation of their responsibilities than locomotive engineers. "In case of doubt take the safe side" is a fundamental rule of train operation, a rule that is drilled into an engineman from the very moment he begins service as a fireman until it be-

comes a part of his life, a constant admonition to caution. He is drilled to regard the sacredness of a train order, the importance of a strict observance of signals and rules, the great need of caution and the absolute necessity of keeping his wits about him and never forgetting a meeting point nor the slightest detail of an order. He lives constantly in an atmosphere of caution, of admonition. The necessities of his calling, the responsibilities connected with it, become a part of his life. He lives in a world of his own and belongs to a class set apart from other men.

Now, I ask, is not this training calculated to develop men of keen and retentive memory, men who have a minute regard for detail, men who are more likely than others to strictly obey orders and observe signals, men who are unlikely to take unnecessary chances? If the people suffer from the errors of engineers to a greater extent than they believe they should suffer is it not right to take into consideration the services they are forced to perform before pronouncing judgment?

The World's Greatest Problem

BY A. E. WRIGHT, M.D.

LATE PROFESSOR OF PATHOLOGY, ARMY MEDICAL SCHOOL, NETLEY, PATHOLOGIST TO ST. MARY'S HOSPITAL, LONDON, W.

[Dr. Wright is one of the highest recognized medical authorities in England. He is the Pathologist and Bacteriologist of St. Mary's Hospital, London, and was lately Professor of Pathology in the Army Medical School at Netley, and was a member of the Indian Plague Commission. The reader will judge of his radical medical views.—EDITOR.]

BY the accumulated effort of past generations you the reader and I the writer have arrived at the point where hunger, nakedness, exposure to cold and injustice and a civic oppression are to us nothing more than names of unrealized evils—old, forgotten, far-off things. One only of the problems that confronted man at the outset of his race still stands and confronts us practically unabated—the problem of disease. Over the processes of disease we have as yet achieved almost no directive control.

Let us consider how inappreciably little has been done in the matter of lightening the burden of disease. When we look around us we see that a considerable proportion of those who are born into the world die in infancy or childhood. At every successive period of life we see similar wastage. Only a very few accomplish in health the full term of their years.

All this is the handiwork of disease.

There is a further heavy tribute paid to disease in the form of ill-health and lowered efficiency of many of those who

survive. Out of almost every vigorous life there is a tale of weeks or months lost by reason of ill-health. But the most formidable evil occasioned by disease is the uncertainty of life and the resultant waste of human effort. A man addresses himself to his task and, by the labor of years, renders himself "ripe," as Nietzsche puts it, "for the uses of the earth," forms himself into an efficient instrument for executing a particular work, and then, perhaps before he has well entered on his project, he is touched on the sleeve by Death, and the labor of years goes to waste. Or a woman expends days and nights upon the nurture and upbringing of children and, through death, all that labor comes to naught. And it is practically always disease which has done it. The man of affairs will tell you that while you can insure against accident for the price of a song you will have to pay very onerous premiums for insurance against death by disease.

Of all the evils which befall man in his civilized state the evil of disease is thus incomparably the greatest. It ought, accordingly, to loom largest in his mind. In comparison with the chance of winning directive control over this evil every other thing ought to be counted as loss. The cutting off of a day from the Atlantic passage, the supersession of submarine cables by wireless telegraphy, the acceleration of trains and motor-cars, and objects of this order of importance occupy the attention of man. All these ought to be to civilized man, in comparison with any advance in the exploration of disease, as the small dust of the balances—as altogether vanity.

If the belief is nurtured that the medical art of to-day can effectually intervene in the course of disease, this ought to be dismissed as illusion. Putting out of consideration the case of one or two infective diseases which can to some extent be controlled by remedies placed in our hands by chance and, further, the case of diphtheria—a disease for which an effective remedy has been furnished by medical research—it may be affirmed with confidence of the medical art, as at present practiced, that it can do practically nothing to avert death from a

virulent bacterial invasion or to bring about a cure. The thoughtful and conscientious physician has absolutely no illusions on this subject. Confronted with an acute bacterial invasion, he does not conceal from himself, or from others, that he is quite in the dark and that he cannot foresee or determine the issue of the conflict which is in progress in the organism. That conflict will culminate, as the case may be, in the recovery or death of the patient. Fully cognizant of the limits of his knowledge, conscious also of the risks of ignorant intervention, the thoughtful physician dismisses from his mind all idea of active intervention between the organism and the invading germs of disease. He contents himself with laying aside the drugs, which he feels to be useless, and with looking after the feeding of his patient.

A "brainy" American physician told me the other day that it was the opinion of his profession in his country with respect to that Christian science which is the negation of the medical art that if only the Christian scientist had a little science, or the physician a little Christianity, it would hardly matter in serious illness which of the two was called in, provided that the patient had a very good nurse. It is many a true word that is spoken in jest.

Even if the medical art cannot control the bacterial infection it may be suggested that by surgical methods it is now said to be possible to cope effectually with any localized bacterial infection. That claim should be accepted with very respectful reserve. Inquiry should be made whether there is adequate theoretical justification for a method which extirpates the visible nidus of infection only, while invisible germs are left behind in the interior of an organism which has already, in the very fact that it has become infected, proclaimed aloud that it furnishes an eminently favorable soil for the propagation of the particular microbes in question.

If we turn from bacterial infections to diseases produced by disorders of the chemical machinery of the body we are again confronted by the impotence of the medical art. It cannot honestly be said that we have any real knowledge of the morbid chemical processes which are as-

sociated with gout, diabetes or Bright's disease.

If the conclusion is thus forced upon us that the medical art of to-day cannot cope effectually with disease let us turn and consider how far the problem of disease can be solved by the resources of sanitation, meaning thereby all those measures of disinfection, isolation and conservancy which are adopted for killing off the germs of disease outside the organism or, as the case may be, for holding these off from contact with the healthy.

The modern world prides itself on all these measures. That pride furnishes an object for consideration.

Conservancy must be credited with having lightened the burden of disease in the respect that it has, in the towns where it is applied, diminished the incidence of typhoid fever. It has further practically eradicated dysentery. It is doubtful whether much more can be claimed for it. The claim of disinfection and isolation to have diminished the spread of infectious disease is much less clearly established. It would seem that not very much has been achieved by these measures. And it is well to bear in mind in this connection that measures of isolation, disinfection and evacuation, severe beyond any measures that would be endured by any European population, have not, in the case of India, prevented the dissemination of plague all over that continent. It is also to be borne in mind that the program of isolation and disinfection is impracticable in the case of such a widely diffused disease as tuberculosis.

Above all we must keep always before us that the sanitarian of to-day goes about his work with scales of ignorance over his eyes. We do not even know to-day, tho all the world felt that it had certain knowledge on the subject yesterday, whether or no the infection of scarlatina is spread by the desquamated scales from the patient's skin. We are similarly ignorant with regard to the factors upon which the epidemic outbreak of plague depends. We know only that the current statements of the dependence of plague upon filth and of the spread of the infection entirely by rats or chiefly by rats rest on no positive

knowledge. In fact, these statements contain, in all probability, a large element of error. The same may be said with regard to the statements that typhoid fever is spread entirely by water or chiefly by water. It will thus be manifest that, by reason of our present defects of knowledge, the efforts of the sanitarian may quite well, in particular cases, be entirely misdirected.

The statement holds true even in cases where the mode of spread of disease has been definitely ascertained. Even in such cases as malaria, where the source of the infection has, by the memorable work of Ross, been traced home to the infected mosquito, it may, as has been conclusively shown by the careful work of James and Christophers, quite well prove impossible even to reduce the incidence of the disease by the most strenuous measures directed to the destruction of the external sources of infection. In short, the idea that the world will, by sanitation, be purged from the germs of diseases is a dream. That dream of preventive medicine must not hold us back from seriously attacking the study of the processes of disease in the human organism.

Is there, then, in our midst any agency engaged upon the study of the problems of disease? It will perhaps, suggest itself to the man in the street that the whole medical profession is just such an agency, and that our hospitals are institutions in which the study of the problems of disease is actively carried on. This is far from being the case.

Consider the life of the busy general practitioner. He has to go from house to house, from sick bed to sick bed, exploiting in the diagnosis of disease the knowledge which he has acquired in his hospital career and such personal experience as he has since accumulated. His diagnosis made, he applies to each case the accepted method of treatment and passes on. He has neither time, nor training, nor opportunity for research, and no one would wish him to desist from the useful work which lies ready to his hand to undertake research.

The same conditions, or essentially the same conditions, present themselves in our hospitals. It is not within the power

of the hospital physician, giving, as he does, his services gratuitously to his hospital, to devote to its service the whole of his working day. And even if he had his whole working day at disposal, nobody would wish the hospital physician or surgeon to give up to research the hours he now gives to the general hospital work. If he did so, the whole hospital service would come to a standstill, and the patients would be deprived of all treatment.

But, it will be said, there must surely be somewhere a body of scientific workers already at work upon the problems of disease. The fact that new achievements of medical research are from time to time announced in the newspaper press, it will be urged, bears witness to their work. In point of fact, there does exist such a body of workers. They pursue the task of research in the intervals of other work. But their research is carried on under hampering difficulties and with insufficient aid. Nor is it appreciated how small that body of workers is. Among forty millions and more of the British race there are, perhaps, at a guess, a hundred men who can continuously devote to the task of research any considerable fraction of their working day. We may possibly swell out the number of workers by, perhaps, another hundred if we include among those engaged in medical research physiologists, who prepare the way for future medical research by investigating for us the complicated mechanism of the animal body. But we might also, and, perhaps, with equal justification, deduct from the number of those engaged upon medical research, in the restricted sense in which the term is used here, those whose ideas of research are limited to a search for the causative agent of some foreign disease, and who deem that their task has been accomplished when the discovery of that causative agent has been achieved. Medical research proper begins at the point where the discoverers in question leave off.

We are not, in fact, making any effort worthy of the name to solve the problems of disease, and we have not in England any appreciable number of workers engaged upon the task of medi-

cal research. This is due to economic reasons. A young man who proposes to take up medical research as his life-work finds himself immediately confronted in his own person with those very fundamental and primitive problems of obtaining subsistence, and clothes and a shelter over his head. Even if appointed to one of the research scholarships which recently have been founded for the purpose of launching the student upon a career of research the problem will only be staved off a little. When early youth has passed, and physiological wants have increased (and I would not have it forgotten that wife and child and settled home may be reckoned among the physiological needs of man), the scientific worker often finds himself in a deplorable economical condition. He finds that he has embraced a career which carries with it the necessity of struggling day by day throughout life with the problems of the primitive savage, while all around him his compeers who devote themselves to the exploitation of such knowledge as is ready to hand are gaining for themselves every comfort and every reward that civilization can supply. Man after man is warned off by these facts from embarking upon a career of research, and man after man, having embarked upon that career, is drawn away from it.

It would be well if it were realized everywhere throughout the civilized world that every man and woman ought to do something toward making provision against the day when they themselves and those near and dear to them will be in the grip of disease. And in particular the careless rich, who nurture the comfortable faith that when disease arrives Dr. A., or B., or C., whom they know, or, failing him, Dr. X., or Y., or Z., in London, or Paris, or Berlin, will be able to cure their diseases, ought to be disabused of that belief. It would be well for them to realize that the wealth to which they trust to see them through all the eventualities of the future will, when their dark hour arrives, be found impotent to purchase for them any effectual scientific aid against disease. That scientific knowledge which alone can avail in the conflict with disease is—practically all of it—still to seek.

Literature

The Socio-Political Novel

THE spell of great issues comes upon our writers of fiction, and the novels that deal merely with the play and by-play of the eternal game of He and She show a relative decline in number, while an increasing number carry a message of social import. Not many of these latter entirely forget romance and its demands; but in most of them it is subordinated to the dimensions of an incident only. Of the eight novels chosen for mention here* romance has a notable place in but one, *The House of Cards*. In the others it is either absent or so adventitiously — in some cases so feebly — employed as to make its inclusion seem no more than a yielding to fictional traditions.

Each of these writers has a social message. The corruption of business and politics is the general theme, though Mr. Lefevre provides an interesting variant in his picture of the banking oligarchy, while Mr. Scott shows us the labor boss, and the author of *Sturmsee* essays to depict the misguided reformer. Each of

these, moreover, except the latter, may not unreasonably be suspected of radicalism. The things seen are painted in darkest colors, and the implication that only drastic measures will remedy matters is general. But it would be difficult to guess, from these pages, that any of these writers, excepting again the author of *Sturmsee*, has a definite social philosophy. They may be Populist, Socialist, Communist or Anarchist, for all

the reader may discover. They picture what they fear and deplore; but they stop short of a hint of the means of correction. Only the author of *Sturmsee* is definite in his social creed. He is frankly a reactionary, professedly a disciple of Spencer, and doubtless not wholly unsympathetic to Nietzsche.

One wonders why it is necessary in the social novel to employ so generously the

impossible. The truth about politics and business is bad enough, and its careful depiction is sufficient to shake any intelligent person from "the trance of everyday life." Yet nearly all of this group of writers have indulged freely in impossible situations and actions. We may readily excuse Mr. Lefevre for his startling episode of the young man and his fifty-four millions of gold bullion. The thing is a pleasant hoax, brilliantly conceived, obvious enough even for the undiscerning, and employed to point a moral and adorn a tale. But no such excuse can be framed for the utterly preposterous situations in which Mr. Migh-

Edwin Lefevre, author of "The Golden Flood" (McClure, Phillips)

els places his Presidential candidate, or many of the incidents through which Mr. Phillips passes his hero, including that of his presence at the Democratic convention. The attendance of a Mark Hanna at a national convention of the Democratic party manipulating wires for the nomination of a Bryan is a little too much for realistic fiction. Mr. Flower has also built upon a number of incredible instances, and the author of *Sturmsee* piles Pelion upon Ossa by electing a naturalized German, but three years in the country, the reactionary Governor of a Populistic State, and af-

terward marrying him to a German princess. We cannot conceive what end in either art or ethics is subserved by these indulgences in the preposterous.

Sturmsee is the most serious and the most purposeful of these works. It is informed with learning and reflection, and its plan is studiously developed. Yet it would be a mistake to call it a novel. Its characters are such as never were on sea or land, characters who speak not for themselves, but for the author. It is a preachment against reformers, settlement workers, co-operators, trade unionists, Socialists—against virtually all who

Illustration from "The Plum Tree" (Bobbs-Merrill Co.)

are doing something to redress the remediable ills of life as it is. There is much dialog of a kind. But the radicals speak only as the author would have them speak; and their impotent arguments are almost invariably put down by the Jovian utterances of the conservatives. It is a book which leaves a bad taste in the mouth and a sickening feeling at the heart. That such complacent brutality as that with which the author invests some of his characters—invariably those of cultivation, means and social position—can exist in the modern world bodes worse for the world's peace than all the prevalent graft and corruption.

Mr. Phillips and Mr. Herrick traverse much the same ground. Each picks up a country boy and takes him, step by step, to political and commercial power. Each of these subjects finds himself repeatedly, if not constantly, confronted by situations wherein his ethical standards must give way to the exigencies of business, and each as a matter of course finds sanction for his conduct in the maxim that "he must do or be done." Both novels are of the sort to hold a reader's unflagging attention. But the greater art, the truer realism, the more graphic narrative are unquestionably Mr. Herrick's.

Mr. Scott does well with his Buck Foley and his Maggie Keating; not so well, it must be confessed, with his Tom Keating and his Ruth Arnold. Foley, as is well known, is a more or less free personation of Sam Parks; and tho the subjective side of the character is neglected, he is presented objectively in clear and, on the whole, convincing outlines. The tale is an interesting and even powerful narrative of strife in and about a labor union between the forces of graft and those of honesty. The workingmen of the story are generally true types, as should be the case with one who knows his workingmen at first hand. But the author has somewhat overdone the matter of endowing them with faulty syntax and cheap slang. It is not art, but rather the prejudices of a middle-class constituency of readers, which demand such diction from workingmen.

There is not much to be said of Mr. Flower's *Slaves of Success* or Mr. Mighels's *The Ultimate Passion*. The

former is rather a series of sketches than a novel, and the chapters have very unequal merit. Both Azro Craig and John Wade seem to have justified their being, but we cannot see how the various characters in the chapter "The Cupidity of Carroll" can prove themselves ever to have been alive. Mr. Mighels's work seems to us faulty in conception as well as execution, and to serve no particular purpose. The author has done much better work than this and will doubtless do more.

It would be unfair to close this review without a particular reference to *The House of Cards*. The author, who hides a name probably well known by the pen-name of "John Heigh," has written an exceptionally bright and striking story. The corrupt league between business and politics is a leading note, but the strength and grace of the story lie in the narrative of the life and portrayal of the character of Kriemhild West, of the friendship of Eliot and Cards, of the bluff, hearty and honest personality of John Heigh. The author has a style all his own; he has the art of telling a story, of putting each incident, rightly proportioned, in its proper place, of making his characters speak for themselves and justify their existence. And, finally, he can blend social ethics and affairs of the workaday world with the loves and friendships of men and women without spoiling the romance or preaching a tiresome homily.

The Life of Balzac

THE rapidly increasing interest in Balzac has made the lack of a satisfactory biography very apparent of late, particularly in English. Miss Wor-meley's was well enough in its day, no doubt, but it naturally knew nothing of such recent discoveries and investigations as those of the Vicomte de Spoelbach de Lovenjoul, the great Balzac fancier. And it is this new material of various sorts that Miss Sandars* undertakes to compose with the old into a consistent life of the novelist.

There are two periods in Balzac's ca-

* HONORE DE BALZAC: His Life and Writings. By Mary F. Sandars. New York: Dodd, Mead & Co. \$3.00.

reer which were enveloped until late years in well-nigh impenetrable mystery. Born in 1799 and brought up in Tours and Paris to the profession of law, he suddenly fades into obscurity in 1820, to re-emerge nine or ten years later, dragging with him apparently a great bundle of anonymous romances and a tremendous load of debt, of which he seems never to have freed himself. This is the first eclipse, which Miss Sandars, following in the wake of recent discoveries, attempts to irradiate. The second has to do with his exceedingly nebulous affair with Madame Hanska, the Polish countess, whom he met first in 1833 during her husband's lifetime, and who finally married him, after a devious and intricate courtship, in 1850, only a few months before his death.

With regard to the first count it now appears that all this indebtedness, of which his talk and correspondence were full and which was long suspected of being fabulous, has at all events a foundation in reality and was the result of divers business operations and speculations by means of which the young and sanguine Balzac had originally hoped to make himself a position in the world. As concerns the second point, however, explanation is by no means so clear. There is much which is still obscure in Madame Hanska's posture toward Balzac, to say nothing of his feeling for her—and particularly so as Balzac's letters are in many instances the only evidence in the case.

Miss Sandars explicitly disclaims all critical intentions. But her attitude toward her author implies a judgment. And that judgment, it seems to us, errs, if anything, in taking Balzac rather too seriously. It is too obsequious. Balzac, to be sure, is something more than a *farceur*, but he has a way of distorting and magnifying reality. His imagination is at once grotesque and grandiose. He has a taste for heroic caricature, which swells and deforms his own proportions as well as those of his characters. And the difficulty is further heightened by the circumstance that he appears to have had a singular faculty of disordering the imagination of those who came under his influence. From his own report, there-

fore, and that of his intimates it is very hard to distinguish the genuine from the factitious. And Miss Sandars's interpretations fail, in many instances, to make sufficient allowance for the medium through which so much of his biography has come to us.

What Is Protestantism?

PROBABLY most people would say that Protestantism is the religion of Jesus Christ as that religion has come down through the ages, but purified from certain harmful accretions false to its spirit and unfavorable to its growth by the work of Luther and the Reformers, and constantly brought nearer to perfect purity as generation after generation learns better what Christianity was in its earliest forms and corrects the Christianity of the day by that knowledge. A few years ago Adolf Harnack quite stirred the Protestant world by his book, "What Is Christianity?" which was a new effort to separate the kernel from the husk and get at the real heart and vital message of the Christian religion. A good many questioned his results, but most Protestants agreed that his endeavor to get at the core of things was good. As Protestants we have been trained to sweep aside traditions and that itch is in our blood. Sabatier's "Religions of Authority" was accorded about the same welcome, its particular statements questioned, but its basal idea, that Christianity is the religion that was taught and lived in Galilee and not something that has grown up since, met with general approval. So when the Abbé Loisy took his courageous stand for freedom in critical opinion, in "The Gospel and the Church," there was general Protestant agreement that he held the true Catholic opinion in maintaining the right of the Church to develop doctrines and add to her cultus. It was the acceded right of Catholicism to be the religion of the centuries. Protestants were content with the religion of Jesus.

But Dr. Sterrett, of the George Washington University, in an able examination* of these three most important re-

* THE FREEDOM OF AUTHORITY. By J. MacBride Sterrett, D. D. New York: The Macmillan Co. \$2.00.

ligious works of recent years, agrees rather with Loisy, and maintains that Christianity is what it has become, not what it was in the soul of Jesus. Tho confessedly a Protestant, he describes the search for the essence, the kernel, as a vain and foolish thing, and the effort to get back to the faith of the New Testament as a "crab cry." He appears to speak even slightly of the "faith of a Galileean peasant," and yields his homage only to the Logos, the Christ of the Nicene Creed. He insists that Protestantism is also a religion of authority, tho just where the authority for Protestants lies he does not make clear.

The service of his volume is in calling renewed attention to the important works before named. It would appear, however, that the compromise position of Dr. Sterrett is untenable. If Christianity is the religion of the spirit, as the spirit was in the soul of Jesus, the search of Harnack for the real quality of that spirit is very much in order. If Christianity is what it has become, there is no escape from the position of Loisy, and we must include the images and the seven sacraments.

Dr. Sterrett writes entirely from the philosophical point of view, without consideration of the correctness of the historical opinions of those whose views he opposes. Indeed, the critical views involved he does not seem to understand correctly, or he could not write of Harnack and Sabatier as standing upon the same ground as Strauss and Renan. In the matter of the possibility of intellectual knowledge of religious verities he seems to confuse the denial of scientific knowledge with the denial of certainty, and he treats the Ritschlian position to scorn, but not to refutation. Nevertheless his work as a whole is able and it is written with an intensity and enthusiasm of conviction which make it eloquent.

The Stuarts

To the several co-operative histories now in process of publication another has been added which, judging from the first volume to claim attention, Mr. G. M. Trevelyan's *England Under the Stuarts*,* promises to be of unusual worth.

* ENGLAND UNDER THE STUARTS. By G. M. Trevelyan. New York: G. P. Putnam's Sons. \$3.00.

The design of the series, which is under the editorial supervision of Dr. Oman, the well-known professor of history at Oxford, is to utilize the results of the latest research and to tell the story of England as a unified whole, from the earliest times to the battle of Waterloo. It is, of course, impossible to predict in how far the work will escape the dangers common to such an enterprise, and especially the danger of developing into an encyclopedic, instead of a philosophic, history, but if all the writers enlisted follow the lines laid down by Mr. Trevelyan the prospect is certainly bright. Nor has the lightest task fallen to him. Not only does the Stuart era, with its romance, intrigue, bigotry and revolution, mark one of the most important milestones in the progress of humanity to freedom of individual thought and action; it presents problems which, so tinged with partisanship has been the generality of discussions concerning them, still demand settlement. True, much has of late years been removed from the realm of controversy thanks to the indefatigable labors of Dr. Samuel Gardiner, whose contributions to historical literature constitute an enduring and impressive monument to British scholarship, but the last word is far from said. Of the truth of this we are at the moment of writing reminded by the appearance of an extremely clever but not altogether ingenuous study, *The Adventures of King James II.** This is an attempt to reverse the judgment of history concerning the last of the Stuart kings, on the plea that it is unfair to measure him solely by the acts of his three years of kingship, and that in order to arrive at a correct estimate due account must be made of his record as soldier, sailor and civil administrator. The point is well taken, since there can be no doubt that James has received far less than his due from certain of the more important writers, notably among whom we would name Macaulay. But the present apologist unfortunately goes to the other extreme in his laudation of the "best of the Stuart kings," as he chooses to view his hero, and his slavish adherence to James's own memoirs and to the memoirs

* THE ADVENTURES OF KING JAMES II OF ENGLAND. By the Author of "A Life of Sir Kenelm Digby," "Rochester, Etc.," "The Life of a Prig," etc., etc. Introduction by the Right Rev. F. A. Gasquet, D. D. New York: Longmans, Green & Co.

of James's friend Ailesbury stamps his work as an unmistakable piece of special pleading — uncommonly interesting throughout but unconvincing, for the record of James's intolerance, tyranny and folly will not down. Turning to Mr. Trevelyan we find a portrait which, if less vivid, is marked by undoubted breadth and fairness. The adjectives usually applied to the misguided James are conspicuously absent, several of the more unpleasant accusations are ruthlessly brushed away and an appraisal is made which we must regard as eminently just.

Impartiality and philosophic insight are, indeed, the prevailing characteristics of Mr. Trevelyan's work; the exceptions, due it would seem to an unconscious bias, being few and far apart, and of a nature exercising no perceptible influence on the value of the treatise. Recognizing the evolutionary aspect of the hundred years of Stuart rule, the historian, in the endeavor to show how the English people under the Stuarts solved the problem of attaining national unity and power—the same problem which the Continental peoples solved only through military despotism—by means of a free constitution, pays attention chiefly to principles and movements. Measures and men are by no means neglected, but the object steadily held in view is to express in concrete terms the growth of the inner life of the people in its social, religious, political and intellectual manifestations. Beginning with a highly realistic description of the conditions of town and country life at the time James I came out of Scotland, the period is unfolded in a series of dramatic pictures wherein the essentials of spiritual and intellectual change are clearly visualized. Unquestionably Mr. Trevelyan somewhat neglects the more material—and particularly the growth of commerce and of the colonies—but his incisive generalizations respecting economic progress almost atone for the more detailed examination one has a right to expect. His style is decidedly rhetorical, quick with sincerity and atmosphere and of a noteworthy picturesqueness. His scholarship is undoubted, wide and careful reading being coupled with a discriminative use of authorities. For the convenience of students his work carries a bibliography deserving of the name.

Nordenskjöld's Antarctic Expedition

FOR more than a quarter of a century men of science have been casting wistful glances toward the Antarctic regions. The vast area near and below the Antarctic Circle was almost unknown. In the early 40's three scientific expeditions—one British, one American and one French—found lands at the borders of the South Polar zone, and the *Challenger* touched the Antarctic Circle. Except for the reports of these expeditions and those of a few unscientific masters of whaling or sealing vessels the far South remained a mystery. It was, however, a fascinating mystery. The positive magnetic pole of our earth was hidden there, and because of lack of knowledge concerning magnetic activity in southern regions the science of terrestrial magnetism was at a standstill. Moreover, the rich collections brought back by all visitors to the far South suggested promise of extraordinary yields to investigators in every branch of natural science. The curiosity of Royal Societies and Geographical Societies as to the Antarctic regions bore fruit first in a few semi-scientific expeditions; then, in 1898-1899, in an important Belgian expedition, which passed a winter below the Antarctic Circle, and, finally, in 1902, in the dispatch of three parties—one British, one German and one Swedish—to make elaborate investigation of Antarctic conditions. All these parties were to winter in Antarctic territory and to make simultaneous observations, particularly in magnetism. The British expedition was to investigate the tracts south of the Pacific Ocean, the German expedition those south of the Indian Ocean and the Swedish expedition, under the leadership of Dr. Nordenskjöld, a nephew of the famous Arctic explorer, those south of Cape Horn.

The narrative of the adventures of Dr. Nordenskjöld* and his party is the first of the official narratives of these expeditions to be published. It is a tale of hardship, and, in a measure, of defeat. So far as the dramatic effects of polar exploration are concerned—the discovery

* ANTARCTICA: OR, TWO YEARS AMONGST THE ICE OF THE SOUTH POLE. By Dr. N. Otto G. Nordenskjöld and Dr. Joh. Gunnar Andersson. New York: The Macmillan Co. \$5.00.

of new lands, the attainment of high latitudes—the party did not accomplish much. Their field lay among the best known portion of the Antarctic lands, and the northernmost portion as well. At no time did they cross the Antarctic Circle, and their one comparatively short southerly sledge journey did not take them beyond points which had been previously seen, tho not visited. Their main geographical achievements were the filling in of coast lines passed over by their predecessors and in correcting previous charts, which were in a sad state of error. The other scientific results of the expedition have not been digested and published; but if one reads correctly between the lines of Dr. Nordenskjöld's book, the members of the party worked like beavers, and their results seem likely to be of very considerable value; and thus, of course, the main purpose of the expedition is accomplished.

But if they did not winter below the Antarctic Circle, at least they had plenty of thrilling experiences. The landing party was forced to spend two winters instead of one in their little hut; their ship, which was to relieve them, was crushed in the ice, and the crew spent an uncomfortable winter, on short rations, in a dismal stone hut. Three members of the relief party, who had left the ship to make a sledge journey to the headquarters of the leader, spent a still more uncomfortable winter in another stone hut. Here were three divisions of the expedition within a hundred miles of each other, each unaware of how matters were going with their comrades. Two of the parties were anxious about the ship; the third knew that their anxiety was well grounded, that the party was cut off from reasonable hope of immediate succor. And, presto! in one joyful week in spring every difficulty was cleared up. The parties met at headquarters, and a miraculous Argentine ship turned up to take every one home. It was like the last act of a comedy.

The expedition became more closely acquainted than any of its predecessors with the southern territory, for but one of these made sledge journeys—that, of Mr. Borchgrevink, to Victoria Land, in

1899-1900. It brings back more favorable reports than others concerning the lineable character of "West Antarctica" (if we are to adopt the nomenclature suggested by Mr. Balch and Dr. Nordenskjöld, apparently by simultaneous inspiration); it found grass and plenty of land where its forerunners had observed only lichens and ice. But the accounts of cold and storm endured by the Swedes are even more formidable than those of earlier explorers.

Their story is told in a sufficiently attractive fashion, tho it lacks somewhat of the personal touch that ordinarily vivifies narratives of polar exploration. Perhaps this comparative tameness is due to the unusually sparing use of the diary. But even the most commonplace of styles could not make dull reading of the remarkable adventures of the party.

There are two good maps, tho it is to be regretted that they are meager in names. The photographs, however, are inferior to those of Dr. Cook in his account of the Belgica expedition. The colored plates by Mr. Stokes, the American artist who accompanied the expedition throughout the first summer, are excellent.

Saint Elizabeth of Hungary. By Count de Montalembert. Translated by F. D. Hoyt. New York: Longmans, Green & Co. \$2.50.

Montalembert's life of Saint Elizabeth carries one into the spirit of medieval thought so naturally that it is difficult to realize that the facts here given with the glamour of enthusiastic acceptance are the same as set forth in the piteous pages of Kingsley's "Saint's Tragedy." Neither the young girl with her apron of roses, as she lives in the stories for children, nor the woman, worn out at four and twenty, brokenhearted by a false ideal, but the triumphant saint, from whom earthly suffering falls away unheeded before the heavenly glories on which her mind and that of the reader, perforce, are set, is the picture portrayed by the devout Count, whose heart ever dwelt in the thirteenth century. To him that was the golden age. Then the sway of the Mother Church was widest and strongest. Then the religious life reached heights unknown to the lukewarm love of

to-day. Then examples abounded of terrible enthusiasm, such as all forms of religious life can show, but which were especially numerous under the Romish influence of that period. To Montalembert even the mad tragedy of the Children's Crusade is a source of inspiration scarcely touched by pity and with no suggestion of horror.

The Life and Letters of the Great Earl of Cork. By Dorothea Townshend. New York: E. P. Dutton & Co. \$5.00.

The life of the Great Earl of Cork covers a period which Miss Townshend has already made her own in the life of Endymion Porter. The Great Earl belongs to a slightly earlier period, as he was born in 1566, and began his Irish adventures in the year of the Spanish Armada, when Endymion Porter was as yet in his cradle. Until the publication of this volume the Great Earl has been chiefly known to genealogists; and the materials for his life have been found mainly in the Lismore papers, in the possession of one of his descendants—the Duke of Devonshire. From these ten volumes, five containing the Diary of the Earl, and the other five letters from his family and friends, and some of their replies, Miss Townshend has been able to draw a very complete and human picture of the Earl and his surroundings. We see him as a man full of life and energy, of clear-headed shrewdness, of generous kindness, and of quick, hasty temper, tenacious of his rights and ready to fight an unjust claim to the uttermost, but also quick to forgive, and like a "kind fool," to sacrifice the whole advantage for which he had fought out of compassion to his vanquished opponent. Boyle begins life as an adventurer in a new country—goes to seek his fortune in Ireland as a man goes nowadays to the Klondike or to the new Northwest. And he finds his fortune; for tho he landed in Dublin in 1588 with only the wealth he carried on his person—a little money, a good suit and a few jewels—he rose in a few years to be the first Earl of Cork and Orrery, the wealthiest landowner in the country and Lord Justice of Ireland. Nor was his wealth won at the expense

of the country he made his home. The Great Earl grew rich because he created wealth. He was an early captain of industry. He built towns, roads and bridges; introduced better methods of farming; cared for his timber; mined iron, lead and silver, and converted his iron into a wide range of articles from cannon to cutlery. He brought over and settled English tenantry on his lands, and cared for them like a benevolent despot, providing churches and free schools, and seeing to it that neither young nor old suffered for want of employment. But the story is not a simple record of the rise of a great man from poverty to wealth. Through it all runs the sense of insecurity, the high pressure of life, the turbulent excitement and hurly-burly of life in the sixteenth and seventeenth centuries. A man's prosperity is a sure index of the number of his enemies; and enemies enough had the Great Earl, from the time when as a mere boy he appealed direct from his accusers to Queen Elizabeth until he entered upon his long and bitter struggle with Wentworth, the Lord Deputy.

Robert Browning. By C. H. Herford. New York: Dodd, Mead & Co. \$1.00.

There are one or two poets about whom it seems next to impossible to write without absurdity. Shelley used to be such; at present it is Browning. Even Professor Herford, when he enters upon this subject, appears to lose his balance. The necessity to be poetic, to live up to his matter, has been too much for him. As regards his style, it has resulted in a rich blend of sensibility and picturesqueness, like this:

"His [Browning's] imagination flamed forth like an intenser sunlight, hightening and quickening all that was alive and alert in man and Nature; her's [Mrs. Browning's] shot out superb or lurid volcanic gleams across the simplicity of natural chiaroscuro, disturbing the air with conflicting and incalculable effects of strange horror and strange loveliness."

While in criticism it has produced such transcendental jargoning as the following:

"Hence, while 'the finite' always appears, when explicitly contrasted with 'the infinite,' as the inferior—as something *soi-disant*, im-

perfect and incomplete,—its actual status and function in Browning's imaginative world rather resembles that of Plato's *πέρας* in relation to the *ἄπειρον*,—the saving 'limit' which gives definite existence to the limitless vague."

This is too bad of Professor Herford—particularly as his name has sufficient authority to give a kind of currency to this sort of thing among those who know no better.

The Fleeing Nymph and Other Verse. By Lloyd Mifflin. Boston: Small, Maynard & Co. \$1.00.

Mr. Mifflin's poetry is distinguished by its admirable technical qualities. The sonnets by which he has won his reputation are remarkable for the ingenuity and the elaborateness of their art. Indeed, if there is any detraction to be made from his writings it is for their exceeding artfulness that they are to be criticised. It is a pleasure and something of a relief, therefore, to get from him a volume like this, made up chiefly of lyrics, in which technology gives way, to some extent, to feeling.

"Above the woods at close of day
The amber sky was dim,
Through filmy clouds of faded gray
We saw the crescent slim;
But lower, past the maple boles,
A pennant of the West
Flamed like a flying oriole's
Intense, refulgent breast."

Such verses as these may be artful, too; but the art is so simple comparatively as to produce an impression of sincerity, if that is the word, which is not always produced by Mr. Mifflin's more ambitious work.

The Belles-Lettres Series. Browning's *The Blot on the 'Scutcheon* and *Other Dramas*, edited by Professor Arlo Bates; Webster's *White Devil* and *Duchess of Malby*, edited by Professor M. W. Sampson; *Select Poems of Coleridge*, edited by A. J. George, 60 cents each; *The Gospel of Saint Matthew in West-Saxon* and *The Gospel of Saint John*, edited by Professor J. W. Bright, 40 cents each; *Selected Poems of Swinburne*, edited by W. M. Payne; *Robertson's Society and Caste*, edited by T. E. Pemberton; *Chapman's Bussy D'Ambois*, edited by F. S. Boas; 60 cents each. Boston: D. C. Heath & Co.

On the appearance of the first volume of this edition we described at some

length the series, which is planned to include some 200 of the books that are worth while. They are just the thing to carry with one on a journey, for they are cheap, not easily soiled, and light enough to hold in the hand while reading, even in bed. The notes are scholarly without being pedantic, and sufficiently numerous to give all needed bibliographic and interpretive information.

Literary Notes

FOR those of our readers who have a literary conscience that troubles them because they have not read all the great books of the world we call attention to the publications by E. P. Dutton, New York, of the works of Lord Bacon in one volume for \$2.00. It includes the "Novum Organum," the "Advancement of Learning," the "New Atlantis," the "Essays" and many others—all, in fact, of his philosophical works likely to be read by any except specialists, translated and provided with notes and prefaces. The print is small, but that does not matter so much with Bacon, for one does not have to read long to get a great deal to think about.

....In selecting pictures for illustrating Sunday school lessons the "Handbook of Religious Pictures," sold by the New York Sunday School Commission, New York City, for five cents, will be found very useful. All the photographs, engravings and half-tones of the scenery of Palestine and of celebrated paintings, ranging in price from one-half cent to \$20, sold by the various dealers in the United States, are here listed, so that one can find out instantly just what pictures are available on any subject and how to get them.

Pebbles

CONQUERING HERO'S THREE WISHES.—"You have served your country nobly," said the Mikado. "Anything you may ask will be granted." "I have but three requests," answered the Japanese naval hero; "don't erect a triumphal arch, don't present me with a house and don't let the girls kiss me."—*Washington Star*.

....**HIS ACCOUNT OF NO USE TO HER.**—*Mrs. Youngman*: "The idea! it's very funny you can't give me any money. My husband has an account here." *Bank Cashier*: "I know, Madam, but if your husband wanted you to have some money he should have given you a check." *Mrs. Youngman*: "But, my gracious! if he's got an account here can't you charge it?"—*American Banker*.

Editorials

Representative Government for Russia

THE representative government offered to Russia by the manifesto of the Czar is not what was asked for by the conference of the zemstvos, but it is an extraordinary advance on anything that would have been thought possible five years ago, and is not to be scoffed at or disdained. It is to be accepted and made the basis for a really satisfactory constitutional form of government.

By leaps and by bounds has liberty advanced in Russia during these few last years. For it we are to thank in part the feeble indecision of the Czar and in great part the conditions exposed or created by the war with Japan. Solomon was not thinking of the opportunity given for agitation or revolution when he said: "Wo to thee, O land, when thy king is a child and thy princes eat in the morning;" and the blessings of defeat in war have seldom been so exemplified as in the present conflict. In 1896 St. Petersburg was startled by the sudden outbreak of a strike, such as it had never known before. Thirty thousand men in 22 cotton factories were engaged. There was no Socialist propaganda; the Socialists were taken by surprise. The demands were moderate; there was no "revolutionary outbreak," but the workmen gained what they asked and they learned what organization may accomplish also politically. Public sentiment moved forward. Social Democrats and Social Revolutionaries spread their propaganda all over Russia. Between 1895 and 1900 there were 220 strikes, involving more than 200,000 men. Millions of revolutionary sheets in various languages, Russian, Polish, Yiddish, Armenian, were distributed in the factories, in the schools, in the rural districts and in the army. Education went on with amazing rapidity and got its best help from the repressive measures against the Jews, the Poles, the Finns and the Armenians. In 1902 the Czar was persuaded to allow the local councils, or zemstvos, to present suggestions

to St. Petersburg as to what was needed to relieve local conditions of dissatisfaction and unrest. A few answered in a tone that called for their banishment; they had answered questions not put to them; they had asked for representation in the imperial Government. But that they should have been so far recognized that their opinion was asked at all was a great thing, and a greater was to follow in the short space of two years.

In 1904 a Liberal Minister of the Interior, M. Svyatopolk-Mirsky, called a meeting in St. Petersburg of the presidents of the principal zemstvos of the country. He was removed from office and the meeting was forbidden, but it met all the same in November, for the conditions are such now in Russia that men have begun to speak aloud what formerly they dared not whisper to the reeds. This was unlike the meetings in 1902. Then in 400 separate towns 11,000 men had been asked to answer questions only as to local and industrial conditions and needs. Now a representative body of the empire met, 98 leading men present, unlimited in their topics and asserting their freedom of utterance. They met again in large numbers, still forbidden, in March of this year, and again in July. They asked for perfect personal liberty of conscience, of the press and of speech; equal rights for all social orders, enfranchisement of the peasants, and especially "a regular representation in a separate elective body, which must participate in legislation, in working out the budget and in controlling the administration." This was an amazing demand; it asked a peaceful revolution, and the remarkable thing is that this courage had grown in two years and that it was indorsed by every sort of organization in Russia and by what had been the conservative press. The demand could not be safely resisted. A second meeting of the zemstvos in March drew up a plan for representative government.

The official plan now proclaimed by the Czar comes far short of that drawn up by the zemstvos. Suffrage is not universal and voters must be property hold-

ers. The peasants can only vote for local electoral colleges, which will choose members for them. But the principal difference is that the new Parliament, called a Duma, will have absolutely no power except consultative. Whatever they do the Czar may reject. The representatives of the people can simply be heard. They can discuss pretty much everything and have freedom to discuss and advise. This really is all that Mr. Pobiedonostef, who has the credit of drawing up the plan, will allow, for the autocracy of the Czar must not be impaired. But there is advice and advice. Lord Cromer "advises" the Khedive. The Viceroy of India "advises" the Gaekwar of Barfoda. The Japanese have appointed an "adviser" to the Emperor of Korea. There is advice that must be heeded, and it will be a rash Czar who will reject the advice of such a Duma.

But it is amazing that he could have allowed so much. He has let the camel's head into the tent; indeed, he could not keep it out. You cannot stop at the letter *a*; the whole alphabet must follow. Freedom of speech is already largely achieved and the rights of free government follow as a corollary. These are stirring times; history is rapidly making. No man could have anticipated as the result of this war a political regeneration of Russia as sudden and complete as that which we have seen take place in Japan. But here it is, under our own eyes, as sudden and swift as the abolition of slavery in the United States.

A Change of Front Toward Japan

AFTER having for two years shown an almost indiscriminating sympathy with Japan in her contest with Russia, the American daily newspaper press has within a fortnight begun to adopt a tone of opposition which cannot fail to suggest unpleasant reflections. The arguments that are being put forth against the Japanese terms of peace are in themselves unworthy of intelligent men and are discreditable to the American people, if they really represent American opinion.

We do not know whether the news-

papers will prefer to have the public believe that a large sum of Russian money has been judiciously distributed—and unpleasant rumors to that effect have been in circulation—or would like better to be regarded as just plain incompetents, whose editorial comments have the quality of the conversation that goes on within the walls of institutions for the feeble-minded. It is enough to remark that they have placed themselves "up against" this alternative, and if they continue to address themselves on this particular subject and in their present vein to that being whom they are pleased to call "the intelligent reader" they will do so with amazing effrontery.

In saying this we do not here offer to pass any judgment whatsoever upon the justness or the expediency of the Japanese terms of peace. It may be that these terms are both righteous and wise; it may be that they are hard and absurd; we do not pretend to say. We are dealing only with the American newspaper arguments against them. These arguments are in substance two—namely, that Japan is a pagan nation, and therefore, of course, wicked in her dealings with a Christian Power; and, secondly, that if the civilized world permits her to extort these terms from her discomfited foe she will become so formidable an empire that Western interests will be imperiled.

The argument that Japan is a pagan nation has precisely the quality of that criticism which the committee of estimable clergymen made to President Lincoln upon General Grant, that he relied too much on his whisky, and it should be taken in the spirit of Lincoln's humorous reply. If Japan's achievements are a product of her paganism, the sooner the Christian world cultivates that particular kind of paganism the better off we shall be in both morals and worldly success. A nation that can conduct a Government without corruption, keep her word to the letter, do things instead of boasting and in maintaining a vast army on foreign soil lose fewer men by illness than in battle obviously has some of the

qualities that St. Paul recommended in the twelfth chapter of his Epistle to the Romans and which the Christian nations have not been too diligent to remember. Indeed, Emperor William, forgetting his Yellow Peril picture, now says that it is the Christian virtues of Japan that have enabled her to win against Russia.

As for the contention that by extorting these terms of peace Japan will become a dangerously formidable Oriental Power, it is worthy of that particular specimen of the schoolboy who occupies the dunce block. Japan either is a formidable Oriental Power or she is not. If she is, the concession of these terms of peace will not make her stronger; the denial of them will not make her weaker. If she is not formidable she will not be able to hold any nominal advantage that these terms may seem to give her. The real question is, What are her elements of strength and how are they likely to develop? If she has the resources and the military genius to dominate the East any refusal by the Western world to concede the advantages that she has won in the present war will amount to as much as did the withholding from her of the fruits of her victory over China. It is only a question of time when she will get what she wants. If she has the ingenuity and the industry to develop a vast manufacturing activity she will force her way into the markets of the East, whether the Western world wants her to do so or not. If her people have the vitality, the temperance and the frugality to multiply more rapidly than the people of the West, no cry of "Yellow Peril" will prevent their spreading over great areas that are now occupied by less vigorous stocks.

Only one thing can be accomplished by an ungracious attitude toward Japan in the present crisis of affairs. The nations that adopt it can incur her displeasure, as they did after the war with China. She will not retaliate by open hostility, but she will be a less friendly co-operator with them in advancing a policy of fair and equal trade opportunities for all competitors throughout

the Orient, and she will be less disposed to look kindly upon Western influences of every sort, religious, educational and political. The only real "Yellow Peril" is that which lurks in narrow-mindedness and animosity. The Japanese have shown themselves to be friendly in disposition and receptive of all genuine thought, invention and idealism. So long as they care for these things and are willing to do their part in promoting them the Japanese Empire cannot be a peril to any worthy interest.

If the Japanese terms of peace are wrong and unreasonable, let that fact be shown by discussing them on their merits. It is unworthy of the American people to protest against them on the ground that the Japanese are Oriental pagans or that their national advancement is a dangerous rivalry of American interests.

Revolution Within Churches

It is a serious question whether Churches can continue to exist after they have lost their distinctive tenets. Like a building that is shored up, can there be put under them new foundations?

Take the Mormons, for example. In the idea of the public, and indeed in fact, the most characteristic feature of the Mormon Church was polygamy. But polygamy is nearly passed away. So far as its practical bearings on life are concerned, polygamy is becoming obsolete. The rising generation will have none of it; not because it is contrary to the law of the land, but because it is contrary to the law of the human heart. It never worked satisfactorily and never could. A plural marriage still occurs now and then, but the social sense of the Mormon community is against it. The man with plural wives is an object of ridicule to Mormon girls, and the wives themselves are objects of pity. The girls of education scorn the idea of plural marriage, and no more do the young men favor it. It is the grizzled bishop of an earlier day, or the man of wealth and power, who would follow in the footsteps of the elders. But more often than he would have

it known his advances are met with scornful refusal.

But Mormonism survives the death of polygamy. It daily increases the number of its adherents. It holds the affection of its members. Its rule in politics is absolute. Every public school is, outside of two or three larger towns, a church school, teaching religion. There are no real political parties; everything goes as the Twelve decide. All the leading industries of the State, with the important exception of mining, are in the hands of the Mormons. They are not a large body, less than half a million people, below the average in intelligence, but ruled by shrewd, able men, and they are satisfied. The end of polygamy is not the end of the Church of the Latter Day Saints; and the reason seems to be that they have a large residuum of supernatural tenets, sufficient to hold them together, so long as they are believed. The absurdity of the Book of Mormon will one day be recognized and then the Mormon Church will fall to pieces.

Let us take another example: The Jewish Church in this country is very large and strong. It gains hundreds of thousands of adherents every year by immigration. It has perfect freedom, and it is using it. It has two distinctive rites, that of the Abrahamic covenant (circumcision), and the Seventh day Sabbath. What would be the effect of the loss of these two rites?

This is no idle speculation; it deeply concerns all Judaism. Already the seventh day is almost lost. There is a Friday evening service for those that will attend, but pretty nearly every Jew goes to business, and labors and does all his work on Saturday just as he does on Friday. His children attend a Jewish Sunday (not Saturday) school. Sunday is a day of recreation, and Saturday is not a day of worship. Indeed the younger generation is growing up with scarce any distinctive religious training. They are still taught that they are Jews, but they mingle with Gentiles, and see little difference. To be sure the Abrahamic covenant is maintained, more as a matter of racial sentiment, to please the elders, than as a matter of religious obligation. Some advanced Jews venture

to deny the importance of its continuance. It may gradually be lost.

And if the Sabbath goes, and the Abrahamic rite, what will be left of Judaism? If they go it will be because faith in the supernatural history of the Torah has gone before. There will be left no sanctions to Judaism as a religion, and all that remains will be the high ethics which it teaches. Already "Ethical Culture" has its pulpit within Judaism, and the more advanced Judaism differs invisibly, except in name, from Christian Unitarianism. Persecution has kept the Jewish faith strong, but the sun of absolute freedom has, as in the fable, forced off the cloak of ritual conformity, which no blustering storm could remove. There is serious likelihood that gradually, if not rapidly, Judaism as an organized religious force will disintegrate. Now it holds its power by the inherited faith of its wealthy older members and by the admirable character of its organized benevolences.

And what shall we say of the future of the Christian Churches? Their permanence and growth as Churches depends on their faith in supernaturalism. The one or two denominations that deny supernaturalism do not grow. Their young people either leave the Church or go back to a Church that repeats the Apostles' Creed. Our evangelical Churches grow, for they have not lost their faith. What would happen if their members came to a conscious disbelief in supernatural Christianity it is not pleasant to imagine. But we can get some idea of it from the growth and strength of other organizations whose purpose is sociality and mutual benefit, and which already to a considerable extent supplant the Church and usurp its functions. We now have Masons, Odd Fellows, labor unions, granges, and a legion more. They would multiply and grow strong, perhaps form a trust; but the sanction of religion would be lost, and a sad loss it would be to the world. Faith in the world to come has been a tremendous power for fixing and steadying character; and the substitution of the ethics of one's brief life for the ethics of Being and Eternity might make a very serious change in human character and human history.

Tariffs and Exports

At the recent National Reciprocity Convention in Chicago, commendation of the policy of seeking tariff reciprocity by treaty was discouraged because experience has shown that in the present Senate no treaty of reciprocity can be ratified. Conditions in the case of Cuba were exceptional; the rule has been established by the fate of the Kasson agreements. A treaty must have a two-thirds vote; a general bill changing the tariff rates needs only a majority, which would be sufficient for the enactment of such a dual tariff (of maximum and minimum rates) as the convention in its resolutions advocated "as the only practical method of relieving at this time the strained situation with which we are confronted."

When the convention spoke of a "strained situation" it had in mind the new German tariff (which will be enforced in March next), the coming effect of Germany's tariff agreements with other European nations, the attitude of those nations toward the admission of American products, and our approaching harvest, which will give us a large surplus of grain to be sold abroad. Last year we exported only 44,000,000 bushels of wheat (flour included), but this year we may be able to spare 200,000,000 bushels, and a great crop of corn will give us a large surplus of provisions. How are we to retain foreign markets for these products and for our manufactures? How shall we remove or overcome the hostility of those nations which have been led by our own prohibitory tariff rates to raise tariff walls against us? Not by treaties of reciprocity, because the Senate will not accept them. The convention says we must resort to maximum and minimum schedules.

Commercial treaties are friendly agreements; a maximum tariff, with a minimum behind it, is a kind of club. It suggests retaliation and tariff war, rather than friendly exchange of benefits. We do not say that it can be used only as a weapon of commercial warfare; but we think a treaty of reciprocity is to be preferred for solving

peacefully such a problem, for example, as is presented by the action of Germany.

The making of maximum and minimum schedules as they should be made would involve tariff revision. There are some—and they exert much influence—who would retain the present tariff intact as the minimum, and make a maximum by adding 25 per cent. to it. This would not do. It would tend merely to increase the hostility of those whom we desire to conciliate. The present duties are high enough for any maximum that could serve a useful purpose. High and low schedules could be arranged justly and with due regard to the entire situation only by a thorough revision and readjustment of all the existing rates.

This would be a revision of the tariff, and there ought to be a revision of it, for the benefit of the American people in their home market as well as for the promotion of our export trade. Revision should precede—and a fair revision would probably prevent—any experiment in the untried field of maximum and minimum rates. There are many duties that are practically prohibitory. They should be largely reduced. Others, no longer needed for protection, might well be removed. Our exports of manufactures last year were \$543,000,000. They included great quantities of highly protected products which were sold abroad in open competition with the similar products of other lands, and sold not only without the aid of any protection whatever, but even under a handicap of freight charges. If the American manufacturers of these goods can thus overcome the competition of foreign rivals abroad, they can defy it here at home without a duty.

It is our excessive tariff, excluding many kinds of foreign competing goods, permitting the exaction of high prices here, and thus enabling some producers to sell at very much lower prices abroad, that has excited the commercial hostility which is manifested in Germany's new tariff and new agreements with seven Continental nations. "We must not repose in fan-

cied security," said Mr. McKinley in his last public address, "believing that we can forever sell everything and buy little or nothing." Since 1891, Germany has seen her imports from the United States increase from \$96,000,000 to nearly \$225,000,000, or more than 134 per cent., while her exports to us during the same period have remained almost stationary, increasing only 12 per cent., or from \$97,000,000 to \$109,000,000. Buying more and more from us, she would like also to increase her sales to us, but our tariff bars the way. Therefore she seeks exchanges elsewhere, and our large sales of agricultural products in Germany will surely be cut down unless we promote here that exchange which she desires.

Could it be promoted by a maximum and minimum tariff? Probably not by such a dual tariff as those who now control the Senate would accept. A satisfactory readjustment of trade might be obtained by a treaty of reciprocity. Said Mr. McKinley at Buffalo:

"The period of exclusiveness is past. The expansion of our trade and commerce is a pressing problem. Commercial wars are unprofitable. A policy of good will and friendly trade relations will prevent reprisals. Reciprocity treaties are in harmony with the spirit of the times; measures of retaliation are not. If perchance some of our tariffs are no longer needed for revenue or to encourage and protect our industries at home, why should they not be employed to extend and promote our markets abroad?"

But his party in the Senate has ignored the reciprocal treaties negotiated under his direction, and we presume that any new agreement of the same kind would share their fate. Only by a just revision of the whole existing tariff can the fundamental cause of "the strained situation with which we are confronted" be reached and removed. Such revision, necessarily requiring a sharp reduction of many duties, would make a tariff that every advocate of honest and equitable protection could support. If our export trade is to be restricted by foreign legislation, retaliation in any form will probably pro-

vide no remedy. But the losses due to such restriction may reveal the defects of the present tariff to many who do not now see them.

Nagging

IN Rudyard Kipling's latest story, "An Habitation Enforced," in the *August Century*, he alludes to the fall of elm branches in fair weather, and the question of the skeptical reader, "Do elm branches so fall?" was answered in the next number of the *London Times* by the following statement:

"On Saturday, just before my gardeners were due on the path underneath, a huge branch from one of my old elms here crashed down without any warning. There was no air stirring."

Once again the myriad-eyed observer is justified; and we call to mind catastrophes as crushing and as unexpected in the lives of men we know. An astonishing number of sudden revolts, separations and divorces occur after years of passive and uncomplaining endurance. People marvel and say: "He stood her nagging for twenty, thirty or forty years," as the case may be, "I should think he could put up with her tongue a little longer." That is precisely what he cannot do. The hen has never been considered a dangerous bird, but the hen-pecked husband is inoculated with a wee drop of venom at every peck, and he succumbs at last, in a spasm caused by cumulative criticism. The tiny perforations in his soul have been hiding-places for the bacteria of hate, which have silently bred spiteful colonies during slow years.

There are certain poisons, notably lead, whose toxic effect is cumulative. Particles remain in the system, gradually receiving accretions until the accumulated poison proves fatal. Criticism, especially of the domestic sort, usually called "nagging," has like properties. We can brace ourselves against a sudden gust of anger, and spring back to place with the elasticity of all living, growing things, but we must bend to a constant blast of criticism blowing regularly from one direction—bend, or break!

It is often asserted that trouble in gen-

eral and home criticism in particular is a polishing process. That depends. It more often corrodes. And poor human nature, bitten into by acids and rasped by harsh friction, is at last full of unsightly sores, morbid bruises and aching hurts.

There is desperation born of the very persistency of the torture: "Will it *never* end?" cries the victim, and we have here the psychological reason for divorces sought after long years of living in apparent amity. One can endure friction until the sensitive surface becomes raw; then it grows exquisitely painful and one literally "cannot bear it." The meek and "hen-pecked husband" at last may emulate the traditional worm and turn upon his torturer.

Unfortunately, it is usually some of one's own household who knows just where the raw spot in the soul is, and flicks it with a certainty of aim a stranger could never attain. If we have with infinite care blown us a little bubble of happiness or self-complacency it is the one who loves us who pricks the beautiful iridescent thing.

If a manuscript has been returned by the editor, with or without thanks, our neighbors may not know it, but the family will ferret it out and remind us of it by deploring the fact until we are driven to the verge of madness. If the dearest girl in the world sadly says "No" they find that out, also, and wonder endlessly what she could see in that Gibson-statured rival to prefer. "To be sure, he is handsomer than you are, but"—

If you lose a lawsuit, either as lawyer or principal in a case, you literally "never hear the last of it" at home.

A young man was forced into teaching mathematics, against stronger inclinations and greater love for another science, because of a failure to pass an examination in arithmetic in early life. He was so badgered and taunted by his family that in sheer desperation he specialized in mathematics, and even achieved some distinction therein, altho he is still reminded at times of his childish fiasco. But not every young man has so much grit; most of the nagging critics' victims are too hurt, sore and discouraged to attempt further and bolder flights. The wings are clipped and rarely grow again.

Criticism very rapidly corrodes the soul. It needs little enough discouragement. One of the chief obstacles to reform in prisons is that the punishment has destroyed the self-respect to which the reformer if he is to succeed in rehabilitating the man must appeal. Pride has been slowly eaten away, and pride is not a bad thing when it leads us to "conceal our own hurts and not to hurt others."

The nagging spirit is so unbeautiful wherever it appears that we would like to see it kept out of our magazines as well as out of our homes. The "scold" is not a pretty figure, but the attitude of some periodicals suggests her, standing in the doorway, with lean arms akimbo and shrill voice calling the public to hear her vitriolic and vituperative vocabulary of abuse. Mustard plasters will not heal the sores of the body politic, nor will cumulative poisons cure its diseases.

New Theories of Evolution

THE presidential addresses of the British Association for the Advancement of Science are usually of an epoch-marking, if not of an epoch-making, character. The presidents are chosen from the different sections in irregular rotation, and they generally take occasion to give a summary of the recent progress and the present state of their respective sciences. This year the presidential address was worth going to Cape Town to hear, for it was upon the subject of inorganic evolution, by the son of the discoverer of organic evolution. President George Howard Darwin, professor of astronomy and experimental philosophy in Cambridge, is the second son of Charles Darwin, and, in view of the tendency of modern biologists to lay emphasis upon other factors of evolution than natural selection, a tendency which has been jubilantly but unwarrantably heralded in certain quarters as "the death of Darwinism," there was much curiosity to see what view he would take of the controversial situation.

This curiosity Professor Darwin recognized, if he did not fully satisfy, by stating in the beginning of his address:

"It is not my object, nor am I competent,

to examine the extent to which the theory of natural selection has needed modification since it was first formulated by my father and Wallace, but I am justified in maintaining that the general principle holds its place firmly as a permanent acquisition to modes of thought."

He then proceeded to extend the Darwinian law of natural selection to the chemical elements. If, as recent experiments indicate, the atoms of radium and certain other elements are spontaneously breaking up and rearranging to form atoms of a different kind, the chemical elements are not to be regarded as eternal, but as permanent merely because of their stability under given conditions, a stability that might be suddenly disturbed by changes within the atom. According to Thomson an atom consists of thousands of particles of negative electricity moving in complicated orbits at a speed approaching 200,000 miles a second. Such a system, much more complex than the solar system, with only about 300 bodies, might maintain equilibrium for a million years or more, but could not last forever. It must in time decompose and re-form into another atom, which would be tested by natural selection to determine its fitness to survive.

This corresponds, as Professor Darwin pointed out, to a revolution which changes the form of a State, and he continues:

"These considerations lead me to doubt whether biologists have been correct in looking for continuous transformation of species. Judging by analogy, they should rather expect to find slight continuous changes occurring during a long period of time, followed by a somewhat sudden transformation into a new species, or by rapid extinction. The time needed for a change of type in atoms or molecules may be measured by a millionth of a second, while in the history of the stars continuous changes occupy millions of years. Notwithstanding this gigantic contrast in speed, the process involved seems to be essentially the same. The study of the stability and instability, then, furnishes the problems which the physicist and the biologist alike attempt to solve."

Thus Professor Darwin brings into the sphere of evolution the irreducible minima, the supposedly unchangeable atoms, the eternal units of the universe. The latest philosopher arrives at the same con-

clusion as the earliest, at the *πάντα ῥεῖ* of Heraclitus, "Everything changes." Suns and atoms, men and their social institutions, plants and species of plants, all have their life periods, and pass through the successive stages of birth, growth and decay.

Ideas are nowadays more contagious than ever, and a mode of thought prevailing in one science speedily spreads to all the others. So wherever we turn we hear such phrases as "relative stability," "dynamic equilibrium" and "limits of variation" in place of the old terminology implying definite and permanent classification.

Professor Bancroft calls all chemical compounds "phases of matter." Professor De Vries develops new species by catching plants at their "mutation periods." Professor Ross talks of "race suicide," and says "the career of a people is a parabola."

In the days of her infancy sociology borrowed much of her phraseology and theory from the older sciences, especially physiology. Now that she considers herself a full grown science she shows a disposition to pay these early obligations by extending her laws to other realms of thought and even over the whole universe. Almost simultaneously with Professor Darwin's Cape Town address, where he speaks of insurrections inside the atom, Professor Giddings, of Columbia, published quite unpretentiously in *Science* of August 18th a new law of evolution. He holds that the economic laws of increasing and diminishing returns do not apply solely to industrial establishments, but "that they are the laws of universal evolution," and that they are superior to Spencer's famous definition of evolution in that they can be used quantitatively. In their generalized form Professor Giddings words these laws thus:

"In any finite aggregate of competing things or organisms those survive in which the total amount of evolutionary transformation increases more rapidly than the net expenditure of energy; those perish in which the total quantity of evolutionary transformation increases less rapidly than the net expenditure of energy."

Apparently from this Professor Giddings would make efficiency the universal test of fitness to survive, and efficiency is to be determined by the ratio of the energy transformed to the energy dissipated. If this is correct the highest product of evolution in the mineral kingdom would be spongy platinum, which is capable of transforming an unlimited quantity of sulphurous oxide into sulphuric oxide. In the vegetable kingdom it would be an enzyme which can change sugar into alcohol and carbon dioxide without itself suffering change, and in the animal kingdom the neurones in the brain of man, which can control both the platinum and the enzyme with very little expenditure of energy. Or, in other words, the aim of evolution is some kind of catalysis. But Professor Giddings's preliminary notice is so brief and abstract that we must suppress the temptation to comment upon it prematurely and await his further development of this promising theory.

Portsmouth and Shimonoseki

Now when the fate of Manchuria is being decided at Portsmouth it is interesting to recall the prophecy of that shrewd old Chinese statesman, Li Hung-chang. In a letter to one of the advisers of the Empress Dowager, believed to have been written by him almost on his deathbed, in 1901, he said:

"Many Chinese officials contend that Manchuria must on no account be abandoned to Russia. Those who hold this language do not understand the present circumstances, and are unable to look into the future. If we leave the Russians in possession of Manchuria no serious harm will ensue, for in that case friction will arise between Russia and Japan on the frontiers of Korea, and a conflict is bound to break out between the two rival Powers. In the event of war, should things take an unfavorable turn for the Japanese, it will be our business to join the Russians and help them to crush the Japanese, thus establishing a claim upon the gratitude of Russia, who, retaining Korea for herself, will give back Manchuria to China. If, on the other hand, the Russians are unable to withstand the Japanese, we can join with the latter and help them to drive the Russians out of Manchuria. Thus we shall get

back Manchuria without running any grave risks, while in present circumstances it might be difficult for us to recover possession of it."

In foreseeing the inevitable conflict between Russia and Japan and in pointing to the Korean frontier as the inciting cause Li showed himself a true prophet, but in regard to his own country he was much mistaken. So far from joining in to help the winning side, as he recommended, China has taken no more active part than a bone in a dog fight. Consequently she has no claim on the gratitude of either party and she is completely ignored in the conference which is deciding the disposition of her own territory.

Whether the calmness with which Li Hung-chang regarded the seizure of Manchuria by the Russians was in any degree induced by his income from the Russian treasury is not known. In 1898 a censor of high rank offered to prove that Li had received a bribe of \$1,000,000 from the Russian Government, and staked his head against Li's that the charge was true. As a result of the judicial investigation Li lost his head—but only his official one. He was dismissed from office and neither he nor his accuser was decapitated: a verdict which may be taken to mean "guilty but not proven."

But not to discuss further such purely personal matters as the sources of his income, Li Hung-chang certainly showed himself more perspicacious than the representatives of Russia, France and Germany at Tokyo when they protested against the treaty of Shimonoseki on the ground that to give the Liao-Tung peninsula, whereon is Port Arthur, to Japan would be a menace to the permanent peace of the Far East. Two at least of these three Powers which overthrew the treaty which Li Hung-chang had just signed have suffered for their blunder; Germany alone seems to profit by disorders anywhere on the globe.

The result of thus wresting from Japan in 1895 the fruit of her victory was simply that she had to fight again for it ten years later. Now she has conquered the same territory—and a little more, and at Portsmouth, instead of at Shimonoseki, she demands the same concessions—and a little more. If any of the European Powers are tempted again to interfere in behalf of her beaten

foe let them beware lest Japan raise her price in 1915.

Ten years ago, since there was difficulty in making China realize that she was beaten, Japan insisted upon the Chinese envoys coming all the way to Japan to sue for peace. Accordingly Viceroy Li Hung-chang met Count Ito at Shimonoseki, an insignificant seaport town in the eyes of the world, being only five times the size of Portsmouth, but nevertheless the scene of some important events. It was at Shimonoseki that our warships joined with those of the Dutch, British and French to punish the Japanese barbarians for a violation of international law and obtained from Japan an indemnity of \$3,000,000. In those days the Japanese knew nothing of international law and did not want to learn. But we said we would teach them a lesson, and we did, and they have learned it and they know how to ask for indemnity for themselves now. But in time we paid back our share of that fine for the misdemeanor of 1864. The money has been spent for Japanese schools and the incident is all forgotten, or so we hope.

Shimonoseki saw another sight not long ago, when off her coast Admiral Togo demolished the Russian fleet and took into her port Admiral Rojestvensky and some of his best ships as prisoners.

Diplomatic it may have been, but unfortunate it certainly was, that in 1895 Japan compelled China's envoys to meet hers on her own soil, for an ardent young Japanese patriot took it upon himself to avenge his country and shot Li Hung-chang through the cheek. As reparation for this attack upon the sacred person of an envoy under her own protection Japan stopped the march of her victorious armies toward Peking by granting an armistice, which she then, as now, had refused.

This time the peace plenipotentiaries meet on neutral soil, and if a Japanese *soshi* or Russian nihilist should shoot Witte it would not be to the loss of Japan, for we would be the ones to suffer for it.

In other respects, too, Shimonoseki differed from Portsmouth. There the Japanese were twice baffled and the negotiations delayed because the Chinese Government from ignorance or design had

not given its representatives full powers, while on her side Japan was represented by her Premier and her Minister of Foreign Affairs. This time, through a momentary forgetfulness on the part of Baron Komura, the Japanese credentials were left at the Hotel Wentworth until after the Russians had presented theirs. At Shimonoseki the Japanese had against them a former American Secretary of State, John W. Foster. The Russians, however, have not called for the assistance of any of our statesmen as yet.

But whatever be the changes in other respects, we all unite in the hope that the result will be different, that Portsmouth will succeed where Shimonoseki failed, in establishing "a just and lasting peace."

Is It Peace? As we write there is a pause in the negotiations at Portsmouth, and the President is trying to break the *impasse*. No one knows what his suggestion is. Some say it is what we suggested last week, the reference of the points left in dispute, chiefly Sakhalin and indemnity, to The Hague Court for decision. It would be hard for the Czar who proposed The Hague Conference to refuse; but the questions have been declared to involve the honor of the nation, which has been usually reserved from arbitration. We still hope for peace, no matter how much the Russians may say it is impossible. A country is always spoken of as feminine, and we recall her who, vowing she would ne'er consent, consented. Indeed, it looks a good deal like a bluff on the part of Russia. In fact, what can she expect? She can make better terms now than she ever can again. Let her refuse now to make any compromise, and she will lose Vladivostok and the whole Pacific Coast. It looks, we say, like bluff, but no one can prophesy what will be done in St. Petersburg, where

"Chaos umpire sits,

And by decision more embroils the fray."

We sincerely hope that at the last moment Russia may consent to yield Sakhalin, and that Japan may be willing to put her demand for indemnity into such

a moderate form as to save Russia's face.

Education for Show

We have received several letters protesting against the statements in an article about "Education in the South and the Aristocracy." We are not surprised. It represented it to be a current conception of education in the South that it is good chiefly for the show to be made of it, with titles and honors and vulgar display. We by no means indorsed our correspondent's testimony, altho we know that all over the country show of learning is too much the end sought, and even our highest universities solemnly agree how they shall distinguish their professors and students from the common world by their dress. But one correspondent writes from Mississippi:

The South has made wonderful improvements during the past few years. These improvements are made, not by club presidents and "prominent literary figures," but by men and women who spent time in college training themselves to become citizens of the South. The great trouble is that the average Southern parent has not the means to keep his children in college long enough. The great majority of those who have money enough are educating their children. You will find great numbers of students in the Southern schools who are working their way through, just as is done in the Northern schools.

Woman Suffrage Advancing

From all around the world comes news that women are claiming and receiving their equal rights as human beings and as citizens. In Australia the Assembly of Victoria last month passed a bill granting the franchise to women, and Mr. T. Price, the labor leader, who has recently become Premier of South Australia, announced it on August 8th as part of his policy, which has received the approval of the Assembly. In Russia the zemstvoists have seriously considered the propriety of basing their proposed constitutional Government on universal suffrage, in accordance with the petitions sent to them from many organizations in various parts of the empire. Considering the active part the Russian women have taken in the reform movement, from the education of the peasants to the throwing of bombs,

they certainly are entitled to a share in the freedom they have helped to gain. In the mir, or village commune, women who are heads of families have always voted, and if, as has been hoped, an indigenous democratic Government should develop in Russia from the germ of this ancient institution, some at least of the women would doubtless continue to vote. In the plan for a national assembly as drawn up by the Council of the Empire and retained, we presume, in the manifesto now issued by the Czar, women of the prescribed qualifications will have votes, tho they will have to cast them by proxy of husband or son. In Norway the women protested against not being allowed to vote for the separation from Sweden in the recent referendum, declaring that the feminine vote would have been unanimous in favor of it. Woman suffrage is one of the planks in the platform of the Socialists the world over, and in every country their strength is growing rapidly. In England, however, the extension of the suffrage to women property owners is opposed by some of the socialist and labor leaders, who see in it an attempt to increase the capitalistic vote, since working women would not be allowed to vote.

Railway Accidents

It has sometimes been said that the annual deaths by accident on our railroads are as many as in a great battle. This fact is emphasized by the report just issued by the Interstate Commerce Commission. In the year ending June 30, 1904, there were 94,201 casualties to persons on the railways, of whom 10,046 were killed. The number is startling, and suggests the need of some system of greater care. There were 2,114 trainmen killed, and 1,518 watchmen, switch tenders and other workmen. Of these 307 were killed in coupling and uncoupling cars, and 4,074 injured. Of passengers there were 441 killed by collisions, derailments, etc. Of those not passengers or employees, there were 4,749 killed, 804 at crossings; at stations, 458; along the track, 3,446. There is a lesson here as to grade crossings and track walking. For 1895 one passenger was killed for every 2,984,832 carried, and one injured for every 213,651. But the trainmen's lives are much

more endangered. One trainman was killed in every 120 and one injured out of every 9. The use of automatic couplers has saved many lives. We fear that the automobile accidents would show an even larger percentage of casualties and deaths; but we remember that accidents happen to people who stay at home, if they are careless. That is the factor that cannot be eliminated.

Lord Kitchener and Lord Curzon have met and the civilian has fallen. While Lord Curzon is being acclaimed in England as one of the greatest viceroys India has ever had, we may keep in mind that the Indian native does not agree in this respect with the Colonial Briton. He holds that Curzon has been the representative of the doctrine of India for the English, and not of India for the Indian. Even the native princes do not like to recall the expense of their attendance at his durbar, and the magnificent superiority which he assumed as representing the Queen, and their successful resistance to the claim of Lady Curzon to the title of Vicereine. Doubtless he was a British statesman and extended British influence in Afghanistan, Tibet and Arabia, at the expense of the Indian taxpayer, but India did not learn under him to love Great Britain any more.

An interesting example of English insularity of speech is met with in the last number received of the London *Guardian*, which we are inclined to regard as the prince of all denominational papers the world over. Describing the figures on an ancient jar found in Crete it says:

"Behind him, two and two, marching in step, come eight men, wearing the Mycenæan loin-cloth and turbans or flat caps of pork-pie shape."

What shape is that? Probably seven-eighths of those who use the English language never saw a pork-pie and have no idea what is its shape. But the Londoner knows.

It is a rather disagreeable war of personalities that is going on in Geor-

gia between the two leading Atlanta newspapers which represent the two editorial Democratic candidates for Governor, Hoke Smith and Clark Howell. But still more disagreeable is the war over the dispensary in South Carolina, with its charges of petty graft, numerous and definite enough to discredit the claim that graft cannot find a nidus in the same region with lynching.

What a shiver must have run through the session of the British Association in Cape Town when the principal of a South African college told an awful incident to illustrate the moral danger which comes from giving too much education to the natives:

"He had heard of a young rascal, caned several times in the week at school for lying, cheating and stealing, going to a Christian Endeavor meeting in order to pass a note during the opening prayer to his inamorata for the time being."

Those black boys must be sinners of a dye to match their complexion. Who ever heard of such a thing as a white boy passing a note to a girl at church or during prayers?

An "airship" sailed successfully, in a very light wind, over New York last Sunday. But it was nothing more than a dirigible balloon, such as Santos-Dumont and others have made. It is something, but has very little promise of practical advantage, for it will always be very much at the mercy of the wind. What we want is an airship without any balloon. That will be revolutionary, and it will come. What a bird can do with feathers, a bat, a butterfly and a may-bug with vans, a man will yet accomplish.

We believe in Mr. Witte. He represents progressive Russia; and we are sure that he gave a sympathetic audience to the representative Hebrews who sought his interest for their co-religionists in Russia. The newly promulgated provisions for a national Duma do not exclude Jews, and if Witte's voice can control, the laws against them will be removed as fast as possible.

Insurance

Federal Supervision of Life Insurance

If any doubt existed before the conference between Senator Dryden, J. M. Beck and President Roosevelt at Oyster Bay on August 16th, it is now evident that there is a growing sentiment in favor of some kind of Governmental control of life and other insurance companies in the place of the State system which now prevails. With the President's indorsement this sentiment now verges upon crystallization, intensified doubtless because of the abuses that have crept into the supervision by States, which in certain cases have amounted to little less than official blackmail. Looking toward Governmental control some determined efforts to secure it have lately been put forth. Two bills for the Federal regulation of insurance have had recent consideration in Congress. They were respectively introduced by Congressman Morrell and Senator Dryden. Against these bills it was urged again and again that they both originated with the companies themselves. They are, of course, opposed to the hampering restrictions of fifty or more States if there can be secured the substitution of but one supervision, which shall be the Federal Government. From the point of view of the insurance companies their contention is well founded. One evidence of this appears in the item of expense under the present system of State supervision, which has in too many instances passed all legitimate bounds. According to figures presented by James M. Beck, some time Assistant Attorney-General of the United States and now counsel for the Mutual Life Insurance Company, in the *North American Review*, during the year 1902 twenty-eight States received from insurance companies, exclusive of property taxes, over \$5,000,000 in excess of the cost of the supervision exercised by the States concerned. One single State is said to have collected more than the Federal Government requires to examine all the National Banks in the country, and this entire sum, amounting to an annual charge of \$10,000,000 in the aggregate, ultimately falls upon the policyholders. If Federal supervision can lighten this burden it would seem that but little serious

opposition could spring up. President Roosevelt seemed to indorse this view when he said:

"It seems to me that what has occurred to the Equitable Life furnishes another argument for effective supervision by the National Government, if such supervision can be obtained, over all these great insurance corporations which do an interstate business."

The President has now gone even further than this and has expressed himself as heartily in favor of Federal supervision. Senator Dryden will in consequence have the full support of the Administration when his bill in its modified form is reintroduced at the next session of Congress. The Dryden bill as now framed provides for the supervision of insurance by the Bureau of Corporations of the Department of Commerce and Labor. The constitutionality of the measure will, of course, engage the attention of Congress.

THE recent report of Fire Commissioner Nicholas J. Hayes covering the work of his department in the great city of New York is an interesting document. To those whose knowledge of the Fire Department is limited to the chance observation of an engine and possibly its hose carriage dashing rapidly but skillfully to a fire, with the possible sight of a burning building now and then, the report will come as a revelation as to what has been accomplished by the New York Fire Department. A high state of efficiency, vigilance and harmony now prevails in the department. The fireboat fleet has been reorganized and made more effective than ever before and now contains seven fireboats. Further additions to this fleet will be made in the near future. The number of men employed in all branches of the New York Fire Department at the present time is somewhat in excess of 3,500 and is constantly growing.

...Life companies receive many odd requests. According to the *Agents' News-Letter* the claims department of a prominent company recently got this letter from a bereaved widow: "I take pleasure in informing you of the death of my husband, who was assured in your company. Please send me papers quick, so I can prove he is dead."

Financial

Railway Statistics for a Year

STATISTICS of the railways of the United States for the year that ended on June 30th, 1904, were issued last week by the Interstate Commerce Commission. They serve to remind us that we have in this country nearly half of the world's railway mileage—213,904 miles of road, and 297,073 miles of track. The increase for the year was 5,927, the largest for any year since 1890. Some of the Commission's totals are as follows: Locomotives, 46,743; cars, 1,798,561 (those of private car lines not included); passengers carried, 715,419,682; tons of freight, 1,309,899,165; average revenue per ton per mile, 0.780 of a cent, against 0.763 in 1903; capital outstanding, par value, \$13,213,124,679, of which \$6,339,899,329 was in stock and \$6,873,225,350 in bonds; number of persons employed, 1,296,121, a decrease of 16,416; wages and salaries paid, \$817,598,810; gross earnings, \$1,975,174,091 (an increase of \$74,327,000); operating expenses, \$1,338,896,253 (an increase of \$81,357,000); dividends declared, \$221,941,049. Of the entire capital stock, \$2,696,472,000, or 42½ per cent., paid no dividends.

A bulletin of the Census Bureau, also issued last week, makes the commercial value of our railway operating property \$11,244,852,000. This does not include \$123,000,000 for Pullman and private cars. One-eighth of this value is assigned to Pennsylvania, and a little less than one-twelfth to New York.

Practically all of the passenger locomotives and cars, the Commission says, were equipped with air brakes and automatic couplers. The same was true of the freight locomotives and a majority of the freight cars. But air brake appliances were still lacking for 258,808 of these cars. Owing to recent accidents (the collision at Harrisburg, for example) caused by the "buckling" of freight trains, the Commission decided last week to increase the minimum required percentage of air-brake cars in each train.

During the year 10,046 persons were killed and 84,155 injured. Of those killed 441, and of those injured 9,111, were passengers. As 3,632 employees

were killed and 68,067 injured, nearly 6,000 persons who belonged to neither class lost their lives. Probably a majority of these were killed at grade crossings or while walking on the tracks. It is noticeable that the number of passengers killed was considerably increased, having been one for every 1,662,267 carried, against one for every 1,957,441 in the preceding year.

NEGOTIATIONS are in progress for combining the seventeen wholesale drug houses of Canada in one corporation with a capital of \$6,000,000.

....English cotton mills have been making large profits. Those of 21 mills for some time past have exceeded 12 per cent., and recent reports of three show that dividends of 30 per cent. have been earned.

....California's crop of citrus fruits for the crop year beginning with November promises to be the largest on record, and will probably exceed 35,000 carloads, for which the growers will receive about \$12,000,000.

....The cost of steel mills, furnaces and shops either just completed, in course of erection, or for which plans have been perfected, at Pittsburg and in the Monongahela Valley, will exceed \$25,000,000, and they will furnish employment for 23,000 men.

....The *Manufacturers' Record* of Baltimore shows that about 41 per cent. of our exports in the last fiscal year originated in the South. Exports of cotton, cottonseed oil, cottonseed cake and meal, naval stores and phosphates, all exclusively from the South, amounted to \$431,980,911. To this should be added about \$183,000,000 for lumber, tobacco, cotton goods, petroleum, provisions, grain, coal, cattle and fruit.

....Dividends announced:

Atch., Top. & S. F. Rway. (Eastern Oklahoma Div.), Coupons, payable September 1st.

Buffalo & Susquehanna R. R. (Preferred), quarterly, 1 per cent., payable September 1st.

Lord & Taylor (Preferred), semi-annual, 3 per cent., payable September 1st.

NEW YORK, THURSDAY, AUGUST 31, 1905

No. 2961

Survey of the World

The Fusion Against Tammany

It is so clear to the leaders of all the political organizations in this city that fusion is their only chance to win against Tammany that on all sides a willingness is shown to adopt this policy. A first question is, Who shall be the candidate? It is admitted that Mr. McClellan has made a reasonably good Mayor, who, they say, has done as well by the city as any man can while owing a first allegiance to the Tammany chiefs. The eyes of the opponents of Tammany seem to be turning toward Mr. Jerome. It is true that he has said he did not wish to be Mayor, but desired to carry on his work as District Attorney, and that he is as genuine in this feeling as Mr. Roosevelt was in his unwillingness to be nominated Vice-President none seem to doubt. The City Committee of the Citizens' Union held a meeting last Thursday night and, after a warm discussion, by a vote of 30 to 16 decided to favor the nomination of Mr. Jerome. The opponents declared that his nomination would be absurd, that he could not get the support of the workingmen and that there must be a new and strong issue if they expected to beat Mayor McClellan. Mr. Cutting, who presided, left the chair to make a strong speech in Mr. Jerome's favor, declaring that he was the best vote getter with the people. The Republican City Committee met the same day and declared unequivocally for a fusion of all organizations against Tammany, charged the McClellan administration with subserviency to the public service corporations and invited all organizations opposed to Tammany to hold a conference this week. The invitation says:

"The administration of Mayor McClellan

has squarely placed before the citizens of New York City the question, Shall the great public utility corporations continue to control and misuse the government of this city against the interests of all our people and for the sole gain of those corporations and the leaders of Tammany Hall? This question is of such extreme importance to all the citizens of New York as to justify the most earnest effort for a fusion of all elements opposed to the continuance of such a government by Tammany Hall. It is the purpose of the Republican party to effect such a fusion, and to give it full power in the coming election, with the support of candidates pledged to an administration of the affairs of this city under which the public utility corporations will not be the masters of the people of this city."

Some favor ex-Mayor Schieren, of Brooklyn, as candidate against Tammany, but the drift seems to be for Mr. Jerome. Governor Odell says that if thought best he will accept Jerome, altho he would prefer a Republican.

Mayor Woodward of Atlanta

The League of American Municipalities held a session in Toledo, O., last week, which was attended by Mayors and other representatives of most of our leading cities. Among those present was Mayor Woodward, of Atlanta. In the course of a discussion of municipal ownership of public utilities Mayor Woodward began a violent attack on the general movement, which degenerated into incoherent utterance, showing that he was intoxicated, and the meeting abruptly adjourned. The affair has aroused deep indignation and humiliation in Atlanta, where the past weaknesses of the Mayor are well known. He was Mayor a previous term, and

saved himself only by a strict promise to abstain from liquor. At the end of his term he entered into the employment of a company which had secured favors from him during his term, and he secured the solid support of a large contingent of workmen, whose vote at the last municipal election turned the scale in his favor. The proposition now is to impeach him, with every probability that he, tho defiant, will have to yield to public opinion. The Atlanta papers say that his private behavior is no business of theirs; but that when he goes officially to represent the city, his personal indulgences in public meetings become a scandal at home and require stern action.

The President on the "Plunger"

A specially interesting, if not important, event of the week has been the experiments with the new submarine torpedo boat, the "Plunger," in which President Roosevelt took a prominent part. The "Plunger" had been very thoroughly and satisfactorily tested under the charge of the commander, Lieut. Charles P. Nelson, when, at the President's desire, it was taken to the Oyster Bay harbor, and on August 25th the President went on board, and remained on it for three hours during the repetition of the tests. At one time it remained under water for fifty minutes at various depths, while Mr. Roosevelt himself took part in directing its course by pressing the buttons. He had not intended himself to go under the water in the boat, but observing its working, and with the consent of Mrs. Roosevelt, he was persuaded by Lieutenant Nelson to take the venture, and he greatly enjoyed it.

Dr. Booker Washington at Saratoga

The report having been sent to the Baltimore *Sun* that at a Saratoga hotel Dr. Booker Washington escorted a married daughter of John Wanamaker to dinner, while Mr. Wanamaker walked with a gentleman friend, has made so much disturbance in the South, even leading ex-Mayor Drennan, of Birmingham, to resign from the Tuskegee Board of Trustees, that Dr.

Washington has felt obliged to make a public statement. He says:

"I did not escort any female member of Mr. Wanamaker's family to dinner at a hotel in Saratoga.

"During the last fifteen years I have been at the hotel where Mr. Wanamaker was on three different occasions when I was to speak at public meetings, as I was this time, and no comment was made of it.

"When in the South I conform, like all colored people, to the customs of the South, but when in the North I have found it necessary during the last twenty years, as stated fully in my book, 'Up from Slavery,' to come into contact with white people in the furtherance of my work in ways I do not in the South."

The Columbia, S. C., *State* says of this statement:

"What the *State* said in reference to Washington's association with whites in the North still holds good. We are quite sure that no money which is obtained through a commingling on social equality there can compensate for the loss of confidence and good feeling in the South. We are pleased to know, however, that he did not escort any female member of Mr. Wanamaker's family into dinner; we would also be pleased to know that he did not join Mr. Wanamaker's family at dinner."

Various Items

Indictments have been issued against Mr. Holmes, of the Agricultural Bureau, and several New York brokers and others for conspiracy in the matter of the cotton leak. Mr. Holmes avoided arrest until the beginning of this week, altho officers were in search of him.—Mr. Knabenshue's dirigible balloon made two very successful ascents over New York last week. The movement of the balloon was followed by eager crowds, stimulated by the announcement that one hundred dollar bills would be dropped into the crowd from the balloon.—The Marine Hospital surgeons seem to have the yellow fever epidemic so far under control in New Orleans that they promise that the fever will be checked before frost naturally stops it. At present the city has itself proclaimed a quarantine against fresh cases of infection out of the city, inasmuch as Baton Rouge and half a dozen other towns on the Mississippi have been found to develop nests of fever. Especially are the States of Mississippi and

Alabama stringently enforcing the quarantine.—The cause of the terrible explosion on the gunboat "Bennington" at San Diego, Cal., July 24th, by which scores lost their lives, has been investigated by a court of inquiry ordered by Secretary Bonaparte. The court finds that it was due to the carelessness of a fireman, who closed a valve instead of an air cock, which caused the steam gauge to cease to register. But while the pressure increased the machinist's mate in charge failed to observe conditions, as did the others under him, and that the explosion was to be expected when the fires became hot. But those chiefly responsible are dead. This accident will lead to a movement to revert to the old arrangement before naval rank was given to machinists.—The President has decided not to call an extra session of Congress.

**Death of
Mrs. Dodge**

Mrs. Mary Mapes Dodge died last week. She was an early writer for THE INDEPENDENT in prose and verse and it was at the request of the editor of THE INDEPENDENT that her most famous story, "Hans Brinker; or, The Silver Skates," was written in 1865. She became one of the editors of *Hearth and Home* in 1870, and in 1873 was chosen editor of *St. Nicholas*, choosing its name, and continued in charge from its first number.

**The Taft
Tour**

Secretary Taft and his party have completed their tour of the Philippines in the transport "Logan" and returned to Manila. The visit to the southern islands was marked by many picturesque incidents. At Jamboanga the transport was met by hundreds of proas, and the party received at the pier by 2,300 Moros, representing ten different tribes. A parade, fencing bouts and a baseball game between a Filipino and Moro team occupied the afternoon, and in the evening there was a boat parade and a sham battle with canoes. At Cebu they were met by a procession of 2,000 school children. Visits were paid to the Magellan Monument on the island of

Macton and to the sugar and hemp plantations. The Congressmen contributed \$150 to the famine sufferers here. At Jolo Miss Alice Roosevelt made such a favorable impression upon the Sultan of Sulu that he proposed to add her to his harem, and presented her with a pink pearl. The gift was accepted, but the offer of marriage was declined. The Sultan received the party in the open fields outside the walls of Jolo, where 8,000 Moros mounted on decorated ponies were assembled. The entertainment consisted of native sports, including a spear dance and a bull fight. It is explained that the Moro bull fight is not, like the Spanish, of a sanguinary character, but consists of a pushing contest between carabaos led by ropes. On August 31st the party sails for Hongkong, where they will separate. Secretary Taft and most of the Congressmen will sail on the Pacific Mail steamer "Korea" for Yokohama and thence to the United States. Miss Roosevelt and her companions and Senators Newlands and Warren and Representatives Longworth, Gillette and Cockran will go to Peking to be entertained by the Empress Dowager of China, and will sail from Yokohama October 7th.

**The Peace
Conference**

Whether there has been any progress made toward peace during the past week cannot now be said. The plenipotentiaries at Portsmouth have held few conferences, and these, so far as known, have been fruitless. Nevertheless there has been great activity outside the conference room which may have been more profitable than the discussions of the envoys. President Roosevelt has energetically continued his efforts for peace, and has had frequent communications with Portsmouth, and has appealed directly to the Czar. On Wednesday, August 23d, Ambassador Meyer spent three hours at Peterhof with the Czar, but nothing has been given out as to the nature or results of the interview. It was reported that the President urged concessions on the part of the Japanese in regard to Sakhalin and the indemnity and their ac-

ceptance on the part of Russia; that he suggested some new form of compromise and that he recommended the submission of some of the points in dispute to The Hague Court. Mr. Witte has denied all these reports in regard to the President's action, and also states that he has not asked or received from his Government any further instructions. Whatever may have been the cause, the Japanese envoys have shown during the week a willingness to continue the conference and make concessions. On coming together on Wednesday, the first session of the week, it is understood that Baron Komura offered to concede two of the four points on which there had been disagreement and to compromise on the other two. He agreed to give up the demand for a limitation of Russia's naval power in Pacific waters and for the Russian ships of war interned in neutral ports, and in place of an indemnity or reimbursement for the cost of the war proposed that Russia should pay 1,200,000,000 yen (\$600,000,000) for the northern half of the island of Sakhalin. This was rejected by the Russian envoys, who maintained their position that no indemnity or remuneration for Japan's expenditure for the war would be paid under any name, because it would be virtually admitting that Japan had been right in making war. Mr. Witte stated that Russia would pay gladly and liberally for the care of the Russian prisoners and wounded during the war, which is estimated at \$50,000,000. It is also believed that he expressed himself willing to concede the southern half of Sakhalin to Japan, thus restoring the status that existed prior to 1875, when the island was divided between the two Powers. Japan, however, insists upon the payment of the costs of the war by Russia as a matter of principle, these costs to date being estimated at \$900,000,000. As there seemed no prospect of an agreement the secretaries were instructed to prepare the final statements of the minutes of the meeting in French and English, and the conference adjourned to give time for this. On Saturday these protocols were

signed, and a private informal meeting was held by the four envoys from which even the secretaries were excluded, after which Mr. Takahira asked that another meeting should be held on Tuesday afternoon. This was agreed to by Mr. Witte.—Prince von Bülow, Chancellor of the German Empire, in response to an inquiry as to the attitude of Germany, made the following statement:

"Since the beginning of President Roosevelt's action the German Emperor, as well as his Government, has never ceased to advocate the cause of peace wherever an opportunity offers itself. Germany is interested as well as America in putting an end to the risks and uncertainties inseparable from every great war. The Emperor and the German people cordially wish that President Roosevelt's efforts may be successful."

Le Matin, a Paris paper, has telegraphed to Mr. Rockefeller, as "the richest citizen of the world," asking him "to remove the sole obstacle now hindering peace" by paying the amount in dispute between the peace commissioners.

The Anglo-Japanese Alliance The announcement is made that a new treaty of alliance between England and Japan was signed three days before the adjournment of Parliament and that the new treaty is wider in scope than the former one, but its provisions will not be given out until after the conclusion of the Portsmouth Conference. It is believed to include a recognition of a Japanese protectorate over Korea. The old alliance was purely a defensive one, providing that if either Great Britain or Japan were attacked by two Powers her ally would come to her aid. The new alliance may provide for common action for both defensive and offensive purposes. The reason why the Balfour Government refused to resign, altho discredited in Parliament, is now believed to have been because of the desire of the King to have the present Ministry complete the negotiations for this treaty, which might not be regarded with so much favor by the Liberals if they came into power. The announcement at this time of the signature of the

treaty is doubtless for the purpose of influencing the peace negotiations.

The Interparliamentary Congress

Last year the Interparliamentary Congress met in this country at St. Louis, during the Louisiana Purchase Exposition. This year it meets at Brussels, on August 28th, with fuller attendance of representatives of European legislative bodies than before. The Italian Chamber of Deputies sends 100 delegates, the British House of Commons 30, the French Chamber of Deputies 40. Among the Americans present are Representatives Burke, of South Dakota; Bates, Barchfeld, Dickerman, Moon and Palmer, of Pennsylvania; Boutell and Fuller, of Illinois; Goldfogle and Waldo, of New York; McNary, of Massachusetts; Norris, of Nebraska; Bartholdt, of Missouri; William Alden Smith, of Michigan; Slayden, of Texas; Wood, of New Jersey; Littlefield, of Maine; ex-Congressman Barrows, of Massachusetts, and Hayne Davis, of New York. The American delegates held a preliminary meeting and adopted two resolutions, one congratulating President Roosevelt on his efforts in the cause of peace, and the other asking the Norwegian Government to confer the Nobel Peace Prize upon Mr. Bartholdt for his efforts in behalf of arbitration. The draft of the model arbitration treaty drawn up by Congressman Bartholdt and presented to the Executive Council of the Congress is as follows:

"Article I.—All differences which grow out of the interpretation or enforcement of treaties, which concern diplomatic or consular privileges, boundaries, rights of navigation, indemnities, pecuniary claims, violations of the right of person or property, violations of recognized principles of international law, shall be tried by the International Courts established under this treaty and the treaty of The Hague.

"Article II.—All other questions of whatever character shall be referred to a Commission of Inquiry, constituted according to the provisions of the treaty of The Hague, or to a court constituted as provided herein and decided on appeal by a court of the Permanent Tribunal at The Hague, before resort to arms. Alleged violations of this clause shall be tried by the International Courts as provided for questions included in Article I.

"Article III.—Upon filing of a statement of its contention in a case of the kind included under Article II, either Power may serve notice that it will be proper for its treaty making power to accept or reject the decision; otherwise it will be considered that the decision of the courts shall be final as in cases coming under Article I.

"Article V.—There may be an appeal in all cases to the High Court of The Hague, unless the decision is unanimous, the question pecuniary and the amount adjudged is less than \$1,000,000. There must be an appeal to the High Court of The Hague before exercise of the right to resort to arms; for such right shall hereafter be exercised only after a decision by a high court of The Hague tribunal, either upon original hearing of a controversy or upon an appeal from a Commission of Inquiry or from a Court of First Instance.

"Article XI.—The number of judges to be selected for the trial of any controversy shall be five, unless otherwise agreed by the parties, or unless the number of nations in a case before the Court of First Instance necessitates for such case a larger number, and decision shall be by a majority of judges.

"Article XVI.—Nothing herein shall prevent entire freedom of action by all signatory Powers in a matter which concerns a Power not a signatory hereto. (This preserves the Monroe Doctrine.)"

The references to President Roosevelt in the opening address of Minister of State Beernaert were heartily applauded and the first action of the Congress was to send the following message to Oyster Bay:

"The Interparliamentary Congress at Brussels assembled sends greetings, and has the honor to advise you that it has passed resolutions expressing its high appreciation of your action in calling a second conference at The Hague in the interest of international peace, and its profound thanks for your noble efforts in the interests of humanity to terminate the Russo-Japanese war."

In Russia The reception given to the Czar's call for a Duma, or advisory assembly, instead of the legislative body asked for by the Liberals, is distinctly unfavorable, altho all expressions of disapproval are rigorously repressed by order of the Czar. The Central Committee of the Federation of Professional Societies was meeting at the house of the President, Professor Milyoukov, at St. Petersburg, to organize a campaign against the Duma project,

when the police entered and arrested all the members. Professor Milyoukov is well known in this country, where he lectured at the University of Chicago, and some account of his literary work is given on page 515 of this issue. Henryk Sienkiewicz, the Polish novelist, whose novels "With Fire and Sword" and "Quo Vadis" are very popular in this country, has also been arrested and imprisoned in his own house for protesting against the Russification of the Polish schools. A general strike of railway men and factory employees had been ordered in Warsaw, Lodz and other Polish cities as a protest against disregard for Polish rights in the plan for the Duma, but it did not last long. The revolutionary socialists are organizing demonstrations against the Duma in many parts of the country. The Municipal Council of Moscow passed a resolution to the effect that while the municipality appreciated the value of the Duma as a preliminary step, the noble purposes of the imperial act were possible only under the conditions guaranteeing freedom of speech and press and meeting and the inviolability of the person. The resolution was received with applause. The meeting empowered Prince Galitzin, the Mayor of Moscow, to convey to the Czar the expression of its opinion.—The Minister of the Interior has issued orders to the prefects limiting their powers to punitive authority, which, if carried out, will insure the independence of the peasant communes in the election of their representatives to the Duma. The peasants will have altogether 2,505 electors for the Duma; the land owners, 1,912, and the cities, 1,354. In the eastern provinces the peasant class will be predominant and they are likely to be in a majority in the new national assembly. Only 9,500 persons in St. Petersburg, including 137 Jews, will have a vote for representatives to the Duma, altho the population of the city is 1,500,000. Moscow, with a population of about 1,000,000, has 11,000 voters.—Minister of the Interior Bulygin, who drew up the original plan for the Duma, has resigned. Count Alexis Ignatiev and General Trepov are suggested as candidates for the position.—In the Caucasus peasant riots are becoming more common and serious. The

peasants on some estates compelled the nobles under threats of death to divide part of their estates with them or have refused to pay the usual fourth of their crops for rent. Some of the peasants are willing to pay a tenth, others nothing at all. On the estate of Prince Mukhransky the ringleaders of the peasants, who had been arrested by the police, were released by a mob of peasants, who held their ground until charged by the Cossacks, who had been sent to the district. In the Baltic provinces political murders and riots instigated by the revolutionary committees are frequent.—The court martial of 133 mutineers of the battleship "Kniaz Potemkin," which raised the red flag in the harbor of Odessa, has been completed. Eight of the prisoners were sentenced to be shot, but it was recommended that this sentence be commuted to life imprisonment. Of the others 19 were sentenced to various terms of imprisonment at hard labor.—Both the Russian and Japanese armies in Manchuria profess themselves eager to continue the war and confident of victory, and telegrams are repeatedly sent to Tokyo and St. Petersburg protesting against a premature peace. The rainy season is now over and a failure in the Conference at Portsmouth would probably be followed by operations on a more extensive scale than ever before. The Japanese have completed their lines of connection between the Yalu River on the frontier of Korea to Kai-Yuan on the railroad from Harbin to Port Arthur.

England's Food Supply

Since England is dependent upon other countries for five-sixths of her food, the question of what would happen in case this supply is cut off or interfered with by war is a very serious one. Japan and Russia have been able to carry on a war for over a year and a half without suffering from famine or even from unduly high prices of food, but it is evident that for England a long war would be an impossibility unless with a nation whose naval power was very insignificant. The Royal Commission, which was appointed in 1903 to study this problem and to recommend remedies to Parliament, has just published its report.

The Commission included Lord Balfour as chairman, the Prince of Wales, members of Parliament, financial and legal experts and an admiral of the navy, and they held fifty sittings and examined ninety-three witnesses. A large amount of valuable information was collected, but the members of the Commission were not able to devise any solution of the problem or even to agree upon any important recommendations. Only three out of the seventeen members signed the full report; all the others expressed reservations or presented other plans. The Commission found that the supply of cotton ordinarily on hand would suffice to keep the mills going for seven months, but that at times it has fallen to an amount insufficient to last longer than two and one-half weeks. The steel manufacturers require 71,000 tons of manganese a year, of which only two months' supply is in the country at any given time. Other manufactures are also supplied only a few months in advance, and a war would soon involve the closing of these and the throwing of the operatives out of employment, and the interference with the export of products would check those manufactures not so dependent upon foreign raw materials. But the food question is far more serious. Meat, eggs and dairy products could possibly be dispensed with, but bread at least must be had. The weekly consumption of wheat and flour in the British Isles is 150,000 tons, and the stock of these varies from about seventeen weeks' supply in September to less than seven weeks' supply in August. It is improbable that any war could altogether cut this off, since it is now derived from several sources. Five years ago Great Britain obtained 62 per cent. of her wheat and flour from the United States, but in 1904 this was reduced to 15.9 per cent., the balance being mostly procured from Canada and the following sources: India, 21 per cent.; Russia, 19 per cent., and Argentina, 18 per cent. Nevertheless the effect of a declaration of war would be to cause an immediate and great advance in prices, which would bear heavily upon the poor. Two remedies, or, rather, palliatives, are suggested, that the Government subsidize in some way the storage of grain or insure transport vessels

against capture by the enemy. It is thought that to have the Government buy, store and sell grain would be dangerous to commerce and liable to abuse, but if granaries were provided by the Government rent free the stock kept in the country would be increased. It is calculated that the expenditure of \$75,000 a year would store enough grain to last one week longer. In regard to marine insurance the Commission favored the indemnity scheme, by which the Government should make good to shipowners and shippers all or part of their losses by capture during the war. This, it is argued, would prevent a loss of the carrying trade and an abnormal rise in prices due to heavy war insurance. In opposition it is urged that there would be great opportunity of frauds on the Government from excessive valuation and even the intentional exposure to capture of worthless vessels.

Recent Fetes at Vevey

From an artistic point of view the most important of all the spectacles held in Europe this year has been the *fête* at Vevey, Switzerland. For three centuries and a half the vine growers of Vaudois have been organized to encourage the growth of the vine in their canton, and for nearly as long Vevey has been the scene of festivals held at varying intervals, in which the success of the vintage has been celebrated with something like Bacchic fervor. For many years these celebrations were purely local, they are still predominately so in all that concerns the conduct and management of the *fête*, and a Vevey tradition has grown up which is carefully cherished, but the audience is no longer confined to the little town or to the canton; the *fête* is a national event. It is now conducted on such a scale of magnitude, labor and expense that it can only be held at long intervals. The dates of the four previous celebrations were 1833, 1851, 1865 and 1889. In 1797 the expense of the *fête* did not exceed \$640; in 1851 it rose to \$12,970, in 1865 to \$28,000 and in 1889 it reached \$57,000. The number of spectators likewise increased; in 1851 it was 60,000; in 1889, notwithstanding the Paris Exposition was held the same year, the number of

spectators rose to 100,000. This year the spectacle is said to have cost \$100,000, and the number of spectators could hardly have been less than in 1889. Six representations were given in the amphitheater, seating 12,500 people. A correspondent of THE INDEPENDENT who was personally present reports that from an artistic and dramatic point of view the great spectacle was one of the most imposing and dignified that he had ever witnessed and that it was well worth crossing the ocean to see. To the old ballads and songs of Vaudois have been added modern music of a high order, composed by a young Swiss, who has already made a name for himself, Gustave Doret. The celebration is essentially a Swiss event, in which pastoral and rural life are idealized in a manner to render glad the heart of Virgil or Theocritus. The four seasons, beginnings with winter and ending with fall, were each represented in tableaux and song and dance, and the life of the sower, the reaper, the herdsman and the vine grower was depicted with charming episodes of rural recreation and scenes of domestic bliss. The best of it all was that it did not celebrate a traditional life alone, but brought out the poetry of the every day occupations of the peasants who took part. The costumes and the dances were of exquisite grace and beauty and the setting of the stage and the construction of the poem by René Morax were triumphs of art. Eighteen hundred actors and musicians took part, and in addition were flocks of sheep, herds of cattle, and various floats bearing the Goddess of Spring, the Goddess of Summer and the youthful Bacchus. The dance of the dead leaves was worthy in beauty to be compared with the dance of the flower girls in "Parsifal."

Norway and Sweden

The Norwegian Storthing has formally requested Sweden to co-operate in the dissolution of the union, and Commissioners from the two countries, meeting at Carlsbad August 31st, will negotiate the points in dispute. It is understood that King Oscar is no longer opposed to the acceptance of the Norwegian crown by his son Charles. The following Com-

missioners have been selected: For Sweden: Christian Lundeberg, the Premier; Count A. F. Wachtmeister, Minister of Foreign Affairs; M. Staaf, member of the Cabinet without portfolio, and M. Hammarskjold, Minister of Education and Ecclesiastical Affairs. For Norway: Premier Michelsen, Foreign Minister Loevland, C. C. Berner, President of the Storthing, and M. Vogt, former Minister of the Interior.

France and Morocco

The Moroccan situation has become complicated by the arrest at Gharb, a town of Morocco not far from the Algerian frontier, of an Algerian merchant named Bouzian for some local disturbance. The French Government made a demand for his immediate release on the ground that he was a French subject. The Moroccan authorities refused to comply, the Sultan claiming that as Calif of Islam he had jurisdiction over all the Mohammedans in Morocco regardless of nationality. The French Minister at Fez, M. St. René Taillandier, thereupon gave as an ultimatum to the Sultan a demand for the release of Bouzian and the payment of an indemnity of \$2,000 for the outrage and of \$100 for each day of delay. So far the Moroccan authorities have shown no disposition to comply, and a military demonstration by the French troops on the Algerian frontier is likely to be the next move. The French headquarters is at Lalla Marnia, and from this point it would be easy to throw troops across the frontier and occupy the Moroccan town of Ujda, only 16 miles away. From this point to Fez is 200 miles, and it would be easy to threaten the capital. A naval demonstration in the bay of Tangier, such as was effective in securing the release of Mr. Ion Perdicaris, will probably be avoided, as Germany might in that case take occasion also to send ships to watch operations. It is not known whether the attitude of the Sultan is due to German influence or not. Ostensibly Germany approves of the French demands, altho the French Government has not asked for such approval.

Do Animals Reason?

BY PETER RABBIT

[We take it that "Peter Rabbit" did not actually write the article under his name, but on his haunches in a brier patch talked it to his friend, William J. Long, who took it down and sent it to us. Mr. Long is an intimate friend of the creatures of the woods, as all lovers of wild things know from his popular books, one of which is "Secrets of the Woods."—EDITOR.]

THERE was a certain professor, of whom the rabbit has heard, who used to demonstrate to his psychology classes that animals do not think, and this was the method of his proof: He had first confined a kitten in a cage, keeping food just outside a trapdoor, which he opened at intervals, and had continued the training until the kitten when hungry would always go to this particular door and wait to be fed. When the process was completed he brought the whole outfit into his psychology class.

Here the rabbit ventures to state the pretty little problem as it was presented to the truth seekers. Given the cat *a*, the cage *b*, the door *c*, the food *d*, we are to prove from *b*, *c* and *d* that *a* does not think. For such is your naïve conception of experimental animal psychology. You begin, of course, by assuming what you wish to prove: That the cat is a mechanical arrangement, with no more individual will than the lines and angles of a parallelogram.

While the class waited expectantly the hungry kitten was placed in the cage, the trapdoor was closed, and food was placed just outside. The rear of the cage was then taken away, but the kitten stood mewling at the usual door. Next the top and then the sides of the cage were removed, till only the front was left between the kitten and the food; but still she waited at the door and refused to go around to eat. Therefore, said the professor, animals do not think; they are altogether creatures of habit and reflex action. In a word, they are not willful animals, but *automata*, the *bêtes machines*, as the Belgian hare says of Descartes's ancient and primitive philosophy.

Now to a rabbit that looks like strange doctrine to be dispensed even to those guileless young men who study psychology in a monkey cage at the College of Educational Notions. There are also some things about it that need a commentary. The rabbit has ventured to

show, in another meditation, that while wild animals have undoubtedly strong natural tendencies they are probably far less governed by senseless and outworn habits than are men. You can, of course, make a fool of any cat or dog or child by judicious training; but only a human and very modern psychologist would ever infer from this proposition that animals and men are governed by reflex action. Suppose, for instance, that your professor had put in the same cage any ordinary hungry cat that had not received the benefit of his training, and after taking away one side of the cage the cat had promptly made her way out and eaten the food. Would that be a demonstration of the fact that all animals think and are therefore rational creatures?

The rabbit knows one very intelligent dog that, without training, will take no food from strangers, but only from certain people whom he trusts. Perhaps in her heart the professor's cat was but waiting for the hand that loved her to open the door. In that case we are justified by experimental psychology in claiming as a proved fact that "better is a dinner of herbs where love is than a stalled ox and experiments therewith." Certainly, from what he has seen of cats, the rabbit is forced to the conclusion that if the misguided kitten had been left to her own mother's training she might have fared better and have shown more intelligence than she did after a course with the Columbia professor. And all these things have set the rabbit to thinking in his brier patch to find out, if possible, how much reason there is in your theories of animal psychology.

The first thought which occurs to the rabbit's philosophy is that possibly your animal psychologists are like a young hound pup that occasionally goes hunting through the brier patch and that always barks loudest when running a back trail. In a word, why should you speak at all of animal psychology, as if it were something entirely distinct from your

own human kind? So far as the rabbit can learn from listening to your wise scientists, the laws of this amazing universe seem reasonably constant. There is no animal chemistry or animal physics—that is, no science or law that applies to the beast but that changes its operation when it enters a man. If there is any unity in the force or the God that runs the brier patch, then the laws of mind are also constant. Any truth, therefore, which you discover about your own mind—which constitutes your psychology—must apply to any mind wherever you find it, whether in heaven or hell, in the brier patch or the professor's easy chair. The only question, therefore, is whether or not the animals have a mind.

Most of your scientists and biologists, from Darwin down, agree that animals have rudimentary minds, and that all which you find written large in yourselves was long ago written small in them. Indeed, all that you now have is but a development of their rudimentary powers. Now psychology, as well as chemistry, knows no large or small, no animals or men, no yesterday or to-morrow, but only the laws of mind and matter. As one of your own naturalists has pointed out, you have discovered certain laws or principles of your own inner life, and that is absolutely the only measure or knowledge you possess to lay upon the life of any creature. To speak of animal psychology, therefore, is, upon the face of it, as unmeaning or purely redundant as a vocalization as to talk about animal gravitation.

At least so it seems to the rabbit, who has seen many a man go poking along his back trail and getting farther away from him at every step. In your animal psychology you seem to be proceeding upon the assumption that law is an arbitrary and variable affair, that it changes not only its gait but all its fundamental principles when it chances to run on two legs. In a word, you are running a back trail, to Descartes and his beast machine; you will never find the rabbit until you about-face and run the other way, with the naturalists who are trying to understand the animal as he is in his own skin and in his own brier patch, and not in the stuffed specimens or in the traps and

cages in which you frighten the wits out of him before you conclude that he has no wits and does no thinking. And this leads the rabbit to the queer subject and the amazing results of animal experimentation.

Another modern college professor has been watching caged monkeys and performing a variety of experiments on chickens, dogs, cats and guinea pigs shut up in cages with wire springs and trapdoors and other such unnatural devices, and from his watching and experimentation announces positively that the animal does not think; that "transferred associations"—that is, as it were, side jumps of consciousness, as if your nervous system were made of fleas—take care of him automatically. He has no reason, no will, and therefore no more psychology than a spring gun or the twitch-ups that some of your boys set for the rabbit in his own brier patch.

Here is another back track that you are running eagerly and noisily; for all such experiments seem to miss the whole question at issue. The point is not whether animals think habitually or are governed by thought, but whether or not they are capable of thinking. Animals are not governed by thought except in unusual circumstances, and any course of experiments to prove the fact is as superfluous as the misguided efforts of a certain ornithologist who collects fifty or sixty nests, with the eggs of each species of birds, destroying thousands of lives and much beauty to show that the eggs differ slightly in size and coloring—an utterly insignificant fact, since there are no two leaves alike in the whole forest, and one which every child and rabbit knows before the atrocious collecting begins.

An elaborate system of experimentation carried out with men in the same way would only repeat the fact, which you already know, that men in the mass are generally thoughtless; that they are largely governed by habits, appetites, passions, prejudices and traditions, and that there is little individual free will among them. Some of your biologists, like Haeckel, claim that there is none at all, and some of your exceptional, thoughtful geniuses often remark that

thought is the rarest thing among men, tho they have brains organized for that purpose. If thought is rare among men it will be vastly more so among animals, whose lives are so much simpler and more elementary than your own.

Again, the rabbit ventures to suggest that the experiments themselves are of a kind to prove nothing except perhaps your professor's short-sightedness and lack of humor. Traps and cages and spring doors and experiments are so utterly foreign to the animal's daily life that to draw a rational conclusion from their actions under such circumstances has about as much value as to judge men and women in a stock panic or when they are shut up in a burning building. If the rabbit could catch a Chinaman and fasten him in a devil wagon and fix the sparker and pull the lever and send him off whizzing and then watch his actions, he would conclude, after the manner of your psychologists, that men are governed by the peculiar form of reflex action known to you as hysteria and to us rabbits as the March madness. Yet the conditions would be no more confusing to the Chinaman than are those that confront the animal when he is taken from the woods and liberty to be shut up in one of your trapdoor inventions.

Against all such experiments the rabbit ventures to put the observations of your own naturalists and scientists which point to the exactly opposite conclusion. Over against the monkey cage experiments stand the records of men like Darwin and Wallace and Garner, the latter of whom spent twenty-five years watching wild and tame monkeys; against the caged cats and guinea pigs stand innumerable records of the wild animal's intelligence made by your own naturalists; and unless these men are all hopelessly blind or immoral—unless, indeed, your own eyes deceive you in watching your own pets—then the experiments are of little value in settling the main question at issue. A thousand experiments may prove to a professor's satisfaction that his particular caged animals are governed by blind fright or blind habit; but his deduction that animals cannot think is overthrown by a single fact or a true observation that

points unmistakably to the opposite conclusion.

To the rabbit there seems to be a field open for observation which your experimenters have largely missed in their psychological delusion. There is at present, for instance, a Danish scientist who is conducting a series of experiments to establish certain facts of animal life entirely independent of their psychology. To test the observation of one of your naturalists he has confined various members of the snipe family and has broken their legs and otherwise wounded them, and has then watched them pulling out their own feathers and using them as bandages, even weaving them into a kind of mat to stop the bleeding. A barbarous kind of experiment at best, and will only prove—that the rabbit well knows—that, like men, the animals vary widely among themselves, that some think and reason in a rudimentary way, while the majority lose their heads and are helpless in the face of a new situation.

While numerous experiments of this kind—tho the rabbit hopes they will be less cruel—may add enormously to your scant knowledge of animal life, it remains true that the mental quality of animals will never be determined by experimentation. A man whom you should experiment upon to determine his peculiar mental quality or genius would be as hopelessly unnatural as a man who has a hard iron poked into the back of his neck and a gleam of white light shot into his eyes and is told to look pleasant while his picture is being taken. An animal in a cage knows nothing of experiments, but he does know that you are watching him—which he instinctively dislikes, since to be watched in the woods is to be presently pounced upon by a savage animal—and he does feel more or less keenly your own mental attitude. He becomes at once unnatural and suspicious, and so long as he remains so it is utterly impossible for you to detect his thought or his habitual mental quality. As one of your scientists has pointed out, you are trying by a kind of quantitative analysis to determine the quality of a rudimentary mind and you are absolutely foredoomed to failure.

How then shall you determine the psychology of the animal? If a poor rabbit ventured to answer the question he would say: Not by experimentation, nor by hunting, nor by caging animals, nor by examining their anatomy as your biologists do, but by going among them quietly, with peace in your heart—which we understand—and observing, without apparently watching, all that they do in a wild and unconscious state. So you will find, as some of your naturalists are now doing, many suggestive and even startling things which your scientists have overlooked. Then, by sympathetic interpretation, judge what you see by what goes on in your own head under similar circumstances; for that is the only psychology you know, and that is the only possible way you can rightly judge any living action. When you meet a man whose language you do not understand (and your language, sad to say, is more an instrument of deception than of truth) you judge his thoughts and mental quality partly by his expression, but largely by his action—precisely as the animal judges you. You are bound, absolutely bound, by your ignorance of any other mental law or psychology to judge animals in the same way.

For instance (since it was the professor's cat that started this meditation), one of your naturalists records his experiments with a certain old cat which he shut up with her litter of kittens in a cage with a trapdoor to see if, after discovering for herself the secret of the spring which let her out of the cage, she would also teach it to her kittens. She discovered the secret readily enough, being a wise old cat in her way, and used it constantly to let herself out; but instead of teaching it to her kittens she drove them away from it repeatedly until they were large enough to begin to take care of themselves in the world, when she brought them to the door and showed them the way out and never entered the cage again. And your naturalist asserts—not as a fact, but only as a strong probability in view of her actions—that perhaps the old cat preferred to keep her kittens in the cage, where they were perfectly safe from dogs and

enemies, while she foraged for herself with a mind at ease.

Again, a Colonel of Engineers in your army, a careful and observant man, writes of a cat that had a litter of four kittens in a house where there was also a vigorous and inquisitive bull terrier. The old cat would take care of herself perfectly well, and while she was present she could also take care of her family; but whenever she went away for food the terrier invariably hunted up the kittens and made trouble by his rough playing. One day she took the kittens and carried them all to a neighbor's house where there was no dog. She visited them there and fed them for several weeks, but lived meanwhile with her own mistress. When the kittens were big enough the mother led them all back to her own home and the terrier, where with claws and teeth they proved able to take care of themselves. Nor did she ever again visit the house that had given her hospitality. And the officer ventures to assert that, tho cats are unusually stupid animals, this particular cat must have had a thought in her head to care for her little ones with intelligence as well as instinct.

The rabbit ventures no opinion as to the facts of these two observations, which he has taken at random from a score or more that have found their way into his brier patch. He has never crossed the trail of these two men, but he has seen many things among animals more remarkable than they record, and so he sees no reason why he should question either their honesty or their eyesight. The point is this: That your field naturalist and your officer here are probably much nearer the truth, and are certainly more scientific in their method, when they judge an animal's thought and mental quality sympathetically by what goes on in their own heads than are the experimental psychologists who regard the rudimentary minds of the animals as under a radically different law from their own, and who, by regarding themselves as superior beings, entirely apart from the animal and the question at issue, have thrown away the only possible criterion by which they can judge the animal's action.

There is, of course, an advanced psychology of self-consciousness, by which you first reason and then analyze your own mental states in forming a judgment, and this bears the same relation to the elemental reason that the higher mathematics bears to simple addition. The principles in both the latter are precisely the same, notwithstanding the fact that every boy can add two and two, while only a rare man in a million can by the same principle calculate an eclipse. So with the animals, they sometimes reason in adapting means to an end, but whether or not they ever analyze their own mental states is another brier patch, into which the rabbit does not now care to enter. He endeavors simply to point out that the principles governing your mind and his are essentially the same and that whatever little psychology you know of yourselves must serve you in interpreting our simple actions. Those of your naturalists who accept this evident fact seem to the

rabbit to be getting nearer and nearer the truth of animal life, however much your prejudices lead you to deny their observations or conclusions. As one Darwin remarked—and he was unconsciously repeating the wisdom of the Indians—the more one lives with the animals the more he is inclined to attribute to their thought and reason, and the less to their thoughtless instinct. On the other hand, those of your psychologists and naturalists who perform experiments with caged animals to determine their mental quality seem to the rabbit to be jumping merrily along a cold, back trail and getting farther away at every jump.

There is, however, an idealistic view of the universe—with which a thoughtful rabbit has some sympathy—by which you look out into space and see, across the whole creation, the back of your own head. Perhaps your experimental psychologists hope, by running the back trail, eventually to get far enough away from the rabbit's trail to meet him face to face.

STAMFORD, CONN.

To a Grosbeak in the Garden

BY IVAN SWIFT

WHEN, through the heaviness and clamoring
throng
Of mortal ways, I hear the mellow song
Of birds—the birds seem sent to me.
If this be my insanity
As men will measure it—so let it be!

When shadows that no will can drive away
Entomb me—then no sermon blesseth day
More true and sweet than that pure note
My ear hath caught afloat
From out the garden grosbeak's fervent throat.

Thou, crimson-cappéd messenger of God,
Seem'st not to feel the thorned and bitter rod
Of life. Thy hours are joyously beguiled
In melodies so wild!
Thy faith declared is "trusting as a child."

Full knowing that thy living days are brief,
Thou grudgest even an hour for sober grief;
Thy poems are scattered free without a name.
Nor hast thou thought of fame!
Is my divine aspiring yet my blame?

The world is wide 'twixt man and world's
divine,
And hearts are dull to such a song as thine;
But *I* have heard. Sing on, from tree to tree,
As thou hast sung to me,
And more shall find the God that guideth thee!

HARBOR SPRINGS, MICH.

Greek for Scientific Students

BY FREDERICK B. LOOMIS, PH.D.

PROFESSOR OF BIOLOGY IN AMHERST COLLEGE

IN looking at the commencement program of a New England college this spring, the writer, having in mind the question of the value of Greek to the scientific student, was struck by the difference in the grade of the diplomas given the classical and scientific candidates. While from a class of 82 five received their B. A. *summa cum laude* and 14 *magna cum laude*, not a single B. Sc. of either of the grades was given. Going back over the programs of the past six years a similar discrepancy was apparent, the following being the result: There were in this time 479 graduates, 78, or 16.3 per cent., being scientific. Out of the total number 54 received B. A. diplomas, either *summa* or *magna cum laude*. Four received B. Sc. diplomas of equal grade, which represents 6.9 per cent. of the high grade degrees, or less than half of what might be expected. Inasmuch as the candidates for the scientific degree do not present any Greek, and those for the arts degree have, with very few exceptions, had more or less of this language, some inference in favor of that training may fairly be drawn. It has further been the writer's experience in teaching biology (mostly zoology) that the classical students do a better grade of work in the subject than do the scientific. All his classes are composed of a mixture of both sorts, and during the first three years the scientific students were given a half year of zoology before the classicals came in with them, the latter even with this handicap doing as good or better work. The chief difference is in the character of the work presented, the tendency being for the classicals to turn out more accurate and thorough results.

It is the writer's belief that this is due to the better training obtained by the study of a language like Greek than is possible from a modern language. There are two main reasons why the Greek is the better, the first inherent in the language, due to its greater complexity and yet exact usage; the second in the manner in which the two are taught

the French or German being taught with the literary and artistic use emphasized. The second reason may be left with the mere statement, usually agreed to (as in President Hadley's recent article in THE INDEPENDENT), that the French and German are not as thoroughly taught in the secondary schools as are the Greek and Latin. Turning to the first reason, in Greek there are for nouns, adjectives and participles 3 declensions, and in each 3 numbers, 3 genders and 5 cases, each with its ending; for verbs there are 3 voices, 5 moods, 7 tenses and 3 numbers. This complexity is considerably greater than that of the modern languages, and when a student works out Greek sentences, extracting from each word its exact meaning by focusing on it this considerable number of tests, he cannot but concentrate his thought. This taking of a word and from each modification of its ending drawing a correct conclusion is the sort of training which develops accuracy, which is the requisite of a natural science. There is so much in such a science as zoology which attracts the attention and is of popular interest that the tendency is to learn merely statements about the animals. This, however, does not train the mind or develop a scientific thinker. Both are done by taking a fact and focusing on it the wealth of other facts and principles until a logical conclusion is reached in regard to the relation and bearing of the particular feature. The weakness of the mass of the so-called scientific students is their inability to concentrate, also the tendency to be easily satisfied. Inasmuch as it is chiefly the manner in which an undertaking is gone into, the best training is the one which develops the most thoroughness and accuracy, and to the writer's mind for this the Greek, on account of its extra complexity, is superior to the simple modern languages.

The mental exercise in the ancient language is as much superior to that in the modern as swimming is superior to walking as a physical exercise.

AMHERST, MASS.

The German Dress Reform Movement

BY ELSE OPPLER-LEGBAUD

[Mrs. Else Oppler-Legbaud was born in Nürnberg, where she spent her youth, and in 1899 went to Munich to study applied arts under the direction of Maximilian Dasidowich. When the noted artist Van der Velde settled in Berlin Mrs. Oppler became his first pupil. Later she returned to Nürnberg, and under the auspices of the woman's society, "Frauenwohl," opened a school for applied arts. The principal subject taught was embroidery, and the articles made by the pupils were chiefly designed after models made by Mrs. Oppler. In 1901 Mrs. Oppler took charge of the department for reform dress in the large store of Wertheim, Berlin. At the present time she conducts a private studio. Besides her regular work Mrs. Oppler is active in fulfilling orders in the line of interior decorations, particularly for artistic furniture. For her work she has received gold and silver medals at expositions held in Leipzig and Turin.—EDITOR.]

MODERN industrial art, which for the last ten years and longer has been exercising a revolutionary influence in Germany and which emanated on the one hand from the Japanese and English, on the other hand from the French and Belgians, aimed first to remodel the furniture, carpets, embroideries, books, glasses and vases and the many thousand fancy articles in our homes. Household art has so rapidly grown in popularity that we already live in a new world. In spite of all this, strange to say, on one point we have lagged behind, and only at this late date are we endeavoring to make up for what we have neglected, all that pertains to woman's dress; men for the present are hopeless. We cannot expect them yet to give up their monstrous apparel for even the bare mention of remodeling the tiresome black swallow tails and the stiff trousers provokes laughter and tempts good and bad wits to crack ill-timed jokes.

In the world, however, where woman

holds the sway, not only has there been for years the wish for a thorough reform of female attire, but such wish has also been given practical shape, or at least the way made smooth for carrying out such reform. Naturally the question at once

arises as to the causes of dissatisfaction with the dress hitherto in vogue and the reasons for our having outgrown it; furthermore, what better form of dress we are to substitute for the traditional form. If this were simply a caprice of fashion the movement itself could not be regarded as important or revolutionary, for fashion often varies its superficialities and toys with traditional forms without necessarily revolutionizing the same. We, how-

ELSE OPPLER-LEGBAUD

ever, enter the fray armed with ethical, hygienic and esthetic arguments, as a consequence of which the up to date woman, possessing the courage of her convictions, can no longer present herself to the public gaze in the laced dress of fashion made by the Parisian ladies' tailor, even if hundreds and thousands of women still remain indifferent to such

change, and we behold every day that blind worship of fashion to which we have been accustomed since we graduated from the nursery. But we have the consolation that every good movement increases slowly, but all the more surely in the end. Even if in the course of the next four years only a small number of women give in their adhesion we can console ourselves with the fact that this percentage, small as it is, represents the intelligence of the sex, which in itself cannot but give an impetus to the new idea.

An important factor in the matter is the striking contrast between our reform dress and that hitherto worn, showing a distinction both ethical and artistic. At present the fashions in dress of German women are entirely dictated from Paris, from a country the daughters of which are accustomed to other ways of living, and who take a materially different view of life from that of their

German sisters. Until now, however, we Germans have worn the same dress, altho belonging to a distinct race, and altho the corset dress pre-eminently characterizes the French woman.

The French woman moves in quite a different world from the German, and also differs in sentiment. She is more frivolous, and love and enjoyment form the ruling factors of her life. Those very peculiar and fine shadings of difference of which in France love is capable are distinctly evidenced in the entire conception and subtle cut of dress. The very word *demi-monde* and what it stands for have very characteristically

been imported by us from France. But what, may it be asked, have such women, who in Paris dictate the fashions to the Parisian tailors, to do with us German women, or the Parisian women in general? In France the woman is still, in the majority of cases, regarded from an erotic standpoint. The husband's mistress is frankly exposed to the public gaze. Naturally she will appear beautiful and in her dress unfold her physical

charms as much as possible, even heightening the same by the use of the corset dress. How different in general is the German woman! I purposely say "how different," meaning neither much better nor much worse, for in the subject under consideration it is not a question of worth, but of differences of character and habits. The German woman is more the comrade of her husband, the sharer of his joys and sorrows, and the instructress of his children; her home is her king-

MRS. MARGARETE POCHHAMMER,
One of the Leaders in the German Dress Reform
Movement

dom and she has a perfect horror of attracting attention. And as she is more faithful, phlegmatic and more serious, she has incorporated all these qualities in her entire appearance. The light and elegant qualities peculiar to the French type, in great measure due to the Parisian corset dress, are in the case of the German woman subordinated to more substantial elements. German women for the most part are lacking in gracefulness and often fail to attain it from fear of being considered affected. These differences also hold good in every particular and to the minutest details, differences, both ethical and mental, not arti-

ficially created, but which show themselves externally in the figure.

Now I would ask, Shall one and the same cut of dress be worn by persons of two such different races? Shall we Germans, or, rather, all we thinking women, shall we *nolens volens* wear a dress originating under such very different conditions and antecedents? Are we to quietly and servilely accept the ridiculous follies imposed upon us, these purely external changes of Parisian fashions,

which do not harmonize with our inmost feelings? No; our dress must be designed on quite different principles.

In its historical development our reform idea was primarily based on hygienic considerations. Only a decade ago the opinion was widely prevalent that the workwoman, who to-day is no longer restricted to the third and fourth class, first of all stands more in need of a healthy physique than the woman of society fulfilling social obligations

Reception Gown, by Clara Möller Reception Gown, by Else Oppler Mantle, by Else Oppler

Street Gown Designed by Alfred Mohrbutter. Red Silk Blouse with Embroidered Collar and Cuffs. Blue Velvet Skirt

only, and who by reason of physical inactivity is not required to make excessive demands on her body. As a consequence more careful attention was directed to the weakness of the female body, as a result of which the injuries caused by the corset dress became more apparent than ever. A number of able physicians such as Justus Thiersch, Rudolf Stratz and others demonstrated unremittingly by pen and picture the fearful deformities of the internal organs caused by corsets. Several societies were formed in Germany at the close of the nineties whose aim it was to bring about a reform in woman's dress; pamphlets were distributed, lectures given, and finally, by the establishment of periodicals devoted to the cause, led to the formation of headquarters for systematic propaganda.

These were, however, only practical and hygienic measures, forming as it were a substantial foundation on which a beautiful edifice could be erected. At this juncture the artists began to give

good and profitable assistance. The first movement had necessarily been brought to a standstill because these so-called reform dresses fulfilled simply the demands of hygienic and practical use. Thus the reform dress movement lost many adherents and prestige owing to its ugly and clumsy creations failing to appeal to popular taste.

Thereupon artists such as Fidus, Van der Velde, Schultze-Naumburg, Mohrbutter became the champions of dress reform; the critic Pudor demanded in no doubtful terms that woman's dress should follow beautiful forms. Van der Velde called attention to the psychology

Street Dress Designed by Alfred Mohrbutter. Jacket and Skirt of Etamine; Also Blouse of Changeable Silk

of woman and laid emphasis on the irresistible impulse of woman to beautify herself, partly opposing the woman's rights party, which was pursuing practical and hygienic aims only. This may be called the second phase of the movement, in contributing to the development of which, thanks to my position as man-

ager of a studio for artistic woman's dress in one of the department stores of Berlin, I have been instrumental. My chief aim is that of all artists who wish to effect a reform—namely, to create a sensible compromise between the sentiment for reform and the taste exhibited in Paris fashions and the hygienic and practical requirements of our fair sex. Our dress shall in no respect be inferior in gracefulness and elegance to the Parisian model. This can be accomplished even if we are now in the initial stages only. To be sure the task is a difficult one, owing to our having no traditions to build upon, whereas the Parisian fashions have no new problems to solve regarding the elementary forms and need only care for change. For a long time we have been hampered in our progress through the lack of good dressmakers, able to compete with the Parisian on technical grounds, artists to act as pioneers in the propagation of the health-

ful in form and material; finally the goodwill of the public at large, ready to incite and keep their eyes open. It is unfortunate to think how erroneous the popular conception of dress reform is and how the entire movement is retarded in consequence. Many a woman has had a perfect horror of reform dress, regarding it as nothing more than a flabby, badly fitting bag made of cheap material and depriving the wearer of the very last vestige of gracefulness and elegance. Such costumes, however, I am myself as strongly opposed to as any one. In this respect a change was absolutely necessary, and the attempt to produce such changes has succeeded and will continue to succeed. Men and women formerly opposed to our reform movement are gladly learning to again appreciate the female form as nature has fashioned it and are beginning to comprehend that the natural lines of nature as evidenced in the reform dress as opposed to the deforming corsets form the very basic conditions of dress reform. To attain this happy aim, when the eye rests and feasts with unalloyed delights on the soft and yielding form of the female body and its beautiful and untrammelled mobility is our hope. If, however, the question is asked in all seriousness whether one universal cut can be found for the new reform dress the answer would be in the negative as impossible, for the very reason that the one aim of the reform is to impart to these fashions the imprint of complete individuality. However varied the type of woman, the reform dress is never allowed to fit so closely to the body, in one part at least, as French fashion requires. When a belt is worn the dress is fastened either directly under the breast or rests on the hips, in order to avoid the wide loose dress, which is neither practical nor esthetic.

This form of dress depends in general upon the use to which it is to be put, whether it is to be worn at home, as a working dress, street dress or in society only. In the dresses worn at home much freedom is allowed in respect to color and form, for not being dependent upon the opinion of strangers one's own imagination has free play. Thus, for in-

Summer Gown Designed by Rudolf and Fia Wille.
Light Gray Cloth with White Appliqué and
Silk Embroidery

stance, it may happen that a wide and flowing garment will match the colors prevailing in the room. In this respect the dress worn on social occasions is related to that worn at home. In either case it depends whether the wearer's

movements are stately, or she is of a lively temperament, hence graceful and elegant. Of course, the former will not think of choosing chiffon or similar light material, but will prefer stiffer lines. In this very particular the new

Evening Gown. Designed by Else Oppl. r. Lilac Satin, Crêpe de Chine and Wine-Red Cloth. Embroidered Front

costume will as compared with French fashion evince itself capable of great versatility and striking richness of style. In the case of the working dress, however, a more important factor with German women, the fundamental aim is to make it practical in every respect. It is well known that dresses for factory girls have long been so made as to hamper all freedom of movement, and, what is still worse, are made so full as to easily expose the wearers to getting caught in the machinery. Many attempts have been made to devise suitable dress for hospital nurses, which makes a neat and pleasing appearance and is capable of being washed and ironed. Besides these there are dresses for gardening, school children, domestics, sport and other occasions, all of which intentionally deviate from the French cut.

Hitherto a practical street dress has caused us the most difficulty. We cannot go to the extreme of promenading in bloomers, but at all events we have succeeded in introducing the dress extending to the ankles to popular favor. Dresses worn with shirtwaists meet with most favor for street wear, and they are made with all possible variations of suspenders in order to distribute the weight of the material on shoulders and hips. In Alfred Mohrbutter's costume the shirtwaist dress is made with a bodice the main weight of which is borne by the hips. Mohrbutter has also designed a street dress the skirt and jacket of which is of etamine, the blouse being of changeable silk.

A very graceful effect is attained by a dress made of a light green summer material, with sleeves and insertion of white dotted mull muslin and hat of white chiffon, with flowers and gray velvet ribbon. The summer dress designed by me of pink gauze silk and lace insertion, through which narrow silk ribbons are drawn, looks fresh and airy and is especially adapted for young girls; whereas my society dress of green crepe, with long bodice and gold pointed sleeves, is intended for elderly ladies of stately and serious mien and is calculated to set off a well-developed body to good advantage. My costume of dark lavender Lib-

erty satin, owing to the color combination, makes a very rich and elegant impression. The lower ruches are of shaded red cloth, from very dark wine color to light pink. The tablier is of dark red cloth, here and there with open work, with pink satin puffed sleeves, embroidered with a severe ornament in dark gray and Turkey blue; sleeves and waist of light pink crepe de chine. With this dress a silver ornament, inlaid with mother-of-pearl, made for the purpose, is worn, which is intended to hold in the back the ends of the bodice-like waist.

"Le verité est en marche!" one is tempted to cry out on contemplating the immense strides the new costume has made of late years. At first a loosely worn dress without corsets was in society circles regarded as shocking. When authoresses, concert singers and art students began to adopt reform dress society easily became more accustomed to it, and people became convinced of the fact that woman's dignity and grace are enhanced by the dress. The new dress grew more popular from month to month. I can well remember what a sensation was created at the Munich Residenz Theater by those who were bold enough to appear in the new dress among the brilliantly gowned throng, dressed according to French ideas and stiff-laced *à la mode*, and how these pioneers of the reform dress had to suffer from the ribald jokes of the street. To-day the reform dress is met at every turn in Germany, in society, at theaters, concerts and in the streets, and it only depends upon artists and tailoresses in imparting variations to this dress to dispel the last trace of prejudice existing in conservative and court circles and to insure the new dress a brilliant future.

Tailoresses and dressmakers who from a technical standpoint were unable to cut the reform dress at first refused to aid in introducing a reform opposed to their interests. When, however, this one or that dared, after ail, to make the dress studios sprang up like mushrooms in a night, and to-day a German town will scarcely be found without one or two sartorial artists devoting themselves solely to making the reform dress.

BERLIN, GERMANY.

Does Wall Street Speculation Pay?

BY W. R. GIVENS

[Mr. Givens was until recently one of the financial editors of the *New York Times*, where he had unusual facilities for understanding all phases of Wall Street activities.
—EDITOR.]

AFTER every collapse in Wall Street prices the question is asked time and again, "Have many people been hurt in the decline?" The question is at all times superfluous. People are being hurt in Wall Street always, and the wonder is that there is ever enough public left to enable the Wall Street manipulators to carry on the speculative game. Pondering the matter one really is forced to the conclusion that it is only too true that a fool is born every minute. One might add that the majority of these fools seem to find their way to Wall Street. They come with their money; they stay temporarily, their money permanently. When they go, sadder of heart, lighter of pocket, richer in experience, the broken ranks are filled by new recruits and the good work of the slaughter of the innocents proceeds anew.

It should not be necessary, therefore, to ask whether or no there are sufferers in a Wall Street slump. That is not the basis upon which any Wall Street investigation should be commenced. The question asked should be, not do people lose, but do they ever win in Wall Street? Frankly speaking, and on the authority of many representative brokers and bankers, truth compels the answer that the many lose, the few win. It is not a subject upon which the brokers themselves care to dilate, for it behooves them to say as little as possible about the losses of their customers, and as much as possible about their gains. Did they frankly admit that the game was an extra-hazardous one for the speculator and that tho on the surface the chances seem even, the odds nevertheless are largely against the outsider, they would be very much in the position of the salesman who decries his own goods. Customers are the bread and butter of the brokers. Without them commission and brokerage houses could not live. He would be a poor broker, at once shortsighted and foolish, who ere the net

was properly cast, or the hook properly baited, would frighten the fish—more brutally speaking, the suckers—away. He is there not to discourage would-be speculators, but to encourage them; to advise and counsel in the matter of purchases and sales, if needs be, if his advice be taken, but in any event to do business. Were he to confess what is actually the fact, that eight out of every ten current accounts in his office show losses, that eight out of every ten accounts in the past in his office have shown losses, and that in all human probability the proportion of winners and losers will be at about this same rate from now to Doomsday, unless some wise man shall discover a law of winning which will be infallible, his customers would be conspicuous by their absence. Yet these are the facts. The percentage of losers to winners in Wall Street is as 8 to 2. This, it may be added, is on the conservative side so far as the losers are concerned.

All of this is apropos of a discussion the other day in a well-known banking house on the question which has been chosen for the title of this article, "Does Wall Street Speculation Pay?" The answer will readily suggest itself from the facts set forth above—that is, so far as the customer is concerned. From the broker's standpoint the matter assumes a different aspect. It does pay him, for like death and taxes his commission of \$25 on every hundred shares of stock bought and sold, and his interest for carrying charges, must be paid. It matters not to him how the trade shall result to the customer, other than that the greater the success of the speculator or, putting it better, the longer his good luck holds, the more active the account is likely to be. But come what may, the commission and the interest charges (these latter always a trifle above the bank charges to the brokers) must be met.

Now there are many reasons why the percentage is so greatly against the

trader, tho the chances seem to be even, for the market can go only two ways: up or down. It is to be recalled that the Stock Exchange is unlike any other market in the world in that the outsider rarely buys in a declining stock market. In other markets, mercantile or the like, he usually goes where and when he can get the most for his money. On the Stock Exchange, last place of all where he should do so, he reverses his policy. He invariably waits until the sky is unclouded, until all the air is surcharged with glowing suggestions of great deals and important developments to come, until prices have mounted skyward and look not only as if they could never come down, but must forever go up—and then he buys. Here and there are exceptions: men who buy when things look dark and when prices are low. These are the bankers, many brokers themselves, and the odd two outsiders out of the ten who win. But the rule so far as the public is concerned is to buy freely, almost viciously, at the top and to sell reluctantly, oftentimes under compulsion, at the bottom.

The explanation for this public gullibility is not hard to find. On each new advance in the market it is a new public that comes in, the old having been pauperized by some one or other of the preceding declines, and this public does not learn until too late that Wall Street has a faculty of discounting good things before they happen. It is a truism, too, that hope springs eternal in the human breast. The great mass of the public who appear in the Street are essentially optimistic, eternally hopeful. They know how to buy; they know not how to sell—that is, to sell short, to sell something which they do not own and have not. Because the Street is new to them they are credulous to a degree. They are ever ready to listen to "bull" talk and to the glad tidings of a coming rise. They resent any talk or any suggestion of calamity or lower prices, and they brand as an enemy to his country and a traitor to the security market any one who so talks or suggests. Then, the market against them, comes a new phase in their character; they develop a stubbornness as amazing as it is pitiful. It is astonishing how men, readily influenced or ordi-

narily reasonable in other directions, will become obstinate to the point of folly in their market operations on the "long" side. They will listen neither to reason nor to advice, and the further the market goes against them the greater becomes their obstinacy. They should have been told before! Not having been told, they purpose to see it out. They are in the fight "if it takes all winter." It is unnecessary to say that it usually does not take that long.

Then, too, it is hard to educate the average outsider up to the proper manner of trading. The general inclination and the only too frequent disposition are to take small profits and large losses. That is to say, a new man buying 100 shares of stock thinks himself fortunate if the stock should rise three points, and, allowing for his commissions, he can clear \$275. The chances are 100 to 5 that he will take the profit and be thankful for it. On the other hand, when a stock goes against this same individual three points (allowing for commissions he is then out \$325; which illustrates the odds against him and the broker's certainty) it is next to impossible to prevail upon him to take the loss even tho the market look doubtful. Instead, he will hold on and hold on, hoping for a turn for the better, the while the stock continues to go down. Then, forsooth, he will not pocket the loss because it is too great! In the end, margins exhausted, or fear overcoming him, he sells—as often as not at the bottom. He suffers a loss it may be of \$1,000 or \$1,500 because he would not earlier lose \$325. And yet on the up side a \$300 profit is too tempting for him to resist.

It has often been discussed which would be the better fortune for the tyro in the Street, to win at the outset or to lose. My own belief, allowing for the fool-per-minute theory, is that it would matter little, for the gambling spirit will ultimately prevail. Did a man lose, the chances are that, like the poker player, he would sooner or later try to recoup himself. Did he win he would at once become possessed of the idea that, whatever others might or might not do, he at least could "beat the game." There is nothing so distressing in the financial district as the young or the old novice in

the maelstrom who, having successfully taken the first voyage or two, is blatantly and swaggeringly proclaiming to his ticker associates that he knows a thing or two and will soon be one of the chosen. Poor fool, little he reckons of the days to come, little he understands that he is playing with marked cards and loaded dice and that the game is not to the swiftest but to the last.

Of course there are exceptional times and exceptional markets in which it would appear that this general statement of few winners and many losers would not apply. Such an one was known as the McKinley bull market following Mr. McKinley's second election. Then for a time everybody was winning or seemed to be. The newspapers nightly told of this bootblack or that waiter or this chorus girl or that actress, of this motor-man or that chimney sweep who had made or was making a fortune in the Street. Many of these reports were fanciful, many of them were true. But what followed? Came the Northern Pacific panic and the erstwhile bootblacks and chorus girls were looking for positions again. This is fact, not fiction. Indeed, that is one phase of the situation that makes against success in Wall Street. It is the unexpected that happens and usually that which is unexpected is unfavorable. Remembering, then, the inclination of the public always to buy, buy, buy, it is not hard to judge of the results. War, flood, the assassination of a President, a "corner," the death of a great operator, an unfavorable pronunciamento respecting the tariffs or the railroads from Washington and, presto, the market is down five, ten, fifteen or fifty points. Whoever remembers of the general market opening up five or ten points overnight?

Beyond all this, there are other sides to the question whether Wall Street speculation pays. Even in the case of the winner it is much to be doubted if in the end in some form or other it is not

prejudicial to his best interests. For one thing, money made so easily is not unlikely to go quite as easily. For another thing, the winner is apt to get a false notion of the value of money and quite likely he will be unfitted for legitimate employment. The man who has made \$500 or \$1,000 in the market in a day, it may be, may not unlikely be ever possessed of the idea that he can make it again. Why, then, struggle and toil all week at some banking or mercantile counter for \$50 or even \$100 a week? That, at least, is the probable tendency. There are, it is true, men who are wise enough to let well enough alone when they have acquired what to them seems to be a sufficiency, but their number, alas! is pitifully small.

Still another phase: that of health. Take the biggest operators of the last ten years. Governor Flower died in the prime of life. He left his office well one evening. He died that same evening and on the day following there was a panic in the market. James R. Keene is far from a well man; indeed, he has been in bad health for years. John W. Gates, a comparatively young man, is likewise none too robust. I do not say that the speculative whirl was or is responsible for any or all of these cases. I merely cite it as a coincidence at least. But this I do know, of observation, that there is no more soul-destroying, nerve racking, heart-breaking, home-wrecking center in all America than that of the huddled, restless financial people whose bailiwick is Wall and Broad streets.

Does Wall Street speculation pay? For the broker, yes; for the customer, no, in point neither of health nor of pocket.

Some one has said that the only way to beat the horse races is to go to the track, slip the admission money under the gate and come home. It is a pity that the speculative side of Wall Street has no gate.

NEW YORK CITY.

Commodore Biddle's Failure to Enter Japan in 1846

BY EDWARD S. BURTON

[The historic expedition of Commodore Matthew C. Perry whereby, in 1854, Japan was thrown open to the commerce of the world is familiar; but that the United States Government sent a prior expedition in 1845, under Commodore Biddle, has probably been forgotten because it failed to accomplish that in which Perry succeeded. At the present time, when we are seeking to promote peace between that country and its adversary, and plenipotentiaries from both are meeting upon our shores, the following recollections of a mizzentop-man, perhaps the only survivor of that expedition of sixty years ago, are of peculiar interest.—EDITOR.]

THE United States ship "Columbus" fitted out in the spring of 1845, at Brooklyn Navy Yard, for a cruise to China, as it was reported to her men. We left Sandy Hook in June. The object was to take out Edward Everett, United States Minister to China. Our first port was Rio, where Everett became so ill that he was left behind. We were accompanied by the sloop of war "Vincennes." The "Columbus" had three tiers of guns and carried about nine hundred men.

Having doubled about the Cape of Good Hope, our next port was Angier Point, Java. Commodore James Biddle went ashore and across the island to Batavia, whence they sent a Dutch man-of-war, a steamer, to us and towed us through the Straits of Sunda to Batavia. We lay a few days there and then sailed for Macao, our first port in China. Our passage up to Macao was a long one because of the northeast monsoons, and we were put upon an allowance of water while on the passage, three pints to each man every twenty-four hours. After leaving Macao we had to take flood-tide up to Wampo. We lay there all the winter of 1845-46 and refitted ship. The Commodore went up to Canton and we saw nothing of him.

In the spring we dropped down to Hongkong and, after taking in provisions sailed for Manila and lay there a few days. Cholera broke out on the ship and we lost several men. We went back to Hongkong and from there to Amoy, where a lot of mandarins came off to see us, in whose honor we fired a

salute of one gun. After lying there a few days we went up the coast to Chusan. While there some of the officers went ashore on a hunting expedition; I was one of the boat's crew who took them. It was high tide when we went in and the boat was left in charge of a couple of men. When the officers came back in the evening the tide had gone out and the boat was nearly one-half a mile from where we had been in the morning, leaving a long, muddy beach to walk over, one foot deep with mud and water. The men had to carry the officers on their backs. One of the boys, who did not like it, stubbed his toe and fell down, throwing the officer into the mud, whereupon there was a good deal of sputtering and some hard sheet iron words passed.

From Chusan we went over to Yeddo, Japan, now known as Tokyo. We hove to in the afternoon in the mouth of Yeddo Bay. The next morning we stood down into the bay before a fair wind under easy sail. When we were passing a certain point on our port side the Japs appeared in hundreds of small boats and came alongside. They made fast to the ship and crawled through the berth-deck ports and swarmed by the hundreds. A number of them, each wearing two swords, went up on the deck, where Commodore Biddle and Captain Wyman were walking, and made a great salaam. We had a Chinaman aboard who said that he understood the Japanese language; his lingo was of no use, however, as he knew no more of it than I did. After some delay there was another Jap

Drawn by S. F. R. from Sketches by John Eastley. Lith. of Wagner & McGuigan, 116 Chestnut St., Phila.

THE U. S. Ss. COLUMBUS AND VINCENNES IN JAPAN

On the 20th of July, 1846, the U. S. Ships Columbus and Vincennes entered the Bay of Jeddo or (as the Japanese call it) Yeddo. The Ships stood well up the Bay until the Japanese, who had come on board, motioned that they must not proceed further, and the Commodore not wishing to give offence anchored abreast a village, and about three miles from the shore. As soon as the Ships anchored they were surrounded by a large number of boats, from whose warlike appearance much difficulty was not anticipated. Shortly after the sails were furled, the Commanders were politely requested to land their guns, ammunition, muskets & everything in the shape of a weapon, which request was as politely refused. The Anchorage was about 15 miles to the Sd & Ed of Yedo, which was hidden by a high point of land making out into the Bay. The Country around was beautifully green and the fields as well as could be distinguished from the ships were in fine order and to all appearance well cultivated. No person was allowed to land; and boats passing between one ship and the other were

always followed by at least four Japanese armed boats to prevent their landing; and therefore there was no good opportunity of judging as to what the real state of the country might be. The visit altogether was one of the most novel kind. The people, polite, amiable and exceedingly jealous of their customs, and adhered strictly to the long established one of not receiving the slightest remuneration for anything that they gave. The visitors were politely informed that as soon as their wants were made known they would be attended to and that done they were desired to leave and never to return again. The Ships sailed from there on the 29th, after an interesting stay of nine days' during which time hundreds of Japanese visited the Ships, and to hasten their departure, formed a line of several hundred boats to tow the vessels out to sea, and left rejoicing that they had rid themselves so easily of such a number of Barbarians.

The Ships' Anchorage in Yedo Bay was situated in 'N. L., 'E. L.

To COMMODORE JAMES BIDDLE THIS VIEW OF THE COLUMBUS & VINCENNES IN JAPAN IS RESPECT

FULLY DEDICATED BY

his obedient humble Servant,

S. F. ROSSER.

[This inscription is copied literally from the the original print without correction.—EDITOR.]

who came over the starboard gangway and said, "I speaks Hollands plenty." We had a Holland Dutchman for mainmastman and to him some of the boys sung out, "Here, Fred, here's your brother." We got the two together and they commenced to break their jaws in Dutch; so they were ordered aft and all the talk was through the Dutch language, the English being translated into Dutch, the Dutch into Japanese, and so back again.

Some years before, as I understood it,

a Dutch ship picked up some shipwrecked Japanese at sea and brought them into some port in Japan, and for that act of kindness, so we were told, the Japanese allowed the Dutch to trade twice a year at one port.

After we had stood along down the bay this Japanese Dutchman told the Commodore that he had better not go further because of the fort down below and plenty of fire. So the Commodore ordered the two ships to be hove to and anchored. It was learned, however, that

DEPARTURE OF THE U. S. Ss. COLUMBUS" and VINCENNES

FROM JEDDO BAY, JULY THE 29TH, 1846.

[The rest of the caption is identical with the preceding.]

the only fort in sight—that which appears in both the accompanying illustrations—was a fake fort of painted canvas, set wholly for scare purposes.

We lay there about nine days. During this time there was no sundown gun fired nor anything done to disturb the pleasant feeling between the Japanese and ourselves. We were ordered to treat all who came aboard in a friendly way. All these days we were surrounded by little Japanese boats day and night.

We understood that Commodore Biddle while in Batavia had received a letter from the Dutch Governor to the Emperor of Japan recommending the United States as a great nation of fine people who would like to open trade with Japan. This letter was sent ashore with some presents to the Emperor. After a day or two a communication was received by Commodore Biddle saying that they had heard of the United States being a great nation of fine people, but that it would be the same as it was in China with the English—if they gave them one port they would want more—and they did not wish to open trade; but if there was anything that we wanted in

the way of supplies we should make it known. I think we asked for beef, but they had none; they brought off chickens, wood and the finest water we had during the whole cruise.

We had some fun with the water business. They could not make a barrel with two heads at that time. In some of their largest boats they brought two or three great tubs, surrounded with buckets, all filled with water. It was a mystery to the Japs how we were going to get that water aboard. We had an old-fashioned fire engine with side-brakes. We ran the engine in between two guns and ran the suction through the scupper hole. With an elbow-pipe we screwed on to the end of the suction and from there reached the tub of water. We ran the hose down through into the water-tank below. There was a gang of men detailed to work the brakes and pump. The Japs, who stood about, could see the water leaving the tub, but could not see where it went. When the water got so low that the engine sucked air they were so scared at the noise that they thought the devil was after them and jumped overboard.

A fellow came off with a present for the Commodore and he would not accept it, because the Emperor would not accept his. The man did not know what to do and moved about the ship almost half a day trying to get some one to take the present. At last he got a chance, when no one saw him, to throw it up on the stern-gallery, and put ashore for all he was worth.

The Jap who talked Holland proved to be quite a high official; he came off in a large junk and anchored near the ship. One day he invited the Commodore to call aboard. The Commodore had his barge lowered and manned and pulled alongside the junk, but as he stepped on the deck one of the Japanese guards pushed him back. The high official was in his cabin. When the Commodore found that he could not get aboard he returned to the ship. When he came over the side he was the hottest little old man I ever saw. He stamped into his cabin in great rage, and I thought at one time he was going to open up the batteries on them. It seems that the Japanese official heard a noise on deck and went up to see what the matter was, and he found the Commodore going aboard his own ship. The Jap got into his boat and hustled aboard the "Columbus" as fast as he could. He went on deck and it was some time before the Commodore would admit him into his cabin. When he did, I suppose he apologized. He had doubtless neglected to notify his guard of the expected company. The Commodore had gone aboard in full uniform with side arms. The little dried up old fellow could not make much of a show anyway, even if he were all gold lace.

After a few days the Japs began to get uneasy and wanted us to get out. They made motions for us to go. So one morning they hooked on to the cable and were going to tow us out, anchor and all, but they could not take in the slack of the chain. Next morning all hands were called to up-anchor and make sail. The signal was given to the Japs to hook on to the two or three tow-lines, and hundreds of boats did so. For an hour or two we had fair wind, very light, enough to give steerage-way with their help. About nine o'clock the sea breeze set in good and strong. We braced up yards and

caught the wind as she came down and stood over close-hauled on the starboard tack to cross the bay. Before the Japs could cast off from the tow-lines the ship got under good headway and we had them towing astern, head over heels. Many were dumped into the water, but they swam like ducks. They followed us over on that tack, but could not keep up with us, and when we tacked for the other side they followed us on that course, all the time watching that we should not land. We were pretty much all day beating up out of the bay and the Japs after us. We passed out of the bay in the afternoon, at about three or four o'clock, and bade good-by to Japan.

With reference to the impressions received from personal observation of the Japanese it is but natural that the passing of nearly sixty years since this naval expedition was undertaken should have obliterated them somewhat from my mind. Moreover, when we were surrounded day and night by hundreds of armed vessels, making sure that not a man of us touched foot on shore, it is apparent that my opportunities for observation were limited. But I saw several hundred who came off from the land in boats and came aboard the ship. They were guarding the ship and, of course, were all men. Those who came on deck were fine looking fellows, of fine physique and athletic, intelligent in facial expression and apparently very competent in all matters with which they were intrusted. On an average they were far superior to the Chinese, Javanese, Filipinos, Malays and other Orientals with whom we came in contact. They appeared very friendly and, while we lay at anchor in Yeddo Harbor, tho they betrayed nervous anxiety to hasten our departure, inclined to be sociable with us as far as this was possible among men who had no understanding of each other's language. It is easy to remember them as the superior people among all that we encountered in our prolonged cruise in that part of the world. As for their costumes, they were essentially the same as those of the present day, which same can be said of the Chinese. The Japanese paper lantern was an institution then as now, and at night it was a gay and charming sight,

with hundreds of these suspended from the boats that unceasingly watched us in Yeddo Bay.

We did not know where we were going next, but after a long passage we ran into Honolulu. We lay there about a week and then started, as we understood, for home. After about eighty days we made Valparaiso. Just ahead of us went in the United States frigate "Independence" from around the Horn, bound for California. She had orders for us to go up to California and blockade because of the Mexican War. We fetched up in Monterey in March, 1847. One day there came in a topsail schooner under English colors, running past us and anchoring near a jetty. A boat was sent over under command of a midshipman, who returned and reported all right. But something looked suspicious and another boat was manned and sent under command of a lieutenant. They pretended to be loaded with sugar and cocoa, hailing from Manila. There was something wrong with the papers of the ship, and the lieutenant sent the crew aloft and unbent the sails and put the captain and mates in irons. When he

came to break out the cargo of sugar and cocoa he found arms and powder underneath. Our purser bought in the cargo of sugar and cocoa; the guns and powder were sent ashore. Afterward the ship was sold at auction and bought in by the same owners.

We lay at Monterey till about the first of May, then sailed for San Francisco and anchored off Saucilito. After a week or two we hauled over opposite San Francisco. But there was no city then. General Harney was camped on the side hill where San Francisco now stands, with soldiers and mounted men, there being not a house there.

In July we made sail for home, making passage back to Valparaiso and having a fair run around Cape Horn down to Rio, and coming from there to Hampton Roads and Norfolk Navy Yard. The "Columbus" was stripped and lay at Norfolk until the Navy Yard was burned at the commencement of the Civil War, when she went up in flame with the "Delaware," "Pennsylvania" and other ships, burned by our Government to prevent their falling into the hands of the Confederate Government.

NEWARK, N. J.

The Pine Trees on the Beach at Maiko

BY MADAME SHIMODA UTAKO

TRANSLATED BY ARTHUR LLOYD.

[The authoress of this poem is one of the most prominent educationists in Japan, and, as head of the Peeresses' College, exercises a wide influence over the ladies of Japan. She is well known also as a writer of poetry. The poem which I have here translated, preserving the original meter, was written some years ago, when the authoress, during a visit to Maiko, not far from Kobe, saw the pine trees along the road, which here skirts the beach, cut down by the workmen who were then constructing the railway that connects Kobe and Hiroshima. The original Japanese poem is very short, the words in italics at the end being, in fact, a translation of the whole. The poem is, however, unintelligible without a knowledge of the facts upon which it was based, and I have consequently been obliged to adapt it for the unimaginative Western reader. —A. L.]

ON Maiko's beach I wandered, and beheld
The prostrate pine trees, where the wood-
man's ax,

Preparing for the iron road, had wrought
Destruction. Side by side the giants lay,
Silent in death; no murmuring rustle stirred
Their limbs and severed branches.

"Here," me thought,
"The picture of a noble hero's death—
Content to stand as guardians of the road

When the road needed them, content to fall
To serve a higher purpose.

So I mused
And, musing, shaped my ponderings into song:

*"Those who, in their youth,
Follow Virtue's teachings high,
And the paths of Truth,
When life's glooming eve is nigh
Meet their doom without a sigh."*

THE RUSSIAN ENVOYS AT PORTSMOUTH

Chauffeur

Secret Service Man

Mr. Witte

Baron Rosen

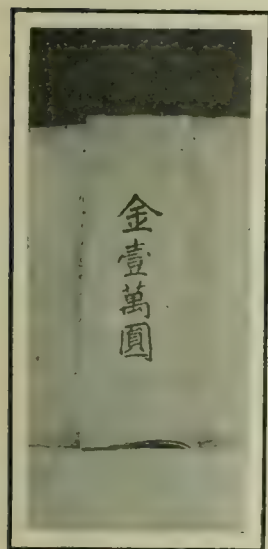

Dalny

BY J. H. DE FOREST, D.D.

[This is the third article drawn from Dr. De Forest's trip to Manchuria. His observations on the character of the Japanese soldier which leads him to be fearless of death, while incidental, are nevertheless striking. We give below *fac-similes* of the letters written by the Emperor and Empress of Japan in commendation of the work done during the war by the Young Men's Christian Association, in which Mr. De Forest is now engaged.—EDITOR.]

Envelope Containing Imperial Letter and Check for 10,000 Yen

streets of deep dust or deeper mud, flanked by dingy Chinese shops and laborers' hovels. On one side of this double town is the large harbor that makes Dalny important to the East. I used to wonder why Russians should build a new city twenty-five miles from Port Arthur when they had there a harbor and the beginnings of a city. Apart from military reasons Port Arthur is too small. Dalny's harbor is at least fifty times as large, and a small section of one of those massive piers placed across the mouth of Port Arthur would bottle up that little harbor more effectually than did the twenty-seven ships that Togo drove into its entrance.

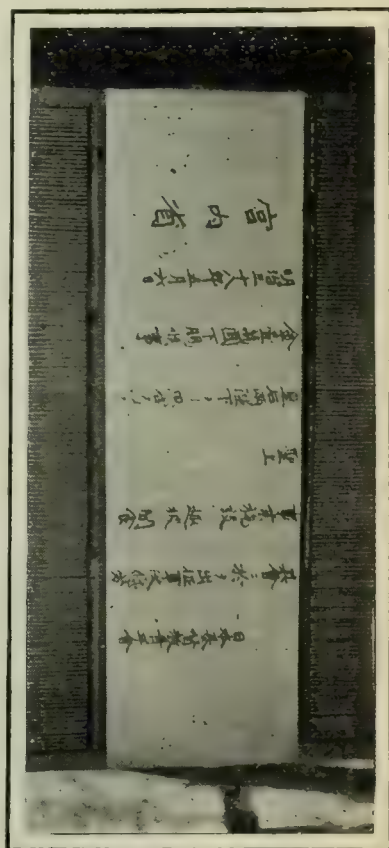

On the other side of the town lies a high plateau, where are the beginnings of a park, with fine roads passing the permanent barracks toward the southern

This "flat city" that boasts the highest brick chimney in all the East, that was built at immense cost of Russian roubles, has broad macadamized streets and cement sidewalks lined with artistic fences of brick and stone, behind which are houses of the same material, each with an architectural beauty of its own. A deep, broad railroad cut sharply separates this Russian part of Dalny from the larger Chinese settlement, where are

hills. In this city are no trees, nor are there any on the plateau and hills beyond. Even the artificial beauty of the Russian offices and residences is sadly marred by blackened and roofless houses, including the spacious city hall, that were looted and burned when the Russians hurriedly evacuated the place.

As our steamer, on which was a regiment of soldiers, entered the harbor we were signaled to cross the bay and land at Ryujuton, six miles distant. Apparently the docks were congested with steamers, some of which were unloading provisions for the army, while others were loading up with thousands of sick and wounded Japanese from the recent Mukden battles, and others yet were being filled with thousands of Russian prisoners bound for Japan.

A Govern-

The Imperial Letter: "To the Young Men's Christian Association in Japan. In view of the sympathetic work done by this association among the soldiers, their Imperial Majesties the Emperor and Empress bestow the gift of 10,000 yen.—38th Meiji (6th of May), The Imperial Household."

A Palace of Dalny Built in Honor of the Czar.
The Cathedral Tower is at the Left

ment launch brought us back to the dock, and one glance at the near streets showed that the town was as congested as the harbor. I saw hundreds of disarmed Russians sitting quietly in the abounding dirt of the streets and guarded by an occasional Japanese soldier. The large buildings that had been converted into hospitals were overflowing with the sick and wounded of both sides, and the fine residences, together with the cathedral, were requisitioned for the same use. "Be ready for 10,000 wounded," was the order for Dalny alone before the Mukden battle began. And that figure wouldn't begin to cover the army of unfortunates that steadily poured down from the north in several train loads a day for weeks. Every time I went to the temporary station during the last week in March the ground all around was either covered with wounded or else the Chinese coolies were there with stretchers awaiting the next train. Later on, as I gradually went north, every few hours we passed a long train loaded with the victims of the war. The very length of the trains was suggestive of the horrors of those fifteen days of battle. I often counted over fifty cars, and the worst of it was that they were mainly platform cars open to the cutting winds and cold of early Manchurian spring. It was a tortuous ride of thirty hours on springless trucks.

Such was the traffic coming down the Eastern China road into Dalny. What went up from Dalny was very different. You might well think it was troops, for they were landing by thousands every day, but not a train of soldiers rode north while I was in Manchuria, and I doubt whether one has gone since. For it exhausts the carrying capacity of the line to take only the absolutely necessary provisions and ammunition for the half million and more soldiers on the battle line above Mukden. There is a third-class passenger car attached to one train a day for swell passengers, such as foreign military attachés and a few Japanese officers. On other trains there was nothing better than a box freight car, and sometimes not even that.

No, the soldiers all have to tramp north, at the rate of fifteen miles a day, with their sixty pounds of fighting apparatus. Day after day I saw whole regiments on either side of the railroad tramping through the fluffy, powdery dust of the plains toward the battlefield. Dalny Harbor is the only good place where Japan could land her troops and provisions so long as the harbors of Niuchwang on the west and Antung on the east were icebound. What a pressure was on Dalny and the railroad there may be inferred from the fact that on March 31st, when the ice broke out of the Liao River, I saw forty-five steamers crowding into the river mouth at Niuchwang and Newkaton.

Dalny in the hands of the Japanese was what made possible every victory from Port Arthur to Mukden. Those huge siege guns that sent destruction into the forts around Port Arthur and pounded to death the Russian battleships cooped up in that harbor were landed at Dalny. Kuroki's army, of course, never could have brought sorrow to Kuropatkin at Liaoyang but for the help of Oku's army that was provisioned from Dalny. Nogi's army vanished as soon as Port Arthur fell, and when next heard from by the outside world and Kuropatkin, too, he was far north of Mukden, having made that splendid flanking movement which resulted in the collapse of the right wing of the Russians, and so insured that crushing defeat of Kuropatkin's entire army. Yet Nogi could not

have done it but for Dalny as his base.

This was the one great impression Dalny made on me as a military base. When I first entered the Chinese part of the town it seemed as tho I must be in Egypt in the midst of hundreds of pyramids. But instead of containing mummies these pyramids were the very life of the army, being composed of bags of rice, wheat, charcoal, clothing, shoes, ammunition and boxes of all descriptions. Even the kindling wood necessary for the troops had to be brought from Japan.

Now, Japan is one of the wet lands of the earth, with an occasional dry spell thrown in, but Manchuria is just the opposite—a dry land for six months, with no danger of even a real shower. On the cemented streets of Russian Dalny there could be no great accumulation of dust even if it never rained, but in Chinese Dalny the powdery dust was three inches deep, and when the wind blew this became three hundred feet deep, making life miserable for man and beast. But there was no danger of damage from the climate to these army stores piled up in pyramids fifty feet high. Enormously long freight trains were carrying these pyramids north day and night. I heard it said that even tho the Baltic fleet should sink Togo's ships and cut Manchuria completely off from Japan there were provisions enough to last the army a year.

Dalny was interesting not only as a base of supply, but it was delightful on account of the persons I met there and the exceptional privilege granted me of addressing large bodies of soldiers. Among the persons, first of all was the Military Administrator of Liaoyang Peninsula, General K. Nishi. I had occasionally met him during the years he was in command of the garrison at Sendai, but I was astonished at the cordial welcome this busy man gave me. At one of his dinners he introduced me to two Buddhist priests, one of whom was the younger brother of Count Otani, head of the famous Hongwanji temple at Kyoto. At another dinner, given in honor of Lieutenant-General Burnett of the English army, there were three generals from the Sendai Division—a very pleasant event for me. Concerning the cordial welcome I received from the officers and

men of the army not only in Dalny, but everywhere I went, General Burnett's words express my mind: "In all my life I have never experienced such kindness and hospitality as I have received since I became a guest of the Japanese army."

The three evenings spent with these gentlemanly warriors gave me a new insight into the virtues of the common soldiers as well as of the officers. Major-General Kamio, Chief of Staff, had fought through the entire siege of Port Arthur, and he said that what impressed him most was that the farmer soldiers, whose ancestors were not military men, had caught so perfectly the samurai spirit and were absolutely fearless of death. They would go to the trenches, or at the wire entanglements, or in a bayonet charge, with a smile, tho certain one-half of them would never come back. Never a coward among them! At the close of the Chinese War a Chinese said to General Kamio: "We were badly put to it because your men are fearless of death, while ours run away." He replied, and I have heard similar words many times since this war broke out: "Our men don't like to die. They do not go carelessly to death. But there are things they prize more than life, and death in

The Dalny Cathedral, Turned Into a Red Cross Hospital for Japanese Officers

A Train of Severely Wounded Japanese in Box Cars. Chinese Coolies Waiting to Carry Them to the Hospital on Stretchers

the pursuit of these is nothing." Major-General Okazaka spoke in similar terms with real admiration of the soldiers who had fought under him not only in that desperate and repeated attempt of the Russians to recapture the Maten Pass, but clear through the hundred and fifty miles from the Yalu River to Liaoyang. He said that if he were to single out one from many impressive facts it would be the joy of the soldiers in the battle line and even in death. "I've seen them torn and dying with ghastly wounds, yet smiling and saying with their last breath, 'Heika! Banzai!'" This was a common experience and it was profoundly affecting." On being asked what were the especial delights of a soldier's life he shot out this quick reply with a hearty laugh: "Seeing the enemy run and running after him."

Here I had my first acquaintance with the interpreters of the army and learned another secret of Japan's success. Foreign military attachés and war correspondents from all over the world, speaking pretty much every language except Japanese, are within the army lines and must be cared for by interpreters. Besides this, the battles are fought in a country where only Chinese is spoken, and the tens of thousands of common prisoners taken use only Russian. Interpreters are a necessity, and since the world sees the Japanese army mainly through them their position is one of great responsibility. I found them without exception splendidly equipped fellows, many of whom had studied at the great universities of Europe and America. Lieutenant Koderu was the first one into whose hands I fell, and as he

had studied political science at Yale and in Berlin it was a daily pleasure and profit to spend whole hours with him.

Besides the social meetings with the men who had done things, my Dalny visit was memorable for the public meetings held with a thousand or more soldiers. When the war broke out there were numerous requests on the part of the Christians to be allowed to accompany the army as chaplains. It was known that every division could take three chaplains, and it was hoped that one or two Christians would be permitted to go, even tho the number of Christians in the army is comparatively small. But every place was given to Buddhists, and even when Shintoists were permitted to go it was under another name than chaplain. I said to a Major who had come to bid me farewell: "Of course, we foreign missionaries have nothing to say, but you army men have always invited Buddhists to address the soldiers and have never yet asked a Christian. It seems to me that you are not fair in persistently keeping out of the camp Christian speakers who are thoroughly capable

of interesting and benefiting the soldiers." To which he replied: "Wait till this war is over and you shall have your chance."

I had never dreamed that this opportunity would come to me and on Manchurian soil, too. But when invited by the Young Men's Christian Association to visit their work in the field, both of their Excellencies the Minister of War and the Prime Minister gave me warm letters of introduction as a Christian missionary of thirty years' standing and asked that proper facilities for accomplishing the purpose of my visit should be granted me all through Manchuria and Korea. So a new thing happened at Dalny. The Chinese theater was twice well filled with officers and soldiers to hear a missionary speak.

Now, I think there never was an army whose officers were more sincerely desirous than those of this army that their soldiers should be kept from temptations and braced with earnest moral purpose. It was because the Young Men's Christian Association in Tokyo had attracted the attention and co-operation of many

A Train of Fifty Cars with Provisions and Ammunition Going from Dalny to Mukden under Guard

A Mile of Pyramids of Provisions and Ammunition Was One of the Impressive Scenes of Dalny

leading men that at last the moral-loving military authorities permitted the experiment of Christian work among soldiers. I found in Dalny three Japanese workers in a building provided by General Nishi, who spoke kindly of the work that was being done. Here the soldiers could meet and play games, read magazines, cut each other's hair with Young Men's Christian Association clippers, listen to gramophones in either English or Japanese, write letters, and all at no expense, while there were daily Bible readings, followed by earnest and bright sermons.

To find Christian workers welcomed among Japanese soldiers in a city under martial laws made Dalny seem more than a promising terminus for the Siberian Railway, more than a mere base of supplies for a huge army, and more than a rival port to Niuchwang. The military authorities there must have spoken very emphatically of the Young Men's Christian Association work or surely there

would have been no Imperial gift of 10,000 yen for this Christian work—a gift so significant and unprecedented that a war correspondent deemed it worthy of a special cable to the papers of America.

It may sound strange, but Dalny seemed to me to have a serious, almost religious, atmosphere. It was manifest to others, too. When I asked General Burnett how he, a soldier, accounted for such a series of unparalleled victories he replied: "You have asked a straight question and I'll give you a soldier's straight reply. I'm not much on religion, but I verily believe that God Almighty had a great work to do here in the East, and so He raised up Japan to help Him do it." General Kamio was similarly serious in what he said: "The samurai cares little for religion (meaning, I suppose, religious ceremonies), but nevertheless all his mental, moral and spiritual powers come from heaven."

Dalny lingers in my mind as a rare and delightful experience.

MIKKO, JAPAN.

Sergius de Witte and the Bankruptcy of Russia

BY DR. ISIDORE SINGER.

Dr. Singer is one of those cosmopolitan scholars, intimately acquainted with European conditions, whom the love of liberty has sent into happy exile. His present labor is that of editor of the "Jewish Encyclopedia," now approaching completion.—EDITOR.]

NOW that both delegations have started to discuss one by one the twelve items of the proposed treaty of peace, and representatives of two of the foremost American banking houses have been in Portsmouth to be consulted on the question of the war indemnity, an impartial survey of the Russian exchequer at the outbreak of the war may be of special interest.

The fact that the former railroad clerk and German *roturier* Sergius de Witte has ousted at last as senior plenipotentiary of the Czar the old, experienced diplomatist Count Nelidoff and the former Minister of Justice and Foreign Affairs, Mouravieff, both belonging to the Russian court aristocracy and bureaucracy, is in the minds of those who looked somewhat closer into Russian affairs sufficient proof for the surmise that the payment of an indemnity and the means how to raise it will be the principal topic of the Portsmouth conference and the main concern of the Russian Embassy. No living Russian statesman is indeed fitter to take care of this momentous problem than the greatest financial sorcerer of modern Russia, Sergius de Witte. The latter is not only a financial genius, but also a great statesman, who, in spite of—or perhaps *because of*—his foreign descent, has gauged the psychology of the Russian nation as none before him. He knows best the burden which may be imposed upon the mujik without spurring him to open revolt, and he has also backbone enough to set a limit to the greed of the grand ducal clique.

Fully to understand the game of this financial Cagliostro, who played with billions of rubles as if he had the combined riches of the United States and Great Britain to draw upon, a few facts culled from the financial history of Russia may be adduced in the way of introduction.

In 1734 the State budget of the whole Russian Empire, already then stretching from Riga on the Baltic to the shores of the Pacific, was 181,000 rubles (\$91,000) in hard cash. The employment of money as mode of payment on a larger scale only dates since the emancipation by Alexander II of his 5 millions of serfs in 1861, 95 per cent. of the population up to that time living from the produce of the soil or from house industry. Alexander's generous act and the Turkish war of 1877 revolutionized the Russian exchequer. The entire gold reserve, in spite of the output of the Siberian gold mines, in 1887 was 281 millions, just enough to pay the interest of Russia's foreign debt. In that year de Witte's predecessor, Wishnegradsky, the son of a humble priest and himself the creator of Russia's modern financial system, was appointed Secretary of the Treasury with the set purpose to grapple with a national debt of four and one half billion rubles, eating up an annual interest of 262 millions. And he apparently succeeded in carrying out his program, for during his term, 1887-1893, the gold reserve rose from 281 to 782 millions, an annual surplus of 41½ million rubles was established and he was enabled to pay the foreign debt without straining the national finances.

This was the state of things when the present senior plenipotentiary of the Czar, or, rather, of the Dowager Empress—who seems to be a worthy counterfeit of her Chinese colleague—sat down at his desk in the Russian Treasury Department. He found a national debt of 4,571 millions (interest, 241½ millions), which he was, in spite of the wise warning of one of his predecessors, Count Cancvin (1823-1844), "to fall back on foreign loans only in cases of the most urgent need," bound to increase, first, on account

of the aggressive and expansive policy of his country in Asia, and, secondly, because of the lack of mobile Russian capital. Witte recognized the absolute necessity of developing his country industrially, but, in true Russian fashion, he wished to obtain in one lustrum what other countries attained through the strenuous labor of decades.

The motives of Witte's haste are easily intelligible, if from no other, from the merely personal standpoint. Having, as we already know, no powerful connections at the court, he could reach the uppermost step of the *tchin* (bureaucracy) and keep himself there but by the development of phenomenal skill, energy and, if needs be, bluff, one of the main assets of Russian statesmanship. Witte had, moreover, to fight the opposition of his colleagues of the Council of Ministers to his financial and agrarian reforms. He plunged, therefore, headlong into a series of revolutionary innovations: the currency question was regulated by him by purchase and sale of gold drafts (his gold reserve in 1893 was 581½ millions), the taxes were increased by 70 millions yearly, the tariff war with Germany was ended by a commercial treaty, one foreign loan after the other was placed, etc. Little by little he became the absolute master of the entire financial machinery of Russia; State and private banks received orders from him.

In 1896, when his gold reserve amounted to 630 millions, but with a balance of trade in Russia's favor of less than 100,000,000, he deemed the time ripe for the introduction of the gold standard, a risky adventure with a country with a retrograde population, industry in its infancy and no money circulation worth while being taken into consideration. To diminish the outflow of gold in payment of railroad and agricultural machinery he set out to create a gigantic native industry which would at the same time occupy the peasant during the long Russian winter and enrich the factory owners. But here the vicious circle in which he found himself became clear to him for the first time; in order to attain his purpose he had to borrow enormous sums in foreign markets, cleverly profiting by the alliance of his impoverished country with *belle et riche* France. How many billions of francs

has left the French stockings to buy thousands of harvest machines which now lie rusting in the backyards of the lazy nobleman and peasant, to fortify Port Arthur and Vladivostok, to build the trans-Siberian Railroad, to bribe the court officials of the Emperors of China and Korea, of the Shah of Persia and the Emir of Afghanistan, is impossible exactly to tell, since no reliable data exist. But generally reliable authorities place the totality of French loans from 1893 to 1904 at about \$1,700,000,000.

Von Schierbrand distinctly accuses de Witte of ingenuity (not to use a harsher term) in his financial transactions, for the Russian financial wizard confessed in his own official reports that he cared little what ultimately would become of the money borrowed from the beautiful and economical lady on the Seine. The writer of these lines lived in Paris when the Franco-Russian alliance was sealed by the enthusiastic national reception of a delegation of Russian sailors from some of the warships now populating the bottom of the Sea of Japan and can yet distinctly remember how men like the present Premier Rouvier and Senator George Clémenceau were suspected of lack of patriotism because they guessed merely financial motives were back of the wooing of the northern bear. And I surmise that Sergius de Witte before sailing for the United States must have passed more than one *mauvais quart d'heure* at the Quai d'Orsay in answering some questions of friend Rouvier, the Colbert of the Third Republic.

Great, indeed, is the probability that Russia never will pay back her debts to her ally, who has not even the chance of seizing some transoceanic possession of hers now that Port Arthur, Dalny and Sakhalin are and Vladivostok will presently be in the hands of Japan.

In short, in 1903 the foreign debt of Russia had grown to 6,150 millions (interest, 292 millions). But the gold reserve rose all the time, reaching by January 1st, 1899, a surplus of 1,600 millions. Witte's fame rose to gigantic heights; the naïve *mujik* believed him to be an alchemist. And he even imposed through his skillful manipulations and diplomatic financial reports upon big, cool-headed bankers in Western Europe, who forgot that this apparently immense

gold surplus consisted in reality of new debts and that in order to pay the latter's interest it must leave the country as swiftly as it came in.

To extricate himself from his embarrassing position Witte converted, to the amazement of financiers, a billion of Government bonds held in Russia itself, redeeming the 5 per cent. by 4 per cent., withdrawing with the latter not only the first, but also the 4 per cent. gold bonds, selling them all in foreign money markets. The capital thus liberated was turned toward industrial enterprises promising higher returns, and soon the same industrial fever reigned in Moscow, St. Petersburg and Odessa as in Berlin, New York and Chicago. Between 1894 and 1899 927 stock companies were organized, with a nominal capital of 1,420 millions, the actual being estimated at 560 to 600 millions. The whole railroad system of Russia passed under the control of the Government, Witte expending in 1893-1902 2,250 millions in enlarging its State network. By 1897 some 4 billions, nearly all foreign capital, had been invested in State and private railroads, which, on January 1st, 1902, according to the report of Prince Hilkoﬀ, the Minister of Railroads, had attained a length of about 42,000 miles (against 221,000 in the United States, less than half the size of Russia). There was and is, however, no prospect, as far as eye can see, for Russia's railroads to pay within a decade or two, far more than half of the railroad system running through territory more sparsely settled than the Western parts of the United States. These facts were, alas! not known by the thousands of small investors in France, Germany, Belgium, Holland and also in this country. The naked truth is, to use the words of Wolf von Schierbrand, that Sergius de Witte has during his ten years' administration been "bamboozling" the dear public in both hemispheres, holding out as a brilliant bait the alleged "enormous productivity" of Russia.

To sum up: France's purse-strings were drawn tighter with the beginning of the twentieth century; in 1901 a miserable little loan of 181 millions which Witte tried to raise in France had to be

placed in Germany and Holland, whose bankers, not satisfied with the mere guaranty of the Russian Government, asked as security Russia's share of the war indemnity due from China on account of the Boxer rising. A few days after the outbreak of the Japanese war he met with the same difficulties in raising a war loan of 100,000,000 rubles, which shows clearly that Russia's borrowing powers with the Western nations are on the wane. Eighteen months of an unfortunate war have passed, during which the Russian navy has been annihilated, the hundreds of millions of rubles which was spent for its construction and equipment having become a mere waste; the equipping of an army of 600,000 soldiers swallowed other untold millions. As a natural consequence of the war and the revolutionary perturbances commerce and industry were lamed and the credit of the country was bound to reach the freezing point.

These were the conditions under which Emperor William II and Nicholas II met a few weeks ago off the coast of Finland—forsooth, not to change the map of the world, but to put up another big bluff, since the smaller one which was let loose by Witte before leaving St. Petersburg for Paris had lamentably failed. Willie and Nickie—as the two cousins call themselves when they are *en famille*—will have laughed at the serious editorials the newspapers of both hemispheres have devoted to their excursion and the perturbation they created in the various foreign offices. William II, who was persuaded by King Oscar II not to extend his protecting mentorship to the dynasty of Bernadotte, turned toward the frail and perhaps the last imperial scion of the Romanoffs in order to occupy for another week the center of the world scene. May the American public rest assured that a two hours' after dinner talk at Oyster Bay between Roosevelt and Komura-Takahira will weigh more in the decisions of the Portsmouth conference than the mysterious and solemn conversations in the luxurious state cabins of the "Polar Star" and the "Hohenzollern" between their Majesties Emperor William II and Nicholas II.

NEW YORK CITY.

Literature

New Books on Russia

IN these days of foreign war and internal disorder Russia has become the cynosure of all the world. Not since the great French Revolution has the situation of any European nation been so desperate, so complicated and beset with difficulties, so fraught with possibilities

lace's *Russia*,¹ which has occupied for almost a generation past the foremost place in the literature of the English language on that country. But when it first appeared, in 1877, there was no widespread revolutionary movement, nor was there an extensive modern industry based on the factory system, nor was there a large working class concentrated in the cities.

Paul Milyoukov

Prof. Paul Milyoukov, Author of "Russia and Its Crisis." University of Chicago Press.

for weal or for wo, so menacing to its own existence and to the peace of mankind. Under these circumstances any publication that adds to the world's stock of knowledge concerning the past and present of that vast country is assured of a hearty welcome.

First in importance among these new publications is a new edition of Wal-

The chief interest of the new edition centers, therefore, in the five new chapters, which treat of these novel features of Russian life with the same caution and catholicity of spirit, the same breadth of view, the same willingness and ability to comprehend a situation from its various

¹ RUSSIA. By Sir Donald MacKenzie Wallace. Entirely new and much enlarged edition. New York: Henry Holt & Co. \$5.00.

aspects that characterize the entire work. One after another are marshaled before us the successive phases of the revolutionary movement—the rise of the Liberal *fronde*, the early academic Nihilism, the period of propaganda and “going among the people,” the attempts at raising peasant insurrections, terrorism and its decline, the rise of Social Democracy and the recrudescence of terrorism, down to “bloody Sunday” (January 22d, 1905). Nor is the new material confined to the added chapters, but the account has been recast and brought up to date wherever it seemed necessary. Thus the chapter on territorial expansion and foreign policy gives an excellent account of the events leading up to the present war, the chapter on the emancipated peasantry attempts to arrive at some definite conclusions concerning the present position and future prospects of the most numerous and least known of the social classes in Russia, and so forth, throughout the work. The author is now at Portsmouth as representative of the *London Times* at the Peace Conference.

In July, 1904,² a political trial took place at Königsberg, Prussia, in which German subjects were prosecuted for smuggling Russian revolutionary literature over the Russian frontier. The trial was followed by the expulsion of certain Russian students then resident in Germany. To an interpellation made in the Reichstag Count von Bülow, the Imperial Chancellor, replied in terms of contemptuous irony for the heroic struggle for liberty in Russia, referred to the exiled Russian students as “beggarly rascals and conspirators,” and cited precedents to prove that the subservience of the German to the Russian Government was no new departure, but a firmly fixed policy of long duration. One of the cases cited by the noble lord was that of Leo Deutsch, the author of the book before us.²

Leo Deutsch joined the “propagandist” movement in 1874, as a youth of nineteen. Shortly thereafter he was involved in an attempt to kill a fellow revolutionist who had turned traitor and informer. A number of arrests followed,

but Deutsch escaped capture and took part in an attempt to organize a peasant insurrection in the Tchigirin district of the province of Kiev. Deutsch was arrested and imprisoned in Kiev, but in the beginning of 1878 he made his escape with two comrades. In 1880 he left Russia and settled in Switzerland, where he, together with Plekhanov, Axelrod and Vera Zassulitch, formed an organization that became the nucleus of the present Social Democratic Party of Russia. In 1884, while engaged in transporting revolutionary literature from Switzerland over the German border for further shipment to Russia, he was arrested by the German authorities and delivered over to the tender mercies of the Russian Government.

After his experiences with the rigid discipline of the German prisons Deutsch's heart must have warmed up at the fraternal way in which he was received by the Russian gendarmes.

“‘Good morning, Deutsch! Good morning, sir! Here you are at last! We have been expecting you for ever so long,’ were their greetings. I saw round me the fresh, smiling faces of young Russian peasant lads surmounting the hated dark blue uniform. Their free, familiar bearing made me smile back at them as if old friends were welcoming me.

“‘How do you know me?’ I asked them, as we went toward the gendarmes' quarters.

“‘Oh, of course we know you; we've heard such a lot about you!’ cried several. ‘Will you come and have some tea at once, or brush the dust off first?’ they asked, and vied with each other in doing the agreeable and making me feel at home.”

Deutsch then narrates his experiences in various Russian prisons and in Siberia until 1901, when he effected his escape across Japan. The book is, however, much more than a record of personal experiences, for it contains numerous sketches of political prisoners as well as descriptions of the life of ordinary convicts. And all this is told in a quiet, businesslike tone, so that the horror of it all is by no means obvious to the unimaginative reader. One of the most important chapters gives a detailed account, with a simplicity almost epic, of the massacre of thousands of inoffensive, peaceable Chinese in and around Blagovestchensk during July, 1900. The poor wretches were

² SIXTEEN YEARS IN SIBERIA. By Leo Deutsch. Translated by Helen Chisholm. New York: E. P. Dutton & Co. \$2.00.

first herded together and then driven at the point of the bayonet into the Amûr River, where almost all of them perished. The verbal order given by General Gribsky, military governor of the Amûr province, was as follows: "*Send back the Chinese subjects to China.*" And the fulfilment of the barbarous order was reported in the *Amûr Gazette* in the brief and guileless announcement that "the Chinese residing on Russian territory had been sent away, a suggestion having been made to them that they should cross to the other [Chinese] side of the river." History does not record that Ivan the Terrible, who had caused tens of thousands of the inhabitants of Novgorod to be sewn up in sacks and drowned in the Volkhov River, could be equally facetious.

In his latest book³ Mr. Bain has essayed the weighty task of narrating in detail the history of Russia from the election of Michael Romanov to the death of Peter the Great (1613-1725). This is the period during which barbarous Muscovy emerges from her Chinese exclusiveness and becomes a member of the European political system, and includes such events as the incorporation of Little Russia, the conquest of the shores of the Baltic, the founding of St. Petersburg, the supplanting of Poland as the leading Slavonic State and of Sweden as the foremost military Power of Northern Europe, and the final subjugation of the free peasants and the Cossacks. The book is best in those portions which deal with diplomatic and military events and court life—the superficies of history—and least satisfactory in the chapters treating of the life of the people, internal development and underlying causes. It is strange that Mr. Bain, who has used not only Russian, but also Polish and Swedish works, should have entirely overlooked the works of the German-Russians, such as Schieman and Brückner, who combine with an intimate knowledge of Russian history and literature the superior Western methods of historical criticism and a greater independence of judgment.

One who does not belong to the absolutely idle classes will not find it easy to

account for the publication of this memoir of the wife of Paul and mother of Alexander I and Nicholas I.⁴ The subject of it was remarkable neither for goodness nor for wickedness, she exercised no influence on events, and the book itself is consequently dull and uninteresting. The style is slovenly and the knowledge evinced of Russian life is microscopic.

*Russia From Within*⁵ professes to give an accurate picture of "the general conditions prevailing at the outbreak of the Russian Revolution." We do not know yet that there is, or that there is to be, a "Russian revolution," and this volume of scandal and denunciation will not in any case contribute much to the understanding of it, any more than the stories of the affair of the Diamond Necklace enable us to comprehend the French Revolution. Of course, it is interesting to read the details of the discussions in the Czar's secret council chamber and to learn the exact words used in the quarrel between General Kuropatkin and the Grand Duke Boris. It speaks well for the bureaucracy that it has stenographers on hand on all such important occasions and is willing to give this information to the public through Mr. Ular. If Mr. Bain is too lenient toward the earlier Romanovs, Mr. Ular is sufficiently hard upon the later and present representatives of the family to compensate. According to him practically all the Czars and Grand Dukes are degenerates, afflicted, among other things, with megalomania, erotomania and euphoria. Surely we ought not to begrudge them what comfort they can get out of the last-named disease.

Professor Milyoukov, formerly of the University of Moscow, but now imprisoned because of his liberal views, has given us a careful study of sociological movements in Russia,⁶ based upon his lectures in the University of Chicago on "Russian Civilization." He proves that both the cardinal tenets of the aristocratic party, autocracy and orthodoxy, have no historical justification, and that the theo-

ries of the Slavophiles are based upon illusions. Having thus undermined the conservative position, he discusses the ideas of the liberals and socialists, and explains the significance of recent political events. Notwithstanding his personal interest in the outcome of the struggle, he views the present crisis from the standpoint of the political philosopher, and criticises the virtues and defects of his fellow countrymen with remarkable impartiality. In style, temper and scholarship this book is in complete contrast to that of Mr. Ular.

A man who could produce so thorough and scholarly a work on the government and social conditions of his own country would anywhere else in the world receive high honor and public recognition, but in Russia it is different. On August 21st Professor Milyoukov and ten other distinguished university and professional men, members of the Central Bureau of the League and Confederation of Professional Reform Organizations, were arrested at his house for criticising the plan for a Duma, recently authorized by the Czar. His opinions on the inadequacy of a purely advisory assembly, such as the Duma, and the importance of security from arbitrary arrest, of which he is now the victim, are given at the end of his book in the following paragraphs:

"Russia wants a political representation, and guaranties of what are called the fundamental rights of individuality—*i. e.*, freedom of belief and of speech, the right of association and of public meetings, liberty of the press, a strict *régime* of law, and the free course of justice, which implies the repeal of arbitrary edicts and regulations, the abolition of extraordinary tribunals, and last, but not least, a habeas-corpus act—*i. e.*, security from arbitrary arrest and domiciliary search. Public opinion will not now be satisfied with a consultative chamber, and will not join the extremists who want a Federative republic and a referendum—*i. e.*, immediate legislation by the people. The great majority will be glad to have what was once claimed by the Liberals of Tver—*i. e.*, a constitution similar to that which was sanctioned in Bulgaria by the Russian Czar twenty-five years ago. One must know that the Bulgarian constitution is consistently democratic, and that it includes both of the features claimed by the democratic Liberals of Russia—*i. e.*, universal suffrage and one chamber. The habitual argument of

the Conservatives, that Russia is not ready for a constitution, is cut short by this example of Bulgaria. The broad democratic basis of the constitution of that country did not correspond to the degree of political development of the Bulgarian people; but it proved highly valuable as a means of promoting their political education, and precludes for a long time any discussion about further changes in the form of government, which cannot fail to establish a good and durable political tradition, and to concentrate all struggle within the legal frame of guaranteed institutions. Whether this example of political wisdom, which takes care, not only of the present, but also of the future, will be followed by Russian statesmen is an open question. But for a historian there is no question as to whether there will or will not be any political reform at all. History may have its whims, but it also has its laws; and if the law of Russian history is progress, as we have tried to demonstrate, political reform may not be avoided. To deny it is to despair of the future of Russia."

Modern Dramatists

THE latter part of the nineteenth century is distinguished by the fact that the most original and purposeful literature produced was in the dramatic form. Of Germany, France, Russia, Belgium, Spain, Scandinavia, Italy and England this was true; not, of course, of the United States, where we have as yet no serious drama and are only beginning to take seriously the drama of Europe. But we are beginning to discover that plays are readable. Much of the best foreign drama is now obtainable in translation, and in many small towns, which never see a play worth seeing, the great modern dramatists are better known than they are to metropolitan playgoers.

As an interpreter of the modern drama there is no one better than Mr. Huneker—not merely because he writes in such a brilliant style as to accomplish the almost impossible task of making the abstract of a plot interesting, but more because he is himself temperamentally in tune with the prevailing spirit in the modern drama, which is such that under the title of *Iconoclasts*¹ he can discuss with propriety almost all the recent playwrights worth considering.

For the *fin de siècle* drama was revo-

¹ *ICONOCLASTS; A BOOK OF DRAMATISTS.* By James Huneker. New York: Charles Scribner's Sons. \$1.50.

lutionary, destructively critical of society, seeking to break through the ring of icebergs in any direction that would lead to the opera sea. It remains to be seen whether the writers of the new century will be able to produce a creative instead of a destructive drama, a task requiring more literary skill and greater moral force and sincerity of character.

Mr. Huneker has a fondness for the bizarre, for the anarchs of art, for plays wherein, "as in the ghastly illumination of a lightning flash, souls hallucinated by love, terror, pity, despair, are seen struggling in the black gulf of night." He has an aversion to any play that turns out well in the *bourgeois* sense and an antipathy for all normal and well-behaved characters. It is unnecessary to say that these aversions and antipathies of his are not met with very often in the works of the dramatists he discusses, Ibsen, Shaw, Strindberg, Gorky, Maeterlinck, D'Annunzio, Hauptmann and Sudermann, so he is for the most part sympathetically appreciative, altho never uncritical.

Ibsen, as is his right, occupies a third of the volume, in which each play is separately analyzed. The book is, therefore, useful for reference as well as direct reading, for Mr. Huneker manages to weave into his discussion a great deal of information on the publication and presentation of the plays without interrupting its continuity. As Shaw gave us "The Quintessence of Ibsen," so now Huneker exposes the "Quintessence of Shaw," and, what is of especial interest, he gets from Shaw himself an interpretation of "Candida," which fascinated and puzzled New York two years ago and led to the present rage for all the rest of his plays. Another important essay is that on the "Night Refuge," the lowest depth in the social strata to which the drama has penetrated, written by one who is recorded on the Russian prison rolls as "Alexis Pyeshkov, artisan, of Nizhni-Novgorod," but is known to the world as "Maxim Gorky." The play was given in New York last winter in German and will be given this winter in Russian. Mr. Huneker, in our opinion, misses the point of Gorky's drama through failure to comprehend the significance of Luka, the Tolstoyan pilgrim.

A book of a very different kind and caliber from the one we have been considering is the *Dramatists of To-day*.² Mr. Hale chats interestingly upon many of the same subjects as Mr. Huneker, altho he substitutes Rostand for Ibsen, but what would be good impromptu conversation is poor reading. Mr. Hale tells us in a pleasant way what he likes and doesn't like, what he has read and what he has neglected to read, but he gives us no grounds for thinking that these things are of sufficient importance to the world to justify publication. The following quotations are not exceptional examples of his literary style and mode of thought:

"Problems, as such, are not especially good subjects for plays. Plays deal with life, and life does not consist very largely of problems."

"A good deal of Mr. Maeterlinck's dramas has been held to be symbolic. I cannot attach much importance to this opinion. A symbol is not an effective mode of expression."

"I am sorry to say that of it I can read only about one word in four, which gives me but a fragmentary idea of what it presents."

"These figures were very beautiful to me once. If I read the play again they would be beautiful once more. But beyond that they have their significance. I cannot now remember just what they did signify to me once."

The Life of Shorthouse.

IN view of John Henry Shorthouse's literary production there seems very little reason for the compilation of these two volumes of life, letters and remains.* In a more exact sense than is true of Flaubert himself Shorthouse is the author of a single book. And even "John Inglesant," by however close a shave, still falls short of greatness and has had, besides, but little influence on English letters. The justification for these memoirs, then, if it is to be found anywhere, must be sought in the man's life and in his romance only as far as it is a reflection of his opinions.

In one way that life was a protest. In the thick of an industrial society, with its mingling of commercialism and humanitarianism—he was born and

² DRAMATISTS OF TO-DAY. By *Edvard Everett Hale, Jr.* New York: Henry Holt. \$1.50.

* LIFE, LETTERS AND REMAINS OF J. H. SHORTHOUSE. Edited by *His Wife.* New York: The Macmillan Co. 2 vols. \$4.25.

brought up in Birmingham and was himself heir to a chemical works in that city—he may be said to have stood for “the unpopular doctrine that the end of one’s existence is not the good of one’s neighbor, but one’s own culture.” Indeed, his position cannot be defined better than in his own words:

“But surely, in a wider sense, a man who has successfully cultivated himself, and is living a life of culture, having conquered and secured for himself peace of mind and a solution of the difficulties which have perplexed his life, cannot be said to do nothing although he may not give himself to coffee houses, or Sunday schools, or Liberal organizations (all very good things in their way).”

It may be that this lack of harmony with the aspirations of his age will account for that trace of semi-futility which characterizes him—the faculty, we mean, of coming very near the best without quite reaching it. At all events this peculiar attitude of his, with its reserve toward things outward and active, together with his devotion to the Church of England, for which he deserted Quakerism, gives him a kind of detachment which one is likely at first sight to call religious. On the whole, however, it would be a mistake to call him religious rather than philosophical, as the comparison with such a nature as Pascal’s shows. He was divided in a very singular fashion between the worship of the good and the worship of the beautiful. And at the same time his devotion seems to be quite as much ideal as real—that is to say, he does not appear to distinguish very closely between the conceptions of his own mind and the facts of actual existence. In the matter of Christianity, for instance, it would seem to be quite enough for him if it were, so to speak, true only metaphorically. And this curious attempt, as it were, to reconcile Platonism and Protestantism, while it makes his thought difficult and elusive, does at the same time and for that very reason lend it an additional attraction and interest.

The Gifford Lectures

THE late Lord Gifford did a somewhat remarkable thing when he endowed lectureships at the four Scottish universities, the purpose of which was to “in-

quire into the nature of God,” the inquiry “to be executed impartially, and in a scientific fashion, without fear and without favor.” The distinguished scholars appointed on this foundation have included representative authorities from Germany, France and the United States as well as from Great Britain, and it is not too much to say that several of them have contributed works which have permanently enlarged and enriched our knowledge of the central problems of theology.

The merit of the present work* does not lie in originality of thought, but in the author’s mastery of the doctrine of Absolute Idealism and in his skill in presenting it in an unacademic and untechnical form. Mr. Haldane is a distinguished Member of Parliament, a man of affairs. He chose to deliver his lectures *extempore* and prepared them for publication from the stenographer’s report. They possess, in consequence, a directness, simplicity, fullness of illustration and close approach to a conversational style quite unusual in metaphysical discussions.

A preceding course of lectures (session of 1902-03), the author reminds us, had established the truth that the Ultimate Reality is God, the Absolute Mind. The purpose of the present course is to exhibit the nature of mind, both the Absolute Mind (six lectures) and finite mind (four lectures). Mr. Haldane’s general position is frankly that of the Absolute Idealism of Hegel, a view which, he contends, is also implicit in the poetry of Goethe. The author deals in a helpful way with the popular misconception that Hegelianism is pantheistic, and there are some large and suggestive views on Death and on the meaning of Eternal Life. The special point about the “Pathway” to reality is that thought is not by itself adequate to teach us what reality is, but that the vital experiences of moral conduct and the enjoyment of the beautiful are just as essential.

There is an excellent analytical Table of Contents. The letterpress and two admirable engravings, one of Goethe and one of Hegel, are highly creditable to the publishers.

* THE PATHWAY TO REALITY: STAGE THE SECOND. *Being the Gifford Lectures Delivered in the University of St. Andrews in the Session 1903-1904. By the Right Honorable B. R. Haldane, M.P., LL.D., K.O.* New York: E. P. Dutton & Co. \$3.00.

John Knox

FOR one who makes so considerable a figure in history, both ecclesiastical and political, and whose contributions to the literature of his age are not small, it is remarkable how many things in the life of John Knox are legendary and uncertain. There is a conventional agreement among Scotchmen to celebrate this year 1905 as the four hundredth anniversary of his birth, but it is doubtful whether this date is not ten years too early, and the place of his birth is in like uncertainty. If he was born in 1505 it brings him into that very small class of exceptional great men like Cromwell, who spent forty years of life before giving signs of greatness. Professor Cowan's book* is devoted, with much antiquarian zeal, to the study of these and other doubtful points in Knox's history. If one is seeking to know *about* Knox he will do well to get this volume, with its copious photographic illustrations. If, on the other hand, he is seeking to know Knox himself, "his ideas and ideals," he will find more of what he wants in Dr. Stalker's book,† which is characterized by large and sometimes highly illuminating extracts from Knox's writings. We need not be surprised, knowing the author's point of view, at finding the Reformer set before us in the character of a somewhat liberal theologian, with liturgical tastes, and not an exponent of the Presbyterian system of church government. It would be an instructive task, and not a difficult one, to show how the students of Calvin's town church at Geneva changed the substantial Congregationalism of his polity when they expanded it to the dimensions of a kingdom. It is like the revolution that overcame the episcopate when its domain, instead of a town, became a principality. Knox's Book of Discipline, "the most remarkable document of that age in Scotland," is characterized, says Dr. Stalker, "by the almost total absence of the Presbyterian system of Church government."

* JOHN KNOX. *By Henry Cowan, D.D., Professor of Church History at the University of Aberdeen. Heroes of the Reformation Series.* New York: G. P. Putnam's Sons. \$1.35.

† JOHN KNOX: *His Ideas and Ideals.* By James Stalker, D.D., Professor of Church History, United Free College, Aberdeen. New York: A. C. Armstrong & Son. \$1.00.

The John Knox of Andrew Lang‡ is a very different person. Professor Cowan entitles his book "The Hero of the Scottish Reformation," but, according to Mr. Lang, he was no hero at all, but a tricky and spiteful politician, lacking in personal courage, unreliable as an historian and the cause of many of Scotland's troubles. If the biography had been written by an American he would have called it "The True John Knox," for it is one of the books commonly entitled in this form that present the valet's view, with the worthy object of preventing people from being led into the sin of idolatry. Such books show us, not why a man was great, but in what respects he failed of greatness. Of the "Ideas and Ideals" of John Knox, his intellectual and spiritual achievements, which fill more than half of Professor Stalker's work, Mr. Lang has very little to say. He states in his preface that Knox was a great man, but one who had only read this book would certainly not get that impression. A Scotchman cannot forgive Knox for his impolite language to Queen Mary, and many of Knox's views which shock a loyal subject of King Edward VII do not seem so bad to an American; such, for example, as that churches should have the right to choose their own ministers, that a Christian may be compelled by his conscience to disobey the rules of his ecclesiastical superiors, and that a people may rightfully take up arms against a sovereign.

Most of what has been written about Knox is based upon the standard biographies of M'Crie and Brown, but in this new work Mr. Lang has gone behind these and made a critical study of the original material, and there are few scholars who are competent to challenge any of his conclusions.

The Story of St. Paul: A Comparison of Acts and Epistles. By Benjamin Wisner Bacon. Boston: Houghton, Mifflin & Co. \$1.50.

There is no more fascinating problem in the study of the New Testament than the comparison of the Acts of the Apostles with the Epistles of Paul. Not only

‡ JOHN KNOX AND THE REFORMATION. *By Andrew Lang.* New York: Longmans, Green & Co. \$3.50.

the worth of the Acts as history is at stake, but the entire conception of the spirit of early Christianity depends upon this study. A clear and interesting account of the difficulties in reconciling the Acts with the Epistles and the modifications which must be made in the popular idea of the Apostolic times are presented in the University Extension lectures of Professor Bacon, now published in convenient form. Six of the lectures sketch the career of Paul from his conversion to his imprisonment at Rome, as outlined in the Acts, with corrections and additions from the Epistles, and the remaining four lectures interpret the Epistles, with paraphrases of the more important sections. Professor Bacon has thought the problems through, and while he calls his book "semi-popular," it is perhaps the clearest and ablest presentation of its particular subject yet made by an American scholar.

The Middle Ages: Sketches and Fragments.
By Thomas J. Shahan, S.T.D., J.U.L.
New York: Benziger Brothers. \$2.00.

The book before us is no collection of merely historical or literary essays, but it has been written with a purpose: to rehabilitate the Middle Ages and the great Church which was then the predominant intellectual, spiritual and temporal power. It sets forth the rôle which the Church played in medieval life as a religious institution and disseminator of Christianity, as the preserver of knowledge and as the teacher of the arts of life, of industry and politics to the barbarian converts. It dwells in particular on the important function which the cathedrals and monasteries fulfilled as nuclei of city life. It goes without saying that the book is one-sided. There is but little sympathy shown for Byzantine civilization, and still less for Arabian civilization. In these respects, however, the book sins more in its general statements than in statements of fact; and, indeed, the latter show quite frequently a good knowledge and just estimation of the debt that modern civilization owes to medieval Greek and Mohammedan. But this only makes the contradictions between the general and

detailed statements all the more glaring. An error of a similar nature is indulged in the treatment of the Reformation. The author contends against the current notion that the great revolt against the Church was due to its debilitated, decrepit and corrupt condition. But he does not try to reach down to the underlying social causes that made the revolt inevitable. He ascribes it to the cupidity of kings and nobles for the possessions of the Church. One narrow view is opposed to another. Notwithstanding this, however, there is much useful and minute information in these essays, especially in the two entitled, respectively, "The Results of the Crusades" and "Catholicism in the Middle Ages."

The Fool Errant. By Maurice Hewlett.
New York: The Macmillan Co. \$1.50.

This is the story of an eighteenth century Galahad who went to Padua in search of learning and who found a woman instead. This often happens to a young man, especially if he is of the Sir Galahad temperament. This particular woman had remained innocent from force of circumstances, but she was really a mature Cleopatra, subconsciously waiting for any Antony who might land upon her shore. The comedy consists in the fact that the gallant youth mistook her for a Madonna and she misread him for a prospective Antony. Both were correct in their ideality of each other, but short in the matter of facts. Such characters are becoming stock features in Mr. Hewlett's novels. He takes his heroines from the back centuries and intimates that they were naturally less moral than the men were. They have that kind of innocence which is based upon a profound unconsciousness of their own wickedness. And while we may accept the woman as a veracious creation, the Galahad youth who could not distinguish between the lotus-eyed smile of a scarlet woman and the gift of radiance in a saint's face is nothing short of apocryphal. Many think Mr. Hewlett comes nearer making a fine art of fiction than any other living writer, but he is in danger of portraying the same subjects and of producing the same effects too

often. One does not grow weary of a masterpiece, but too many variations cheapen the original conception.

The Christian Ministry. By Lyman Abbott. Boston: Houghton, Mifflin & Co. \$1.50.

Dr. Abbott was the Lyman Beecher lecturer at Yale in 1903 and lectured also on the Earl Foundation before the Pacific Theological Seminary in Berkeley in 1904, and the present volume embodies the material of those lectures. It is designed for ministers and contains much that is stimulating and interesting concerning the work of a preacher and pastor. It contains also many statements apparently clear which will bear careful questioning. For example, Dr. Abbott assumes Max Müller's definition of religion and builds a great deal upon it. That definition reads: "Religion consists in the perception of the Infinite under such manifestations as are able to influence the moral character of man." But perception is a term used generally to signify an apprehension of a particular object manifest through the senses, and is properly applied only to objects a good deal smaller than the Infinite. It is confusing to speak of God as an object of perception, and it cannot be admitted that "if he (the Infinite) is not really perceived there is no real religion; there is only deception or an illusion." There are many devoutly and honestly religious men who could not say that they had ever really perceived God.

Shelburne Essays. Second series. By Paul Elmer More. New York: G. P. Putnam's Sons. \$1.25.

It is hardly necessary to review in detail this second series of Mr. More's *Shelburne Essays*, the first of which was considered here at some length only a few months ago. Against Mr. More's work as a whole there are several objections that might be urged with some show of justice. His manner, while sound, is rather lacking in creative power, so that his portraits, tho often just and occasionally shrewd, are not always very much alive; he is inclined to abuse the comparative method to the detriment of historical perspective, and he is still too fond of ringing the changes upon Oriental philosophy. This second

series is singularly uneven. It is a far cry, for instance, from the article on George Meredith to the penetrating analysis of Lafcadio Hearn, or from the comparison of Kipling and Fitzgerald, for that matter, to the untrussing of Shakespeare, for as such no doubt it will be regarded, tho the apparently revolutionary tendency of the paper hardly disguises its essential moderation and justice; while the two essays on Greek subjects have little discernible congruity with the rest of the volume. The opening piece, on the Elizabethan sonnet, is unsatisfactorily indefinite and abstract, and the discussion as a whole overlooks or neglects entirely the individuality of the several sonneteers. The essay on Hawthorne fails in its final genealogical deductions to comprehend or at least to take account of the deeper currents of New England character. But when all these things have been urged, as they have been already by one reviewer and another, they leave the essential merit of Mr. More's work untouched. What distinguishes his criticism is the expression of an individual temperament which interprets life through literature without losing the distinction between the two and in maintaining its own point of view. All criticism that amounts to anything or that stands a chance of lasting any time at all reduces to just this: the development of a personal philosophy of life. Those who like the temperament will like the criticism. We have shown our own appreciation of the value of Mr. More's work by publishing many of his critical essays in *THE INDEPENDENT*, some of which are included in the present volume.

Young Men Who Overcame. By Robert E. Speer. Fleming H. Revell Co. \$1.00.

Loyalty the Soul of Religion. By J. G. K. McClure, D.D. Fleming H. Revell Co. \$1.00.

While there are those who seem to think that Christianity is a weak and unmanly thing, yet as a matter of experience to follow Christ's teachings demands more real manhood than most men can give. Mr. Speer uses "sketches of the lives of fifteen real men, who loved the highest and made duty the first thing in their lives . . . as a challenge and a contradiction to those

who think Christianity a weak and unmanly thing." Every young man who reads this book will see at once that a demand is made upon all that is best in him if he will live such a life as is set before him in each one of these examples. In his "Talks to Young Men" Dr. McClure gives some very wholesome and stimulating addresses, which should be helpful to all young men in the formation of character. He says: "The one vital requirement of Biblical religion is the requirement to live true to the truth." This he develops in twelve addresses on "Loyalty."

A History of Preaching, from the Apostolic Fathers to the Great Reformers, A.D. 70-1572. By Edwin Charles Dargan, D.D., LL.D. New York: A. C. Armstrong & Son. \$1.75 net.

Professor Dargan is the successor of Dr. John A. Broadus at the Baptist Theological Seminary of Louisville, and has followed the example of that great teacher of homiletics in lecturing on the character and achievements of great preachers as well as on the preparation and delivery of sermons. The present volume of 575 pages contains much valuable material, with bibliographical references concerning the preachers of the Christian Church down to the death of John Knox, and will be valuable as a book of reference. It is, however, somewhat discursive, and fails in sharp characterization of the personality of the great preachers and their particular message to their time.

Literary Notes

A NEW edition of Baedeker's Belgium and Holland is sold by Scribners at \$1.80. There is nothing to say about Baedeker's guide books except that they are indispensable.

....A book on the significance and history of "Girls' Christian Names" is published by E. P. Dutton & Co., New York, at \$1.50, which will be a boon to perplexed parents of girl babies.

....Even experienced letter writers will find it convenient to have on hand for reference the new edition of the "Etiquette of Correspondence," published by A. Wessels Company. (50 cents.)

....Colonel McClure's popular book on "Our Presidents and How We Make Them" is now brought down to date by the inclusion

of the Roosevelt-Parker contest of 1904. (Harper, \$2.00.) A good book for the public or school library.

....For the spelling, pronunciation and definition of geographic names Lippincott's *Gazetteer* has long been the most convenient and comprehensive reference book on the market, and our readers will be glad to know that a completely revised and expanded edition of it will be published in November.

Pebbles

It is not the tainted money that goes into the hands of clergymen that need worry us so much as the tainted money that goes into the hands of politicians.—*Puck*.

...."The baby always becomes perfectly quiet when I sing to it," said the proud young father. "Yes," answered the mother, "it knows that if it makes a noise you will keep on singing."—*Washington Star*.

...."I've been here at the seashore three weeks and my hands aren't tanned a bit. Funny, isn't it?" mused the engaged girl. "Oh, I don't know," remarked her fiancé; "they've been in the shade of my sheltering palms most of the time!"—*Detroit Free Press*.

....He had asked for Washington cake, and the waiter brought him chocolate cake. "Do you call this Washington cake?" he asked. "Sure," was the reply. "Indeed? But what I wanted was George Washington cake, not Booker."

....Amid the new surroundings just outside Eden's portals, soon after the dispossession, Adam was taking an optimistic view of the situation. "Never mind, dear," said he to Eve, who was busily engaged in refashioning a girdle of fig-leaves; "it was a pleasant enough place, I must admit. But, after all, it afforded us but little more than a bare living." Thus was the first joke of history sprung upon an unsuspecting world.—*Judge*.

....In looking over the life history of that enterprising and successful bigamist, Johann Hoch, the reader will be struck by the fact that his celebrity as a husband began with a little fifteen-cent want ad. Surely every business man will catch the idea here without a diagram. Advertise if you would go to the top in any line. Hoch might have worried along and achieved an ordinary, little, inconspicuous, seven-by-nine, tandem bigamy; but he never could have reached his splendid world wide eminence and written for the Sunday papers without this great aid to success, the want ad.—*Judge*.

Editorials

A Menace to American Morals

IF there is one thing rather than another upon which the American people has vaunted itself, that thing is morality. The austere influence of Puritanism has spread from Salem throughout a wide belt of Northern States to the Pacific Coast, and the not less austere influence of Scotch-Irish Presbyterianism and of Wesleyanism has permeated the South. Pleasures that the Continental peoples of Europe look upon as either innocent or not seriously evil have been frowned upon here as allurements of Satan. And, all in all, the standard of American morality has been high. Probably as large a proportion of our people as of any people in the world has been honest, temperate, forehanded and decent.

Very moral people are apt to be conscious of their virtues, and we have been conscious of ours. Whatever "fears for the future of the republic" an occasional pessimist may have suggested, they have not sprung from any doubts that we have entertained upon the stern chastity of our manners.

It may seem, therefore, quite like gratuitous croaking to declare that the chief danger now threatening American civilization is a general deterioration of morals and to say that one condition in particular is a serious menace to such morality as we still may boast of. But let us look at the facts.

A deterioration already apparent is revealed not in such laxities as the growth of beer drinking and the conversion of the New England "Sabbath" into the "Continental Sunday"; it is revealed in the transformation of a nation of once honorable, patriotic citizens into a nation of "grafters." Professor Sumner's clever aphorism, "that every man is a sovereign, but that a sovereign cannot take tips," has become a gem of archaic philosophy. When its author cut and polished it the only grafters that we knew anything about were the Indian agents, the star-

route contractors, a few bankers and Congressmen, while mere tip taking was regarded as "foreign," "effete" and ungentlemanly. Now it would seem as if we are all grafters, as if gentlemen of all professions and occupations carry their itching palms open behind them, with their fingers instinctively feeling for drachmas. Professor Sumner should revise his phrase to read that **every American is a sovereign, and every sovereign is a grafter.**

However, this deterioration of American morals, serious and deplorable as it is, is only a beginning of the depravity that we are likely to see before certain social forces that are rapidly being generated have wrought out their inevitable effects.

One of these forces is the passionate hysterical emotionalism that manifests itself in race and class hatred, mob action and lynchings; in "crazes," "fads" and "isms." Whatever else morality is, it is at any rate a mode of self-control. Its precepts may be narrow, its exemplars may be bigots, its underlying philosophy may be arrant stupidity, but it certainly is not an individual or collective hysteria. The moral man, whatever else you may say of him, at least has himself in hand; and no people can long boast of its morality, or have any morality to boast of, when it has once surrendered itself to spiritual jimjams. Just what kind of drink has produced these phenomena of moral inebriety throughout whole sections of the American population it might be difficult to say; but there is no denying the fact that in one way or another we've "got 'em."

The other social force that is bound to work the mischief with us is one of a very different character. From time to time we have commented upon the astonishing fact that a people which spends millions of dollars annually upon education is nevertheless a people that takes almost no interest in substantial literature. No other people in the world boasting of its intel-

ligence has so small a percentage of readers of serious books. The proofs that back up this assertion are notorious and overwhelming. For example, there are at least twenty thousand somewhat pretentious public libraries in the United States, not counting the little ones. If one-half of these bought one copy each of every standard book that is published there would be a market for any volume of genuinely scholarly or scientific quality. There would be a sufficient sale to pay the author and the publisher for the labor and expense of producing it. As a matter of fact, there is almost no market for such books in this country. New York publishers say that the public library call for a high grade book seldom takes up an edition of more than two hundred and fifty or three hundred copies. The reading of one-half of the American population consists of ephemeral novels and newspapers. The reading of the other half consists of the nickel magazines and "scare heads."

The bearing of this fact upon the future of American morality may not be obvious, but it is real and direct. If a people has no intellectual resources, what is to become of it when it gets rich and commands leisure? How will it kill time? History has given us the answer to this question over and over again. It will do the sort of things that the luxurious, licentious Romans did and that the intellectual, artistic Greeks did not. It will consume its substance and its manhood in material, enervating pleasures, not in creative activity.

Already we see abundant signs, in the inner, esoteric, monkey-dinner circle of the American smart set and elsewhere, that this is the fate in store for a large proportion of the inordinately rich class in the American population, and that the other classes intend to rush on the same fate by imitation if they can. We are developing a kind of American who can be described only as an automobile-racing, bridge-whist-playing, champagne-drinking, mistress-keeping fool. His father had brains enough to get money—not to make it, please observe; other people made it;

he only got it—but "the second generation," as Mr. Jerome calls him, hasn't brains enough even to steal without being caught in the act.

Happily, there is still a large hard-working and well-meaning, if somewhat philistine, middle class in America which is not yet corrupted by the example of its "betters." The danger that threatens it, and that should be combated by every influence that the intellectual class can bring to bear, is that which lies in vacant-mindedness. The salvation of American society lies in the possibility that this people can, even yet, be taught to read and to think. But it will be a big job.

The Great Bluff

It is a game of bluff that is being played at Portsmouth. Two nations are the players. Japan holds all the best visible cards and she knows it. But Russia seems to possess the largest bluff, where both are skillful at it. Both sat down to the game, one with "irreducible minimum" and the other with the profession that it was impossible ever to yield up honor. One said: "We have beaten you in every battle; we have captured your chief fortress; we have driven you past Mukden; we have sunk your fleet; we have captured Sakhalin." The other said: "We are not beaten; we have a better army than ever and better officers; we are nearer our base, while you are farther, and the tide of war is on the turn; we shall never yield; we shall yet make peace in Tokyo." So they sit and bluff. Possibly they will bluff too long.

But Russia has thus far bluffed the best. Japan has yielded to the extent that she consents to give up half the island of Sakhalin for a price which shall not be called an indemnity, but purchase money—say a little over half a billion dollars for Sakhalin and the support of prisoners. This yields more than was to be expected, but as yet Russia holds to her bluff. She utterly refuses. She would rather fight it out for ten or twenty years than give up a foot of territory or pay a kopeck of money that has the suspicion of indemnity. Does she mean it? Is she in earnest, or is it more bluff?

To the outside observer it looks like bluff for better terms and that she must yield in the end. But you cannot prophesy of things Russian, because it is not the land of sound reason. How is Russia going to keep up a war of ten or twenty years? Her financial credit is gone. She can get no more loans in France, nor anywhere else, except on special security, if at all. Her people have no heart in the war, but are in revolt at home. Linievitch is sending back to St. Petersburg glowing accounts of the spirit of his soldiers and the strength of his army and the certainty of victory, but to the world outside it all sounds like more bluff. What chance has Russia for better terms if she refuses those that are offered now? Not the least, unless she wins a most improbable victory in Manchuria. Let there be one more battle which shall give Oyama the success he has invariably had hitherto and Linievitch must flee, like Kuropatkin, to Harbin, and lose all connection with Vladivostok. Then that port will fall, and all the Amûr province behind it. The whole Pacific littoral will be lost and won. After such a victory over Linievitch Japan will never again consent to yield to Russia half of Sakhalin, or to leave her in possession of Vladivostok. She will hold what she gets up to the Arctic Sea, island and continent. No more Russian fleets shall harbor in the Pacific. On the one side the United States will guard that Ocean and on the other Japan, and Russia will sink to a second-class Power for a term of years until she can recover, by improved internal conditions, what she has lost by the folly of deluded ambition. De Witte will return to Russia and sit and glower at Alexieff and repeat the sad refrain, which he has already begun to utter: "I told you so; I told you so!"

President Roosevelt would have the bluff ended. So says all the world, unless we may be in doubt whether the Emperor William would have his dangerous neighbor, which set Prussia on its feet and so made Germany possible, keep on fighting for honor until utter exhaustion. Nobody knows his mind. But Roosevelt's advice is more disinterested than William's, tho it is not so likely to be heeded.

German and American Dress Reform

It was only about a year ago that America became aware of the German dress reform movement. The curious glances, or, perhaps one should say, the stares of the crowd, at the St. Louis Exposition were directed toward certain ladies, wives of distinguished German representatives at the Congress of Arts and Sciences, as they paced the Terrace of the Fourteen States dressed in rich, flowing robes, in marked contrast to the ordinary tourist costume. And then our American ladies who attended the World's Congress of Women at Berlin came back with much to tell of the new and artistic gowns worn by a large number of the advanced women at the sessions and receptions of the Congress.

From the account given by Frau Oppler on page 487 it appears that the German dress reform movement is largely due to two motives, patriotic and artistic. The same desire to be free from foreign influences which led the Kaiser to taboo the use of all French words in the postal service and to oppose the gradually extending adoption of Roman type moves the German women to devise costumes more suited to the national taste and character than those designed in Paris. In this they have succeeded, for the new gowns, both in material and cut, show somewhat too much of the heaviness characteristic of German sculpture, architecture, painting and handicraft to suit our taste. The costumes seem to be printed in black-letter. The American woman, if she ever designs her own gowns or consents to have them designed for her, will probably develop a costume somewhere between the German Gothic and the French Rococo, but marked, of course, with that individuality and charm which makes the American woman so superior to the rest of the sex.

In our country this patriotic motive has been absent, and the artistic impulse has so far not extended to apparel. The American woman has allowed and even encouraged the artistic craftsman to remodel her furniture, wall paper and books, but she makes him keep his hands off of her dress.

But altho the two motives prominent in the German movement have been absent here and altho the Jenness-Miller crusade, which bore the strongest resemblance to that described by Frau Oppler, was an apparent failure, nevertheless dress reform has made more progress than is generally realized. Much that the German women are now fighting for American women have already attained; for example, the shortening of the skirts on walking gowns, underwear that is both hygienic and comfortable and fewer and lighter skirts. In fact, the modern woman's costume is less hampering and burdensome and more healthful and modest than at any previous period in the memory of the oldest female inhabitant. The modern woman would feel as uncomfortable in her grandmother's corset as the modern man in medieval armor. The teaching of physiology and hygiene in the public schools, altho it has not eradicated the feminine vices any more than it has the masculine, still has had some effect. College women as a rule have used their influence on the right side. The athletic girl has to a certain extent counteracted the society girl.

But all these apparent gains are liable at any moment to be snatched away by the caprice of Fashion, who is as arbitrary as the Trust. Already we hear that a reduction of four inches in the waist has been ordered, and this will involve the throwing out of employment of millions of lung cells, in the season, too, when they are most needed. Against a decree from such a power as this no appeal to reason is likely to prevail. It is of no use to argue that tight lacing has caused more injury, physically and morally, to the human race than alcoholic liquors, because no woman can be found who laces tightly, just as no man drinks immoderately. Legislatures pass anti-cigarette laws to protect the boys, but not anti-corset laws to protect the girls.

It shows the superior altruism of the female sex that women are willing to organize societies to fight the vices of men, while men make no similar efforts against the vices of women. We have known of a few clubs of young men who have mutually vowed never to marry girls who wore corsets, but they did not proclaim it in public after the manner of

the modest maidens who sing at temperance meetings "Lips that touch liquor shall never touch mine." For some reason these societies did not grow, multiply and federate like the women's anti-vice societies. Some of the men lived up to their vows, either remaining bachelors or marrying women of normal proportions. Others violated the pledge upon the slightest temptation or what seemed to their associates the slightest temptation. But we must not be hard upon these recreants. Doubtless they, like the women who marry tippling lovers, took pity upon the slaves of a bad habit and married the girls to cure them of it, or literally to reform them.

It is sometimes argued that since women dress to please the men, therefore the men are responsible for the defects and absurdity of woman's dress. This is a fallacious argument. We shall not dispute the first proposition, so flattering to masculine pride, but the second is not a logical deduction from it. For, altho it may be true that women dress to please the men it is also true that any way the women dress does please the men. Whether woman wears lip-rings, nose-rings or earrings, he thinks her beautiful. Whether her shoulders slope up or down, whether she resemble an H, an X, or an A, whatever her form may be in any particular year, he thinks that form perfection. Altho the equator may shift from the Tropic of Cancer to the Tropic of Capricorn, it always divides the polar distance into its most artistic proportions.

The individual man, not having any taste of his own in dress because he has never had a chance to use it, is obliged to accept as his guide in feminine costume the standard of Fashion. He decides that his wife is fittingly dressed when her gown looks new, expensive and like every other woman's, or more so.

William Morris and other artist-artisans of socialistic ideas have been criticised for devoting themselves to expensive and exclusive forms of handicraft under aristocratic patronage. The incongruity is obvious, but the wisdom is apparent. To get a report circulated quickly tell it as a secret. To make a book sell well publish it first in limited *édition de luxe*. To make a new art popu-

lar start it as a fad of the rich. We look up and not down for our fashions. So the German dress reform movement stands a much better chance of influencing the people because at present the reform costumes are more costly and exclusive than those in fashion.

A Dubious "Dubium"

WHEN Leo XIII appointed a Biblical Commission of leading Catholic scholars the world over to consider what is the proper teaching or liberty of the Church in the matter of biblical criticism, it was hoped that some more considerable liberty might be granted. Especially in France was there a liberal section in the Catholic Church that was in hearty sympathy with the progressive views. But the condemnation of the teachings of Abbé Loisy gave no assurance.

During these years the Commission may have held many sessions, but it has made but two decisions, the second just issued. The first was to the effect that Catholic exegetists must not explain what seem to them historical inaccuracies in the Scriptures on the theory of "documents," that they are "tacit quotations" from earlier uninspired authors. This did not deny that there might have been such "documents" written by J, E, and other sources, but it left it to be the doctrine of the Church that such documents were indorsed by the inspiration of the author of the biblical books.

Now comes the second decision. Another explanation which exegetists have sometimes adopted to get over historical difficulties is to suppose that certain parts of the Old Testament which are on their face historical are really moral tales written for religious effect, like a Sunday school book. This also the Commission now condemns. This decision is in these words (we translate), giving first the "*Dubium*," or question, and then the answer:

"*Dubium*: Whether the opinion can be admitted, as a principle of correct exegesis, which holds that books of Holy Scripture, which are regarded as historical, either in whole or in part, do not at times narrate history properly so-called and objectively true, but only present an historical form for the purpose of signifying something different from the prop-

erly literal or historical meaning of the words

"*Answer*.—Negative; except in a case, not easily or rashly to be admitted, in which, the sense of the Church not opposing it, and retaining its own judgment, it may be proved by solid arguments that a writer of the Hagiographa has wished to give not true history properly so called, but under the appearance and form of history to set forth a parable, an allegory, or some sense remote from the properly literal or historical meaning of the words."

This is decidedly interesting, and while it gives some liberty, it excludes some very desirable freedom of research and opinion. Let us see what is involved in the very general statement.

Only in the Hagiographa can this liberty of interpretation be allowed, and then only in a limited way, guarding the superior decisions and authority of the Church. Now by the Hagiographa is meant the books contained in the last of the three sections into which the Hebrew Old Testament is divided. These books are, Psalms, Job, Proverbs, Daniel, Ezra, Nehemiah, Ruth, Esther, Canticles, Lamentation, Ecclesiastes and the Chronicles. It is something to exclude these books. Accordingly, so far as the Church has uttered no specified objections—we wish they were codified—one can argue, guardedly and not "rashly," that Daniel in the lion's den, Job and his three friends and Esther and Ahasuerus are parables or allegories, stories told for a religious purpose, and were so meant by the writers. But this cannot be told of Jonah in the whale's belly; for Jonah belongs to the section of the "Prophets," and not to the "Psalms" section. Of course, the same holds of Deuteronomy and the rest of the Pentateuch. As to their inerrant historic character there must be no discussion.

This is the viciousness of the decision, not the critical or dogmatic opinion which these men have reached, but their decision that such an "opinion cannot be admitted." What right have a dozen men, nominated by no matter how good and venerable ecclesiastic in Rome, to say what opinions other men can be allowed to hold and teach? It is the clash of free discussion that discovers truth. Intellectual torpor is the natural fruit of such interdicts. Such decisions as these two are a strangling noose about the neck

of the Catholic Church, and we hope, if such are its decisions, that it will be five years before it will utter another.

'The Cotton Gamblers

THE cotton leak is one of those most disagreeable events which prove that public graft is not a purely Russian institution. An officer of the Agricultural Bureau sold the information as to the cotton crop in advance to speculators, a disgraceful act, and the remarkable thing is that no law has been found which seems to cover such a crime. There are special and particular laws enough, but none of the general nature which meets this case, unless in some way or other he may be found guilty of conspiracy. Of course, the law will be made to fit the crime in future cases, but there should be some general statute to cover unanticipated offenses; for this is not like the crime of parricide, so improbable that a code of laws can omit it.

It is a very serious question whether the Agricultural Bureau is not going beyond its proper sphere in making its monthly reports, with estimates of the probable cotton crop. It is an admirable thing that it should collect reports of the condition of the crop here and there, of the weather, of the acreage, and publish them frequently, even every day; but it is another thing that it should give out an estimate, with the weight of the Government's authority, as to how many millions of bales may be expected.

The effect of such estimates on the market is very bad and the reason is plain. The New York Cotton Exchange is not a true board for the buying and selling of cotton; it is a big gambling place. It is very different from the Cotton Exchange of New Orleans or Liverpool, which do a really legitimate business. In the New York Cotton Exchange big brokers know nothing of cotton; they would hardly know a bale if they met one on the street. They make no *bona fide* sales for delivery of cotton. Theirs is a pure gambling game, as truly as could be met with at Canfield's in Saratoga. It is all on margins for a rise or a fall. Sully and the rest of them are bulls and bears, whose business it is by

all means, fair and foul, to raise or depress the price of one of the most essential commodities on which civilization depends.

Go into the Cotton Exchange when its members are awaiting the Government estimate. The chairman holds a piece of paper in his hand. He begins to read: "Ten"—instantly there is bedlam. They do not wait for the rest of the sentence—"million bales." They are shouting to catch the profit on the announcement. The price mounts instantly. Terribly irregular has it been, to the great injury of the mill men. Take an average fair price of ten cents. Within two years it has mounted up to seventeen and eighteen cents, and fallen to seven cents, and that is destructive and is done by gambling, helped amazingly by the estimates from the Agricultural Bureau. Let the Bureau report conditions and then let the brokers make their own estimates; and the bulls will put the estimate down and the bears will put it up, and there will be none of these extraordinary fluctuations encouraged by the Government and tempting to this offense, on which we hope some kind of law may be discovered.
